MUSHROOM to OZONIDES

MUSHROOM. The well known, edible, umbrella-shaped fungus which is grown for the market and commonly served as a delicacy is called by many people "the mushroom." Botanically it is known as *Agaricus campestris,* or by some authors as *Psalliota campestris.* In the temperate regions of the earth it is often found growing wild, in pastures, lawns, golf courses, etc., where the grass is kept short and the ground is enriched by manure. Restriction of the name mushroom to this fungus alone is not in accordance with the terminology accepted by botanists, nor in most regions does it correspond with popular usage. Hundreds of other umbrella-shaped fungi occur in nature and are to be found in numbers unbelievable to those who have not made a deliberate search for them. These differ from *Agaricus campestris* in minor characters of form, structure, and colour. Many of them are edible, a few are deadly poisonous, others are too tough or unpalatable to serve as food. The botanist calls all of these mushrooms. Such umbrella-shaped fungi in most cases bear on the under side of the expanded upper portion or cap (*pileus*) a number of flat, knife-blade shaped parts (*gills*) which radiate like the spokes of a wheel from the handle or stalk (*stipe*) to the margin of the cap. Possession of these radiating gills marks a fungus as a member of the family Agaricaceae, these fungi being commonly called "agarics." Other closely related umbrella-shaped fungi outside this family lack gills. In the Boleti, for example, there may be seen on the under side of the umbrella, myriads of tiny pores which are the mouths of cylindrical tubes, while in members of the family Hydnaceae pendent spines occur instead. Still other related fungi lack the typical umbrella-shape, and show wide variation in form. The coral fungi (Clavariaceae) have the aspect of delicately coloured coral, and may be much branched like a deciduous tree. Others occurring on the sides of stumps, fallen logs, or trees are known as the bracket fungi and have the aspect of little shelves overlapping one above the other. The hundreds of species of all these various sorts of fungi possess, for the most part, a soft texture or flesh and the whole aggregation are commonly termed the "fleshy fungi." The application of the name mushroom to all of them accords with professional and popular usage for the most part. Some people use the term mushroom only for the edible members of this great group, and call those which are not edible toadstools. Although botanists recognize the word toadstool they regard it as synonymous with mushroom and write at times "edible toadstool" or "poisonous mushroom." In general they avoid the term toadstool.

The Agaricaceae, characterized as noted above, by the possession of gills on the under side of the pileus, embrace more than fifty different genera. These constitute five groups differing in the colour of the dust or powder which falls from the gills at maturity. This dust, composed of many thousands of tiny, unicellular spores, which float downward in such quantity as to form a noticeable deposit on the grass or earth beneath the fungus, may be easily caught for examination if a sheet of paper be placed directly beneath the cap. The colour of this spore dust in some genera is white. In others it is pink, purple-brown, rusty brown or black. The group characterized by possession of purple-brown spores contains about ten genera, one of which is Agaricus. The well known mushroom of commerce, *A. campestris,* is only one of a dozen or more species composing this genus. Some genera contain many dozens of species. In any given genus the species all possess in common certain prominent features of form, colour or structure which serve to distinguish them from those of other genera. Within a genus the species differ from one another in more minor characters of the same sort, it being necessary in many cases to take note of microscopic points of dissimilarity. Consideration of the genus Agaricus in this connection will serve to illustrate this situation concretely. All the species of the genus have purple to purple-brown spores, and the gills, which are white when young, change gradually through pink and successive shades of deepening brown as the spores reach maturity over their surface. The ends of the gills nearest the stipe are not attached to it and are not disturbed when the stipe is torn from the pileus. On the under side of the pileus of the young opening umbrella there is a chamois-skinlike membrane stretching from the stipe to the margin of the pileus and hiding the gills from view. A little later this membrane (*veil*) detaches itself from the margin of the pileus and falls to form a ring (*annulus*) around the stipe. In the other genera having purple-brown spores the gills are attached to the stipe and an annulus is lacking. The characters which serve for the identification of the genus Agaricus are thus seen to be few and readily recognized.

In the group of white-spored forms the genus Amanita is very important, because to it belong all the deadly poisonous mushrooms. Though a few of its species are regarded as edible, most of them are definitely dangerous, and some are capable of causing death. It is necessary, therefore, that the characters which separate this genus from others be clearly understood. As an annulus is present and as the gills are free from the stipe, there is a pronounced resemblance in form to Agaricus. However, the spore powder is white, and the gills are never brown. In most species they are white, and remain so even in old specimens. Though a young individual of Agaricus in which the gills are still white may be easily confused with one of Amanita, there is present in the latter an additional structure which, if not overlooked, will serve as a danger signal. While yet in the young more or less globose stage the plant in Amanita is completely enveloped in a definite sheath similar in character to the membrane which forms the annulus. This outer layer of enveloping tissue is called the *volva.* As the young plant grows and enlarges it bursts this membrane, emerges from it, elongates upward, and opens out into the umbrella shape. In some species of Amanita the entire volva persists thereafter at the base of the plant as a bag or cup surrounding the base of the stipe. This "death-cup" is not well formed in all cases, and even when present may be overlooked by careless individuals who fail to pick the entire plant including its base. Furthermore, in other species of the genus the rupture of the volva occurs equatorially in such a fashion that approximately the whole upper half of it remains attached over the upper surface of the pileus and is carried upward, the portion left at the base being insufficient to form a definite cup. In these cases the part carried up on the surface of the pileus is later broken up there into loosely adherent, flake-like scales by the expansion of the tissue beneath as the pileus opens into the umbrella form and increases in lateral diameter. The presence of such loosely attached, flake-like scales on the pileus should hold a fungus under suspicion until study of its other features proves it to be in fact not an Amanita. Though in many edible species in other genera scales occur on the pileus they are more firmly attached in character, and can be seen to have resulted from cracking or fraying of the tissue of the pileus itself. Specimens suspected of being Amanita should be examined carefully in the young state if possible, for the presence of the volva is then more readily noted. Questionable plants should be discarded.

There have been many well authenticated cases of illness and death from mushroom poisoning. In most of these instances poisonous species of Amanita were undoubtedly involved. However, records of symptoms of poisoning, and even death, exist in cases in which the plants consumed were apparently recognized as edible forms. Such cases have probably arisen from the eating of specimens already in a state of decay. Collectors should avoid all fungi which are not in a wholly fresh and wholesome condition. Old, wormy or semiputrid ones may well contain poisons similar to those present in rotting vegetables and meats. When poisoning by mushrooms is suspected it can not be too strongly urged that a competent physician be summoned with the least possible delay. The poisonous element is not the same in all species of Amanita. In *A. muscaria,* the fly agaric, it has been considered to be chiefly because of the alkaloid muscarine, but more recent work indicates that it may actually be one of the derivatives of muscarine. Symptoms of poisoning with muscarine usually appear in from one-half to two hours. Vomiting and diarrhoea, pronounced flow of saliva, suppression of the urine, dizziness, derangement of vision and loss of confidence in ability to make ordinary movements are succeeded by drowsiness, stupor, cold sweating and marked weakening of the heart's action. In fatal cases stupor persists for two or three days, and death follows the gradual weakening of the pulse. Treatment for this poison consists chiefly in the prompt removal of the unabsorbed mushroom material from the alimentary canal and the giving of subcutaneous injections of some powerful heart stimulant such as atropine. The poison phallin, present in *A. phalloides* and related species, is albuminous in nature and more deadly than muscarine. Preliminary symptoms of poisoning do not appear, unfortunately, until about ten hours after the mushrooms are eaten. Then severe abdominal pains are associated with cramps in the limbs and convulsions. Weakening of the pulse, vomiting, and extreme diarrhoea are followed by death in two to four days. The fundamental injury to the body is due to direct attack on and rapid dissolution of the blood corpuscles. The undigested mushroom material in the stomach and intestines should be removed as promptly as possible. Though it is usually stated that there is no known antidote for phallin, a report from the Pasteur Institute in Paris records preparation there of an antiphallinic serum which has proved so effective that the French Government requires a supply of it to be kept available for use by physicians.

In picking wild mushrooms for the table it is necessary to avoid not only the extremely poisonous Amanitas, but also the more or less poisonous and distasteful species of other genera. Such forms exist in genera whose other members are in all respects wholesome. Consequently, it is necessary to know the specific identity of every plant eaten. There is no royal road to this knowledge. Careful observation of the details in which one species differs from another, combined with the study of pictures and descriptions in some standard book on mushrooms will enable the amateur student to recognize with certainty at least a few desirable forms. All others should be avoided. One species often differs from another in various minor features of form or colour, and only critical observation will enable the collector to recognize a given species with certainty and assure him that it is not a somewhat similar, perhaps poisonous one.

The tiny spores which fall in countless thousands from the gills of mushrooms, float about in the air currents and are disseminated over a wide area. They are analogous to the seeds of higher plants and function in propagating the species. Each spore is a microscopic, more or less globose or ovoidal, cell, composed of a bit of protoplasm surrounded by a thin wall. Though capable of remaining quiescent for a time, it finally undergoes renewed growth, and if it finds adequate moisture and food in the spot where it has fallen it germinates. The side of the spore bulges outward and forms a cylindrical tube-like outgrowth which gradually lengthens and develops into a system of branching threads. These permeate the elements of the substratum, and are readily visible to the unaided eye as a network of delicate strands, usually white, though in some species of other colours. Strands arising from different spores may merge, and threads as heavy as ordinary twine may result. The tips of these heavy cords at the surface of the substratum in time enlarge into more or less globose bodies, commonly termed buttons. Each button is in fact a young mushroom, and by increase in size and internal differentiation of tissues, the umbrella-like mature plant gradually comes into being. It will be understood then that this umbrella is not the whole plant but merely the above ground fruiting portion of it. The mycelium below ground is the vegetative or feeding portion. In some wild species it occurs in the soil, in others in leaf mould, in rotting wood, or in any other material from which the fungus may obtain its food. The mushroom of commerce, *Agaricus campestris,* is grown in beds of specially prepared manure to which soil, straw, or other materials are sometimes added. In this mixture the mycelium grows luxuriantly. The grower calls manure in which the mycelium is abundantly present *spawn.* Old spawn is mixed into the manure in the preparation of new beds, and flakes of spawn or bricks of it are sold. Horse manure has been preferred to other sorts, and the coming of the automobile era has reduced the amount available while increasing its price. Efforts have been made to make use of other materials. Research has shown that the application of urea to mixtures of straw and other composting elements gives satisfactory results. Much more investigation is desirable.

Not uncommonly, commercial mushroom beds are invaded by the mycelium of other species of fungi. In these cases the reduction in the crop necessitates the removal of the infested material, sterilization of the beds, and the use of new spawn.

Like all widely spread and much-cultivated plants, the mushroom of commerce has developed a number of recognized varie-

MUSHROOMS

Thousands of kinds of mushrooms grow widely throughout the world. While many are highly prized table delicacies, others, comparatively few in number, are deadly poisonous. At certain stages in their growth—*See* the article Mushroom—the most dangerous kinds closely resemble some of the finest edible forms, so that in the selection of wild mushrooms for food extreme care is absolutely necessary

1. Chanterelle (*Cantharellus cibarius*), edible. 2. Barometer Earth Star (*Geaster hygrometricus*), edible. 3. Warty Puffball (*Scleroderma vulgare*). 4. Pine Flammula (*Flammula sapinea*). 5. Bitter Boletus (*Boletus felleus*). 6. Jack-my-lantern (*Clitocybe illudens*), luminescent, poisonous. 7. Net-bearing Dictyophora (*Dictyophora duplicata*). 8. Stink Horn (*Ithyphallus impudicus*), offensive. 9. Honey Agaric (*Armillaria mellea*), edible. 10. Coral Milky Cap (*Lactarius torminosus*). 11. Pungent Russula (*Russula emetica*), poisonous. 12. Peppery Milky Cap (*Lactarius piperatus*). 13. Fly Agaric (*Amanita muscaria*), deadly poisonous. 14. Reddish Agaric (*Amanita rubescens*). 15. Death Angel (*Amanita phalloides*), deadly poisonous. 16. Yellow Amanita (*Amanita velatipes*)

ties, and in different regions and under different modes of culture it shows differences as do the various garden plants. There is always the desire to obtain even more attractive or productive varieties. Toward this end research work in various laboratories has been carried on, and pure cultures obtained from single germinating spores have been prepared and tested. Such pure cultures are in some cases maintained under laboratory conditions and made available to the grower on request.

Mushrooms are grown in caves, in abandoned coal mines, in dark cellars, and in specially built mushroom houses. They are not allowed to reach the fully expanded condition, but are harvested in the large button stage while still very firm, and before the discolouring spore dust begins to fall from the gills. They are usually packed neatly in attractive containers. Though they are being grown in increasingly large quantities, they are still expensive and constitute a delicacy rather than a staple article of food. Though nutritious, their food value is not as great as their extremely high protein content would indicate. *See* FUNGI; MOREL; PUFF-BALL; TRUFFLE.

MUSHROOMS, COOKERY OF. Edible mushrooms contain some nitrogenous food and about 90% water. Eaten with other foods they are of great service in the diet on account of their flavouring properties. It is dangerous to eat mushrooms which have been gathered by anyone who has not studied the different kinds.

Among the most familiar kinds are the common meadow mushroom (*Agaricus campestris*); button (immature) mushrooms employed chiefly for garnishing purposes and as an addition in high-class dishes; and truffles (underground fungi).

To prepare ordinary mushrooms for cooking, pick over and wipe with a flannel dipped in salt. Peel and remove stalks where necessary. The latter may be used for flavouring stews, soups, sauces, etc.

Mushrooms may be grilled (broiled) and served with maître d'hôtel or plain butter, etc.; baked in the oven under glass (or in a shallow dish); stewed in a casserole with other foods, *e.g.*, Italian pastes, rice, or in a well-flavoured sauce; or, they may be used in stuffings for turkey, poultry and game; they are also employed for garnishes in making galantines, etc.

Stewed Mushrooms.—Place the mushrooms in a stewpan with 2 oz. of butter, salt, a squeeze of lemon juice and a blade of mace. When cooked, stir in a white liaison of flour and butter blended together. Stir well and serve either as an entrée, or on toast as a savoury. This dish may be varied by adding other ingredients and may be served as a cream by adding a sauce of cream and beaten-up eggs.

Fried Mushrooms.—These are frequently added as an addition to a mixed grill. Frying should be done in a frying pan and not in a deep pan of fat. It is best to use good margarine or butter.

Grilled Mushrooms.—Large mushrooms should be chosen for grilling. Grease the gridiron before cooking. Place flesh side uppermost on the gridiron.

Stuffed Mushrooms.—Good-sized mushrooms are needed for stuffing. Any well-flavoured forcemeat can be used though certain flavours blend better with mushrooms than others, *e.g.*, game. To stuff, remove the stalks and pile the forcemeat in the centre of each mushroom. Squeeze lemon juice over and cover with buttered paper or place under glass. Bake in the oven for half an hour.

Mushroom Ketchup.—Sprinkle salt freely over large meadow mushrooms and leave them to stand for a few hours, then mash them in a mortar and set aside for 48 hours. Stir from time to time. Press through a colander and place in a pan. Boil up, skim carefully and simmer for an hour. Strain into a pan and leave until the next day. Then strain again leaving the sediment at the bottom of the basin and add one ounce of black peppercorns, a blade of mace, half an ounce of allspice, one quarter of an ounce of ginger and half an eggspoonful of grated lemon rind to each quart of liquor. Boil up and reduce to half the quantity Bottle and store in a dry place.

MUSIC. The Greek μουσική (*sc.* τέχνη) from which this word is derived was used comprehensively for all the arts of the Nine Muses. Contrasted with γυμναστική (gymnastic) it included the culture of the mind as distinguished from that of the body. Thus the singing and setting of lyric poetry formed but a small, if a central, part of a "musical" education which ranged from reading and writing to the sciences of mathematics and astronomy besides all the arts of literature. The philosophers valued music both in the ancient general sense and in our restricted sense, chiefly as an educational element in the formation of character; so that we obtain little light from them on the pure aesthetics of the Greek art of musical sounds.

1. INTRODUCTION

The present article deals mainly with the musical art-forms matured by European civilization since the 14th century. More ancient music is discussed frankly as beyond our power of appreciation except in the light of prehistoric origins. Our Western art of music stands in the unique position that its language has been wholly created by art.

Music owes but little to nature in the form of acoustic science, and still less to the sounds that occur outside works of art. It is already a mature musical art that selects the acoustic facts, just as in painting it is art that determines the selection of optical facts. Wise critics have, since Ruskin's day, abandoned the attempt to settle *a priori* how much of nature an aesthetic system ought to digest; and music differs only in degree from literature and the plastic arts as to independence of nature.

Yet the difference is often important. Perspective existed as a science before it was taken up by painters, and as a human experience before it became a science. The naïve Western spectator has seen enough of it in pictures to make him resent its neglect, whether in modern art or in the masterpieces of China and Japan. In music the nearest analogy to perspective is the system of tonality developed by the great composers from Alessandro Scarlatti to Wagner. (*See* HARMONY.) Every step in its evolution has been fiercely contested; and even twenty years after the end of Wagner's long career not every responsible musician was ready to admit Wagnerian tonality as a legitimate enlargement of the classical system.

If we set aside language and the organized art of music, the power of distinguishing sensations of sound is no more complex than the power of distinguishing colours. On the other hand sound is the principal medium by which most of the higher animals both express and excite emotion; and hence, though until codified into human speech it does not give any raw material for elaborate human art, it suffices for bird-songs that are as long prior to language as the brilliant colours of skins, feathers and flowers are prior to painting. Again, sound as a warning or a menace is an important means of self-preservation; and it is produced instantly and instinctively.

All this makes musical expression a pre-human phenomenon in the history of life, but is unfavourable to the early development of musical art. Primitive music could mysteriously re-awaken instincts more elemental than any that could ever have been appealed to by the deliberate process of drawing on a flat surface a series of lines calculated to remind the eye of the appearance of solid objects in space. But the powers of music remained magical and unintelligible even in the hands of the supreme artists of classical Greece. We may be perfectly sure that if the Greeks had produced a music equivalent to the art of Palestrina, Bach or Beethoven, no difficulty of deciphering would have long prevented us from recovering as much of it as we have recovered of Greek literature. Some enthusiasts for Oriental lore assure us that long ago the Chinese knew all about our harmonic system but abandoned it after they had exhausted it. This need not worry us. The Oriental aristocrat conceals in his politeness a profound contempt for our efforts to patronise his culture; and that contempt is justified when we show such ignorance of our own music as to suppose that a music of similar calibre could have utterly

disappeared from a living nation whose most ancient plastic art and literature commands our respect and rewards our study. When we trace the slow and difficult evolution of our harmonic system we cease to wonder that it was not evolved sooner and elsewhere, and we learn to revere the miracle that it was evolved at all.

2. NON-HARMONIC AND GREEK MUSIC

Music before the rise of a harmonic system is of two kinds, the unwritten or extemporaneous, and the recorded or scientific. At the present day the music of races that have not acquired Western harmony often pleases us best when it seems most extemporaneous. Tradition can go far to fix the forms and even the details of a performance that may, without the aid of words or dance, last for hours. With words or dance, music becomes more capable of being fixed by writing; but the first musical problems are as far beyond conscious reasoning as the origins of language. Birds solved them before human beings; and folk-music can show real beauty when the systematic music of its day is arbitrary and uncouth. Moreover, folk-music, together with the present music of barbarous races and Oriental civilization, can give us materials such as anthropology uses in reconstructing the past from its vestiges in the present.

For us the music of ancient Greece is by far the most important branch of musical archaeology. Unfortunately the approach to this most difficult subject has been blocked by lack of co-ordination between scholarship and musicianship; and the ascertained truth is less instructive to the general reader than the history of opinions about it. These opinions begin to be interesting when they are expressed by musicians whose music we can understand. The natural tendency of such musicians was to suppose that Greek music was like their own; and each advance in knowledge is marked by disillusion. The first difficulty presented by ancient Greek writers was sufficiently disconcerting. The Greek terms for "high" and "low" were found to be reversed. Our own meaning seems founded in nature; and science confirms it. Our "high" or "acute" notes demand tense vocal cords and correspond to vibrations of "high" frequency. A great 16th century composer, Costanzo Porta, inferred a mystery here, and argued that the Greeks had mastered the art of a totally invertible polyphony, such as Bach afterwards displayed in two fugues in *Die Kunst der Fuge.* Porta accordingly wrote a 4-part motet (*Vobis datum est cognoscere mysterium*) which could be sung upside down: and his contemporary Vincentino composed 4-part motets in each of the three Greek *genera,* diatonic, chromatic and enharmonic. (*See* Hawkins's *History of Music,* i. 112, *seq.*) They are as good as any other music written on *a priori* principles, and the enharmonic motet may be commended to some of our modern experimenters in quarter-tones. But they represent as much knowledge of Greek music as we possess of the inhabitants of Mars.

The truth must be sought by other methods and by far the most promising is the study and comparison of the present scale of nations, whether barbarous or cultured, who have not come into contact with the classical harmony of the West.

A readable account of musical origins may be found in Parry's *Evolution of the Art of Music.* Following the researches of A. J. Hipkins and A. J. Ellis, Parry illustrates the fact that most of the primitive scales, notably the pentatonic scales prominent in Scottish and Chinese music, are built around the interval of a downward 4th (as from C to G) which was probably the first melodic interval to become fixed in the human mind as being simple enough but not too wide. A scale would begin to form by the accretion of other notes near the bottom of this interval. Now take another 4th with similar accretions below the former, either conjunctly (as G to D below the C–G) or disjunctly (as F–C). The resulting scale will either fill or include an octave, it does not matter which; for the filled octave of the conjunct tetrachord contains in another position the notes of the included octave of the disjunct tetrachords, as can be seen in the combined series C, A, F, G, E, D, C, A, G. And the octave was recognized from the outset as a limit after which a musical series repeats itself.

The Greeks had three *genera* of scale: the diatonic, the chromatic and the enharmonic. Of these the diatonic divides the tetrachord most evenly, as E, D, C, B:A, G, F, E. This gives us our diatonic scale in what Palestrina would call the Phrygian mode. The Greeks found that all its notes could be traversed (as a knight's move can traverse our chessboard) in a series of intervals which they called concords. (They thought of them only as successions, not combinations of sound.) These were the 4th (in the ratio 4:3); the 5th (3:2); and the octave (2:1). (Our own "perfect concords" are in these ratios.) Scales with chromatic tetrachords (E, C♯, C♮, B:A, F♯, F♮, E) could also be traversed by the concordant intervals, but not so easily. The enharmonic tetrachords, which only the most accomplished singers could sing, were beyond the reach of perfect concords; and for us they would need a special notation, as E, C, B′, B ; A, F, E′, E♮; where B′ and E′ signify something like quarter-tones above the B♮ and E♮. Yet this difficult scale was said to be the oldest of all; which seems not unlikely when we observe that it gathers three notes closely to the bottom of the tetrachord, leaving a gap of a major 3rd from the top. Eliminate the quarter-tones, and there remains a pentatonic scale E, C, B:A, F, E, which is more likely to be the earliest filling out of the downward 4th than the scales in which the auxiliary note is a whole tone away. And if this nucleus had the prestige of a mystic antiquity musicians would feel a pious pride in mastering the difficulty of filling it up like the other genera.

If authorities on Greek music would abandon their habit of writing scales and reckoning intervals upwards, their results, whether correct or not, would become much more lucid. For, as Parry points out, it is only our harmonic system which makes us think of scales as normally rising; and when a musician applies the term "cadence" to chords that rise from dominant to tonic he contradicts the literal meaning of the word.

Until the most recent times classical scholars have ruthlessly closed the door upon all hope of further light from the comparison of Greek data with the phenomena of extant non-harmonic folk-song and Oriental scales. If such a comparison is to have any meaning we must assume that the now universal phenomena of modes existed in ancient Greece. Modes, as far as non-harmonic melody is concerned, are various cross-sections of a standard scale. Thus, Scottish music shows very clearly five pentatonic modes. Adding the 8ve to complete the scale, these are, 1. C, A, G, F, D, C; 2. D, C, A, G, F, D; 3. F, D, C, A, G, F; 4. G, F, D, C, A, G; 5. A, G, F, D, C, A. In the article HARMONY the ecclesiastical modes of pure polyphony are given with their fondly-imagined Greek names. Pre-harmonic music without modes is contrary not only to our Western prejudices but to the whole trend of anthropological research. In these circumstances classical scholars, under the guidance of D. B. Monro, crushed all hopes by deciding that the Greeks had no modes at all, but that either their ʽαρμονίαι or their τονόι (the terms, whatever they mean, are not synonymous) were mere transpositions of the three genera into various pitches, just as our "keys" are transpositions of our pair of major and minor modes.

When Monro published his *Modes of Ancient Greek Music* in 1894, musicians had learnt too well the lesson that Greek music must not be expected to make sense. They would never dispute a point of classical scholarship; and it did not occur to them that Monro might be just so innocently familiar with modern music as not to realize that he might as well impute high-church tendencies to Alcibiades because of "the splendour of his liturgies" as impute to the ancient Greeks a system of keys related by mere transposition. But musicians only thought that even the most unprejudiced anthropological comparison of extant scales could prevail no more than Macfarren's Victorian assumptions could do in a dispute with Monro. Fortunately in 1916 Mr. G. H. Mountford, in a degree thesis, satisfied classical scholars that Monro was in error and that the Greek modes were modes in the universal and proper sense of the term.

Miss Kathleen Schlesinger has found, by experiments with a monochord, a means of producing modes on mathematical principles. Certainly the Greeks did measure musical intervals mathe-

matically on a string; certainly Miss Schlesinger's system is among the very first things that could have happened in that way; and its results produce many phenomena that ought to have occurred in ancient Greek music. There is, for instance, a remarkable passage in Plato's *Republic* (VII., 531) where Socrates gibes at the pedantries of the merely practical musicians who spend hours in arguing whether this and that note are too near to allow another note between them. And Miss Schlesinger's various scales comprise between them notes quite close enough to explain how the practical musician could get into difficulties about what was obvious to the philosopher. Miss Schlesinger has, moreover, tuned a pianoforte on the basis of her theory, and the result is acoustically very interesting. So much then, for *a priori* theory and practical experience. If Miss Schlesinger's results are not Greek they ought to have been.

The other line of approach is through the experience of setting the choruses of Greek tragedy to a modern music which confines itself to a strict representation of the metre and sets strophe and antistrophe to the same melody. The composer should not attempt Greek modes, on whatever theory, or he will achieve nothing better than an effect of singing "We won't go home till morning" on the supertonic of a minor key and with a beat missing. Instead of thus warping his imagination the composer should translate all that modern culture enjoys in Greek poetry into a music that he can enjoy; restricting himself mainly to one note to a syllable and, while making his instrumental accompaniment as beautiful as he likes, straying into no by-paths of musical tone-painting other than the most natural symbolisms. The Greek rhythmic forms prove musically fascinating, and there is full scope for fine melody within them. The strict correspondence of strophe and antistrophe causes difficulties which reveal much. Even a unisonous accompaniment, such as the Greeks had, can glide over a difference of punctuation or indeed a running on of the sense between strophe and antistrophe, as at the end of the enormous first chorus of *Agamemnon;* and the technique of such compromises closely resembles that of Schubert and Brahms in strophic songs, and has the subtlety of Greek simplicity. Aristophanes, in the *Frogs,* laughs at the interlinear *θραττο θραττο θρατт* (or "plunketyplunk") of the Aeschylean lyre. The passage seems to indicate something more extensive than a merely connective tissue; but exaggeration is not unknown in comedy.

More difficult and therefore still more instructive are the occasional contrasts of sentiment between strophe and antistrophe. In another chorus in *Agamemnon* the pretty ways of a lion-cub are to be sung to the same music as the tale of disaster that befell the man who adopted it when, on growing up, it behaved as might be expected. The highest point of pathos in the first chorus, one of the supreme things in poetry, is the moment where the description of the sacrifice of Iphigeneia turns into a reminiscence of her singing in her father's halls and then runs on into the antistrophe, with the words "The rest I saw not, nor will I tell." After which the same music has to express the pious hope that the queen who now approaches shares the wishes of the chorus for the welfare of the land she holds in trust.

From Plato we learn that musicians degraded themselves by imitating the roaring of lions and the whistling of winds. But what was the Greek criterion for the singing voice? Certainly very different from ours; for Aristotle says that certain high-pitched modes (but what is "high" in this context?) are suited to the voices of old men. An age-limit is the only criterion the heartless modern critic has for the voices of old men. Be this as it may, the safest inference from it is that every educated Greek was expected to sing well as an integral part of the art of speaking well. Perhaps our modern contrast between the singing and the speaking voice did not exist. Nowadays it is not uncommon to find a high soprano speaking normally around the A or G below the treble staff.

(*See* also Aristoxenus; Euclid; Pythagoras.)

3. HARMONIC ORIGINS

The latent harmonic sense of the Greeks is shown in the fact that their diatonic scale was amenable to the Pythagorean science of harmonic ratios. And we cannot suppose that no notice was taken of the combined sounds resulting from reverberation in halls and caverns, or from striking several strings of the lyre at once. Yet the fact remains that outside the orbit of our own Western music of the last six centuries we know of no harmonic system that has advanced beyond drones below the melody and cymbals (our Authorized Version is right in reading "tinkling cymbal") or bells above it.

Music, as we now understand it, consists in the interaction of three elements as inseparable (but not as interchangeable) as the three dimensions of Newtonian space. The Greeks knew two, rhythm and melody, which are as ancient as human consciousness and evidently have their meaning for some other animals. But non-harmonic melody is a very different thing from melody that implies harmony. (*See* Melody exs. 1 and 2 with their discussion.) When we hear an unaccompanied folk-song we involuntarily think of it as the top line of a series of harmonies. If it is really pre-harmonic it will prove unamenable to that interpretation, and then we shall think it quaint. Neither the quaintness nor the harmonic interpretation ever entered into its intention. Life is too short for Western musicians to devote much of it to the violent mental gymnastics of thinking away the harmonic ideas that have made Western music enjoyable throughout five centuries. We may perhaps widen our experience by going back another two centuries; for it was agreed by all the musicians in Vienna that a concert of "Gothic" music was their most interesting musical experience of the year 1928.

In the article Harmony the main steps are indicated by which mediaeval musicians advanced from doubling melodies in 4ths and 5ths (as the unoccidentalised Japanese are said to be doing now) to an aesthetic system of polyphony that demands complete independence in its melodic threads and forbids consecutive 5ths and 8ves as barbarous. The details of this evolution are abstruse; but two main issues may be mentioned here. Polyphony could not have been established without fixed scales and a repository of known melody for composers to work upon.

The scale was set in order in Graeco-Roman times by Ptolemy the astronomer, who flourished A.D. 130 and from whose time the history of the "ecclesiastical modes" becomes continuously traceable until the records of music are secured by the art of printing.

The necessary repository of melody was supplied by the ancient plain-songs of the church, many of which claimed to have come uncorrupted from the music of Solomon's temple and certainly had a continuous history reaching back to early Christian services in the catacombs of Rome. In A.D. 384 a large body of these "tones" was set in order by St. Ambrose. According to a tradition accepted, after some "historic doubts," by good authorities, St. Gregory revised and enlarged the Ambrosian collection; and the whole corpus of Gregorian music undoubtedly familiarizes Roman Catholics of to-day with a music enormously more ancient in its origin than any harmony. This music forms the principal melodic foundation of Palestrina's polyphony; but by his time it had become corrupted, and we must look to the Solesmes edition of 1904 for the text and method of singing plain-song in the perfection it is held to have attained shortly after the death of St. Gregory. The essential difference between the Ratisbon tradition (which we may loosely call Palestrinian) and that of Solesmes is that the Palestrinians impatiently curtailed the flourishes of the plain-song much as Palestrina did with the Gregorian themes he used in polyphony; whereas the Solesmes method restores the free speech-rhythm which makes the flourishes (or melismata) possible in a rapid delivery. Some of these melismata are very extensive, and the Palestrinians (who gradually developed the modern organist's habit of providing each note of a Gregorian melody with a separate chord) had some excuse for mistaking them for corruptions of style.

The Gregorian tradition did not stand alone. There was an ancient Visigoth (or "Spanish") tradition; and there are the traditions of the Eastern Church. Professor J. J. W. Tillyard has shed much light on Byzantine music (*q.v.*), including a promising opening in the deciphering of the earliest *Neumae,* diacritical signs above the words, supposed to indicate musical notes.

He uses the method of interpreting the past from vestiges of primitive usage in the present. Controversies as to the number of modes, whether 8 or 12, raged till late in the 16th century. The *Dodecachordon* of Glareanus settled the question in favour of twelve, as its name implies. Meanwhile composers developed polyphony by ear and got no help whatever from the theorist. Quite independent of modes and entirely practical was the hexachord scheme (*see* HEXACHORD) developed in the 11th century by Guido of Arezzo (*q.v.*).

The general reader may learn something of the hexachord system very pleasantly from the music-lesson in *The Taming of the Shrew.* Hortensio's gamut says "Gamut am I, the ground of all accord . . . D sol re, one clef [*i.e.,* sign, or key], two notes have I: E la mi: show pity or I die." "Gamut" is a survival of Greek tradition; for the bottom note of the Greek scale was identified with the bass G, and this "ground of all accord" is an octave below the Ut of the hard hexachord. Hence it is Gammaut. D is Sol in the hard hexachord $\left\{\begin{matrix} G, & A, & B, & C, & D, & E \\ Ut & Re & Mi & Fa & Sol & La \end{matrix}\right\}$ and Re in the natural hexachord $\left\{\begin{matrix} C, & D, & E, & F, & G, & A \\ Ut & Re & Mi & Fa & Sol & La \end{matrix}\right\}$. It has two names but only one position or "clef," unlike B which has to be flattened in the soft hexachord (F to D). (Morley writing in 1597, calls A flat the B clef.) E is La in the hard hexachord and Mi in the natural hexachord.

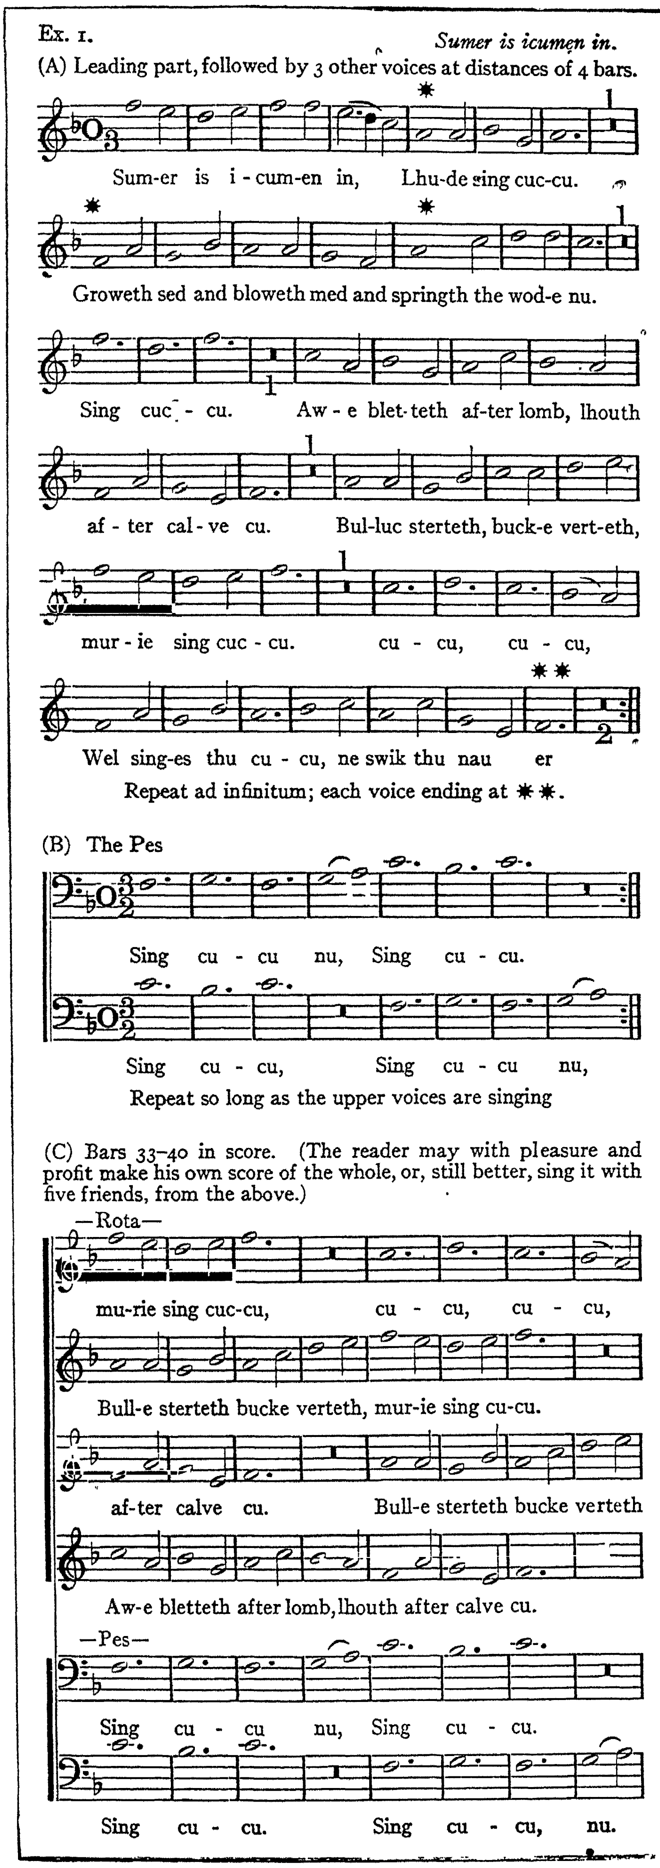
Between Fa of the natural hexachord and Mi of the hard hexachord a dissonant tritone 4th exists. It gave great trouble to mediaeval musicians, who assigned it to the devil. *Mi contra Fa est Diabolus in Musica.*

To the early harmonic and contrapuntal processes alluded to in the article HARMONY some details must be added. The famous unwritten songs of the aristocratic troubadours or *trouvères* of the 12th and 13th centuries undoubtedly set the fashion in melody, and probably set it in the direction of *Sumer is icumen in;* that is to say, in the Ionian mode (that *modus lascivus* that is identical with our major scale) and in a lilting trochaic rhythm

Sumer is icumen in contains no technical feature that has not been found in other compositions of its period, but nothing within two centuries of it achieves either its euphony or its easy handling of canon in four parts on a canonic bass in two. Its consecutive 5ths which sound licentious to us were in its own day the sole justification of the scheme.

It confirms other evidence that the imperfect concords (3rds and 6ths) must have obtained squatter's right in music in spite of theorists; for a very early practice known as ghimel or gymel consisted in singing in 3rds. This is not merely doubling, for the 3rd must oscillate between major and minor according to its position in the scale; and this adjustment requires an advanced harmonic system. When scholars tell us that singing in 3rds was traditional in Britain before the Roman Conquest, we must demur, especially when they tell us (in *Grove's Dictionary of Music and Musicians,* 3rd edition) that we must not expect to find written records of "so simple a process." Similarly we must not expect to find ancient Greek written records of so simple a process as steam locomotion. Still, let us not be unduly sceptical as to the extent to which popular licence and unrecorded extemporisation could advance beyond all the theoretic lore that scribes will record.

The troubadours disdained both the practice of accompaniment (which they left to their servants) and the art of scientific or written music. Not until the time and work of Adam de la Hale, surnamed the Hunchback of Arras (*c.* 1230–1288) can we trace the development of the troubadour into the learned musician. Nearly a century later, when literature is unbending from its universal Latin and becoming truly universal by becoming vernacular, we find the poet Machault, who stands with Petrarca among Chaucer's masters in the technique of verse, producing music that marks a technical advance discoverable by grim toil of expert analysis. But so far we may pardonably dismiss all such



archaic work (except *Sumer is icumen in*) with Burney's sly comment on the earliest piece of recorded music known to him: "It is not of such excellence as to make us greatly regret the loss of such music; though the disposition of those who were pleased by it may have been a great blessing to them." When music is too archaic or inaccessible to give us aesthetic data more may be learned from the disposition of those who were pleased by it than from its recorded technical data.

Before the middle of the 15th century music had passed forever out of the stage at which anything need be known about a composer other than his music. As early as 1437 an Englishman, John Dunstable, had acquired a European reputation. The golden age of the 16th century had no use for archaic music, and Morley in his *Plaine and Easie Introduction to Practickall Musicke* quotes Dunstable much as we might now quote Bach if all Bach's works were lost except for traces of contemporary hostile criticisms and awe-inspired laudations. To call Dunstable the "inventor of counterpoint" is no better than to call Cadmus the inventor of the alphabet. But he is the earliest composer whose polyphony is in direct line with that of the golden age; for Dufay, the first important master of the Netherlands, where the true polyphonic tradition was for long thought to have originated, is known to have died in 1474, 21 years after Dunstable. And when Walker, in his *History of English Music*, praises a motet by Dunstable for its distinction of style, he is describing permanently intelligible aesthetic values. By the end of the 15th century counterpoint was substantially fixed. Practice was still imperfect and aims were uncertain, but skill was increasing, and in the 16th century we leave archaic music behind.

4. THE GOLDEN AGE

From this point onward the history of music is best studied in the masterpieces of the art. Each period has its own art forms. Articles relevant to the golden age are CONTRAPUNTAL FORMS; COUNTERPOINT; HARMONY: *Modal Tonality;* INSTRUMENTATION; MADRIGAL; MASS; MOTET; with biographies on AICHINGER, GREGOR; ALLEGRI, GREGORIO; ANERIO, FELICE; ANIMUCCIA, GIOVANNI; ARCADELT, JACOB; BATESON, THOMAS; BENNET, JOHN; BULL, JOHN; BYRD, WILLIAM; DES PRÉS, JOSQUIN; ECCARD, JOHANN; FARRANT, RICHARD; FESTA, CONSTANZO; GABRIELI; GIBBONS, ORLANDO; GUERRERO, FRANCISCO; HANDL, JACOB; HASLER, HANS; ISAAC, HEINRICH; LASSO (LASSUS), ORLANDO; MARENZIO, LUCA; MORLEY, THOMAS; OBRECHT, JACOB; OKEGHEM, JOANNES; PALESTRINA, GIOVANNI PIERLUIGI DA; SWEELINCK, JAN PIETER; TALLIS, THOMAS; TAVERNER, JOHN; VICTORIA, TOMMASSO LUDOVICO DA; WEELKES, THOMAS; WILBYE, JOHN.

The external history of music is not so easily brought into true relation with the art as popular legends would have it. Everybody is familiar with the story of the drying up of polyphony in the foolish ingenuities of Flemish contrapuntists until, at the behest of the Council of Trent, Palestrina wrote the *Missa Papae Marcelli* in a pure and simple style which convinced the authorities that polyphonic music could be devout. Undoubtedly there was a great deal of barren ingenuity in the work of the lesser Flemish masters, and Obrecht himself had written masses in which the liturgical text is drowned beneath five other texts which each voice sings to other plain chants and themes of old songs. The secular tunes thus freely introduced were not always sung as *canti fermi* too slow to be recognized. Recognition sometimes even led to the singing of the original words. One old song, *L'homme armé*, became the string round which every possible ingenuity crystallized in the composition of the Mass. There is no reason to doubt that the state of church music both deserved and received the serious attention of the Council of Trent.

On the other hand, not all Flemish music was silly, and many of the quaintest "canonic" devices were really nothing but harmless cryptography applied to music that was composed on purely artistic lines. Burney discovered this when, with his usual flair for good illustrations, he quoted some dry ingenuities from Okeghem (or Okenheim) and followed them by the wonderful *Deploration de Jehan Okenheim* by that master's great pupil Josquin des Prés, who is the first unmistakably great composer and who has been well named "the Chaucer of music." No listener can fail to recognize, from anything like a competent performance, the spontaneous beauty and poetic depth of this music, throughout which, while the other voices sing an elegy in French, the tenor intones in Latin the plain chant of the Requiem beginning on a note a semitone lower than the liturgical pitch, and continuing in the wailing melodic mode thus produced. Burney had the wit to see that the "canon" *ung demiton plus bas* did not mean that some other part was to answer the tenor in canon, but was merely the "rule" for reading the cryptogram, the tenor being written at the normal pitch.

Many Flemish devices are well calculated to give coherence or climax to a large composition. One voice may wander up and down the scale with a single figure and a single motto text while the other voices tell their whole story in polyphony. For instance, declaim the words *Miserere mei Deus* in monotone rising one step just for the first syllable of *Deus*. Start on the fundamental note of the scale, and at intervals repeat the phrase a step higher each time. After reaching the fifth degree go down again. Josquin's *Miserere* is a setting of the whole 51st Psalm, woven round a tenor part entitled *Vagans* and constructed on this plan. It is one of the first mature masterpieces in the history of music. Palestrina's art is too subtle for rigid Flemish devices; but once, in one of his finest motets, *Tribularer si nescirem*, he uses Josquin's *Miserere* burden in exactly Josquin's way. Lasso is thoroughly Flemish in both sacred and secular music, and in a motet on the resurrection of Lazarus he makes a soprano *Vagans* cry *Lazare, veni foras* from the beginning of the narrative until the chorus reaches these words and joins in with them in triumphant polyphony.

One must not, then, be misled by the ecclesiastical tradition that condemns Flemish music wholesale. In any case the concern of the church authorities was liturgical rather than artistic. The bishops would have been for the most part glad enough to see church music restricted to the note-against-note style of Palestrina's litanies, *Stabat Mater, Improperia* and last book of *Lamentations*. A very sublime style it is, and Tallis's responses, in their authentic form, are a noble illustration of it. But, as Jeppesen (*The Style of Palestrina and the Dissonance*) has clearly shown, Palestrina's *Missa Papae Marcelli* shows special signs of being a deliberate demonstration that a high degree of polyphony can be reconciled with clear choral delivery of the words. Certainly the ecclesiastical authorities did not long succeed in preventing the use of secular themes in church music.

Many great musicians of today have a musical culture which ignores the golden age; and a knowledge of Palestrina is still considered, as it was in the days of Bach and of Beethoven, rather an out-of-the-way specialty. This is like a culture based on Latin and sceptical of Greek; good as far as it goes, but limited and cocksure like an 18th-century gentleman's artistic impressions of the grand tour. An illustration of the most perfect style of the golden age is appended to the article MOTET.

5. THE MONODIC REVOLUTION AND ITS RESULTS

Until Palestrina's art attained its height, the path of progress in music for the best part of two centuries was that of purity. It was not the free and bold spirits but the idlers and dullards who broke rules and disliked contrapuntal forms. The Hispano-Roman style of Victoria and Palestrina was not everything. It was not secular (though Palestrina's madrigals make him as supreme in that form as in church music), and it was not, like the glorious English polyphony, experimental or racy of the soil. But it was metropolitan, and the boldest of the Tudor composers would have been no such fool as not to hold it supreme. But even before the death of Palestrina a new music was groping toward the light; the path of progress for this music was no more that of purity than the path of omelette making is that of the conservation of eggshells.

Eve's apple was not more fatal to man's earthly paradise than the rise of instrumental music and dramatic solo declamation was to the hope of continuing the golden age of music into the 17th century. The revolution did not consist in this detail or that. To

Ex. 2. *La Déploration de Jehan Okenheim,* for soprano, male alto, two tenors and bass
(Barred according to the main rhythms.)
Phrygian mode transposed.
by Josquin des Prés

*Or "de trépas."

*The distribution of the words is uncertain. Perhaps these repeated notes are a realistic sob.

say that Monteverdi "invented" the dominant 7th, or that anyone else invented it, or that any such invention could revolutionize music, is like saying that Shakespeare revolutionized drama by inventing strange oaths. The important point is not the technical names of the details but their meaning. When Lasso was young some experiments in chromatic music had been made by Cipriano de Rore, and were eagerly imitated by Lasso. But what is Lasso's object in being the first person to write such an out-of-the-way note as A♯? Simply to express the words "*novum melos.*" Very different from such intellectual playthings is the purpose of the powerful discords of Monteverdi's madrigal *Cruda Amarilli* and of the monodic lament of Ariadne which drew tears from the spectators of his opera *Arianna.*

The article MONTEVERDI contains further remarks on his importance and on his coincidence in place and time with the creators of the violin. (*See* also OPERA.) The Palestrina style henceforth became the rightful privilege only of those composers who, either having mastered it before monody arose, or, like Orlando Gibbons (1583–1625), living in regions too remote for it to penetrate, could still compose polyphonically from impulse and not from asceticism. Orlando Gibbons did, in fact, try some monodic experiments which are poor enough.

An impulsively eclectic composer is another matter; and in uncouth, illogical Germany a giant such as Schütz could almost fill the century before the birth of Bach and Handel, with a life's work ranging from the pure polyphony of his Venetian master Gabrieli to the exploitation of all his "astute friend" (*scharfsinniger Freund*) Monteverdi's new principles in most gigantic efforts in mixed vocal and instrumental polyphony. From Schütz we can extract no such system as that which makes Monteverdi a favourite subject in musical history; but in Schütz's chaos the elements may at any moment come together in some strange work of art that fits into no historical or technical scheme but speaks clearly to us through its own coherence. Schütz's "astute friend" always knows what he is doing and whither his work is leading; but, except in a madrigal here and there, which was not his proper business, he does not produce a convincing work of art so often as Schütz who seems to have no proper business at all. It is to the astute, logical Italians that we must look for the progress and consolidation of musical art in general during the 17th century; but we must not let the enthusiasm of historians make us think that such a century of progress was a period of great music. The historians themselves are apt to neglect the intrinsic values of the 17th century compositions and to estimate them merely for their tendency towards something that was to take convincing shape later. The early 17th century was, in fact, musically not unlike what we have so far experienced of the 20th; the eyes of musicians and music-lovers were at the ends of the earth prophesying Wagner, when all that the whole century could finally achieve was the *da capo* form of aria.

Monteverdi and his fellow monodists had, in no mood of caprice, moved in the one direction that was universally important for music; yet their formless declamation soon palled, and its method survived only by becoming codified into the formulas of recitative, which are happy idealizations of Italian speech-cadence, and which survive as dramatic idioms in all music even at the present day. The "invention" of recitative has been ascribed to this or that monodist, with as little room for dispute as when we ascribe the invention of clothes to Adam and Eve. Any vocal music which, whether from inability or from disinclination, avoids organizing symmetrical melody, will be called recitative. When Wagner was still a subject of controversy, critics on both sides used to say that *Das Rheingold* was all recitative.

Two tendencies converged to make music become formal after the "first fine careless rapture" of monody was spent. First, the dramatic stage, with baroque scenery in magnificent development as early as 1667, in Cesti's *Pomo d'Oro,* greatly encouraged the ballet; so that when serious musicians cultivated the stage they also cultivated dance-music. This, however, was less important than the rise of the violin. Monteverdi had already understood its importance; and one symptom of the decadence of polyphony had been the growing habit of solo-singers to sing the top parts of madrigals with all manner of ridiculous flourishes. Persons less legendary than King Cole felt the fascination of the "tweedle-dee" of the fiddle; the great Dutch polyphonist Sweelinck (*q.v.*) used to adorn his organ works with passages of *imitatio violinistica;* and the last quarter of the 17th century saw the brilliant work of Biber with his queer abnormal violin-tunings, and the sober classical *sonate da chiesa* and *sonate da camera* of Corelli (*q.v.*). Artistically as well as morally this development of the violin was healthier than that of the voice, wherein coloratura singing tended to become an acrobatic monstrosity though it had first been regarded as a means of emotional expression. A talent for the violin was no danger to a boy; but a beautiful voice put a boy in deadly peril in an age when all the great opera-singers were *castrati.* Even Haydn had a narrow escape in his youth.

And yet there is, on the whole, more beauty than decadence in the vast mass of solo vocal music produced between 1630 and 1760. That period takes us from the advent of mature instruments and instrumentalized music to a time beyond the death of Handel. Except for the device of the ground-bass (*see* VARIATIONS) the first form that emerged from chaos organized itself on a method of balance between a solo voice and a group of instruments, together with a development of melodic form by means of a firmly-established classical key-system. The result was the classical aria, one of the most effective art-forms ever reduced to the capacity of normal musicians. It entirely destroyed the dramatic character of opera for a whole century; but this has been lamented with unnecessary vehemence. With the exception of the early monodic works and of Purcell's *Dido und Aeneas,* opera before Gluck is not an art-form at all; it is merely a name for the spectacular conditions under which the 18th century public could be induced to listen to a string of thirty arias by one composer who could either handle no other forms or find no listeners for them. The article ARIA shows the intimate connection of this form with that of the CONCERTO. Other art-forms developed in the 17th century for use in the 18th are discussed under CANTATA, OPERA, ORATORIO, SONATA, SONATA FORMS, and SUITE. Matters of style and texture are discussed in CHAMBER MUSIC, HARMONY and INSTRUMENTATION. The articles on monodic composers include CACCINI, CAVALIERI, CESTI, PERI and MONTEVERDI, besides ARTUSI and BANCHIERI who wrote against Monteverdi's earlier works with well-grounded demonstrations of their subversive effect on pure polyphony. The survival of polyphony in grimy and pompous decadence is represented by Pitoni, and later and more as a renascence by LOTTI. Early violin music is represented by BIBER and CORELLI.

The short career of PURCELL (*q.v.*) ends twenty years after the death of Schütz and ten years after the birth of Bach and Handel. Almost any random quotation from Purcell might be by a composer of the calibre of Bach or Handel. Purcell is one of the greatest contrapuntists that ever lived; one of the greatest inventors of themes; one of the greatest masters of declamation; and a completely mature master of early orchestration. And his fellows in the English music of the Restoration, Pelham Humfrey, Child and Blow were no mean spirits. Burney devotes an entire plate in his *History of Music* to examples of "Dr. Blow's crudities"; and later historians need look no farther afield for examples of intelligent prophesy. But the Restoration music lacks one thing; and that is power of composition. Purcell, in small dance-forms and short lyrics, is unsurpassable. But his only chance of getting through a sustained movement is when he writes on a ground-bass. In this fascinating forlorn hope of English music we see the fruit of nearly a century of bold endeavour ripening a generation too soon. Parry ascribes the patchiness of Purcell to the subtle humour of Charles II. in sending his best chorister to learn from Lully, the master of the French ballet-opera, how to write English church music. But Lully is not patchy, and Purcell's music is a crazy-quilt, purple with foreshadowings of the music of the future.

6. BACH, HANDEL AND THE NEAPOLITAN SCHOOL

If all music between 1685 and 1759 were annihilated except the

work of Bach and Handel, the ordinary music-lover would miss nothing but a large collection of decorative and decorous violin music and a still larger collection of arias; and to most of these favourite *gemme d'antichità* the mid-19th century editor has contributed much of their lusciousness. For us the age of Bach and Handel is the age of nobody else in music. But the contemporaries of Bach and Handel thought of Handel as a fashionable opera-writer who with advancing years developed choral music as a pious fad; while nobody thought of Bach except people within coaching-range of Saxony where Bach was known as a wonderful organist and an impracticably deep scholar. The polyphony of Bach and Handel stands almost alone in an age when polyphony was utterly unfashionable. It was inculcated as a staple subject in musical education; but to carry it into mature art was to discuss Latin grammar in the drawing-room. The opportunities and the difficulties of early symphonic orchestration alike arose from the neglect of polyphony after 1750. Apart from Bach and Handel, that neglect can be traced much further back; and it characterized musical connoisseurship much later; so that Burney could say of Philipp Emanuel Bach that wherever he got his beautiful and natural style from it was not from his father, for that eminent organist, though profoundly versed in all devices of canon and fugue, was so fond of crowding all the harmony he could into both hands that he must inevitably have lost melodic grace.

The vast and accurately-perfected aesthetic system of Bach and the improvisatorial opportunist eclecticism of Handel are discussed in the articles on those masters, and also under the headings of ARIA, CANTATA, CONCERTO, CONTRAPUNTAL FORMS, COUNTERPOINT, FUGUE, HARMONY, INSTRUMENTATION, ORATORIO, SONATA FORMS and SUITE. But, while this information covers the aesthetic values of the period, it tells us little of its historic trend. We must not look for light from the "spirit of the age" as shown in its politics or even in its religious history. Palestrina writes, from habit and preference, a devout music which neither Luther nor the Council of Trent could blame as representing the spirit of the age; and Bach achieves the ideal Lutheran music while Voltaire is at the court of Frederick the Great.

The music that pleased the contemporaries of Bach and Handel was that which continued, not too elaborately, the Neapolitan tradition founded by Alessandro Scarlatti. Lully (an Italian by birth) took this tradition to France, and transformed Italian opera by encouraging the French taste for the ballet. Rameau, greatest of classical French composers and epoch-making theorist, carried on the Lully tradition in opera, and joined forces with the exquisite school of clavecinistes, whose leader, Couperin, was admired and imitated by Bach in his suite-forms. Italian violin music and concertos in the Neapolitan style were produced by composers who were also great players. The enormous industry of Bach and Handel was nothing unusual. Arias could be written as easily as letters, and distributed by thirties in operas. Oratorios and church music, though less fashionable, were more highly organized; mainly because they kept choral music in being. And thus the Neapolitan tradition of choral music passes straight into the polyphony of Mozart, quite independently of Handel and wholly ignoring Sebastian Bach, of whom Mozart knew not a note until he was grown up. Meanwhile cultured Europe was unvexed by doubts as to who were the immortals. The Handel-Bononcini rivalry had been little more than a nine-days' wonder. Six years after Handel's death, the seven-year old Mozart in London dedicated his violin-sonatas to Queen Charlotte in the hope that under Her Majesty's protection "je deviendrai immortel comme Haendel et Hasse." Graun would probably have been the third name of European repute; and Telemann, the most voluminous composer of his voluminous day, was a great figure in his own country. As for Bach—everybody in London knew Mr. J. C. Bach, of the Bach and Abel concerts, and report said that his father had been a great musical scholar.

Behind the dignified musical history, but not (like Sebastian Bach) aloof from it, vital forces were at work in comic music-drama. This was admitted by way of *intermezzi* between the acts of serious operas. One of these intermezzi, *La Serva Padrona* by Pergolesi (known in the 19th century by his conventional *Stabat Mater* for two-part female chorus) not only broke from its moorings, like many other intermezzi, but found its way to Paris where it created a furore of popular success and precious disputation dividing musical Paris into *Buffonnistes* and *Anti-buffonnistes*. Except for the untimely blossom of English opera in the hands of Purcell in the previous century this is the only moment at which opera after Monteverdi and before Gluck (with all respect to Rameau) becomes a genuine art-form instead of a concert on the stage.

Biographical articles dealing with the following named composers who belong to this period: the violin writers CORELLI, GEMINIANI and TARTINI: the clavier writers COUPERIN and D. SCARLATTI (the Paganini of the harpsichord and a most unclassical son of the founder of classical tonality); the opera writers (which meant the all-round musicians) DURANTE (Francesco), GALUPPI (who certainly never wrote Browning's "sixths diminished, sigh on sigh"!), LEO (Leonardo), PERGOLESI and SCARLATTI (Alessandro). RAMEAU is equally important in three capacities as a master of French opera, a livelier master of instrumental music, and an epoch-making theorist. German beginnings of serious and comic music-drama were sumptuously inaugurated at Hamburg by KEISER (*q.v.*) whose influence is traceable in Handel's first opera *Almira*.

7. THE RISE OF DRAMATIC MUSIC AND THE SONATA STYLE

The fashionable distaste for polyphony was a mere negative force in the early 18th century. The positive force was, as in the monodic revolution a hundred and fifty years earlier, an impulse towards drama. Unlike the monodists who, when they rejected polyphony had no power of composition beyond the single musical sentence, the 18th century musicians could easily cover ten minutes with a well-balanced form; and the problem of making such forms dramatic was no longer confined to the monodist's problem of making them rhetorical. On the contrary, the rhetoric had to be demolished; for the action of drama is not the action of rhetoric.

The distaste for polyphony was no unfavourable condition for the rise of dramatic music; it was the inverse aspect of a growing sense of contrast in various textures cheap and valueless in themselves. The rest of the story is told in the articles, INSTRUMENTATION, HARMONY, OPERA, SONATA FORMS, and GLUCK, BEETHOVEN, HAYDN, MOZART.

It is inadequate to call Gluck a "reformer" of opera. Music itself was not dramatic before Gluck made it so. Hence it is a mistake to separate Gluck's "reform" from the whole process of the development of the sonata style. Lastly, we miss the whole meaning of that style unless we realize that as soon as it arose the purely instrumental music became more dramatic than any drama. At the same time it also became more powerfully architectural than any earlier music. The art comprised in the works of Haydn, Mozart, and Beethoven constitutes one unbroken aesthetic system, more universal in emotional range than any art since Shakespeare, and as perfectly balanced as the arts of ancient Greece. Until the end of the 19th century it would have seemed a paradox to maintain that Beethoven's work belonged to the same aesthetic system as Haydn's and Mozart's; for critics were slow to escape from the habit of estimating works of art by the face-value of their subjects and the dignity of their language. And the language of Haydn and Mozart corresponds with that of the comedy of manners, while Beethoven is the most tragic composer that ever lived. Nevertheless the huge expansion which music underwent at Beethoven's hands was no revolution, and the popular idea of Beethoven as a revolutionary artist is based on two errors; first, the commonplace habit of seeking parallels between the works of genius and the personal eccentricities of their authors; and, secondly, the inadequacy of orthodox doctrine on musical forms. This inadequacy results from the fact that the doctrines are contemporaneous with the compositions and are accordingly hostile to all but the easiest conventions. A proper grammar of a classical art requires something of the attitude of

the unjustly-despised Byzantine scholars who sacrificed aesthetic pleasures in humble devotion to the task of securing the texts. It is when the languages are dead that they live for ever and suffer no corruption.

We need not expect scholarship in the orthodoxies that were current as to musical forms used in the lifetime of the classics themselves. (*See* FUGUE for a demonstration of the irrelevance of traditional doctrine on that art-form.) Still more impertinent is our orthodoxy on sonata-forms. It ignores the differences between Haydn and Mozart which are as radical as any innovation Beethoven introduced; and, having thus cut away all ground for appreciating Beethoven, treats him as the central symphonic classic, and also as a stupendous revolutionary. This result is correct as far as it goes: central classics can be stupendous revolutionaries. But correct pious opinions are the healthier for facts that can give us a right to them; and the beginning of the 19th century was unfortunately the beginning of an age of humbug in musical education. (*See* CHERUBINI, who, however, has other claims to our respect.) One consequence is that many a musical revolt purports to revolt against the classics when its nearest contact with classical forms has been the perky generalizations of textbooks by writers who regarded the great masters as dangerous, and who deduced their rules from the uniform procedures of lesser composers. Now these procedures were often derived from one or two popular works by the greatest men: thus Beethoven himself produced one model sonata (op. 22)—if its "first subject" had only been long enough. And if Mozart's great C major quartet had not such a subversive introduction it might (and did) serve as a jelly-mould for all the quartets of Spohr. Take another jelly-mould from Spohr, and you have classical tradition.

But now comes the fundamental difficulty in all attempts to distinguish the classical from the pseudo-classical. Every individual work must be judged on its own merits. No generalizations are trustworthy. Many movements by Mozart are as alike as peas. But, being alive, they are not as alike as buttons. With Mozart and Haydn the individuality of each work is all-important for the critic, and if he neglects this all that he says about the common form is superficial. On the other hand, the materials of Beethoven's work developed so rapidly that he seems to be driven to invent a new technique for almost each composition. Hence the external differences become obvious; and unless the critic penetrates to the common form he is lost.

With the symphonic classics we enter the period when these considerations become important; for there is no gulf between that period and our own. No musical art known to Haydn has suffered, like the art of Bach, a period of total eclipse; nor, on the other hand has it had preserved a character that Haydn could have understood. Not much light is shed on Haydn and Mozart by calling them court composers, and little more on Beethoven by calling him a child of the French Revolution. In an age of court patronage Bach the theologian had been inspired to write warlike music not more by ancestral memories than by scriptural texts of war in Heaven. Mozart and Haydn were restive in the service of courts and their musical language was that of the comedy of manners when it was not racy of the soil. In Paris, where musicians might be expected to know most about the French Revolution, the modest, lovable Etienne Méhul (famous for the biblical opera *Joseph*) produced his prettiest comic operetta *Le Jeune Sage et le Vieux Fou* in the year of the Terror; and on French music the immediate effect of these tremendous days was the rise of a new type of sentimental opera concerning the hair-breadth escapes and sufferings of the political prisoner rescued by the heroic wife. Hence Cherubini's *Les Deux Journées* (*The Water-Carrier*) and Beethoven's *Fidelio*. Genius is the wind that bloweth where it listeth. In Bach's day Beethoven would have been musical interpreter of the Apocalypse; and in this 20th century Bach would be something like Dr. Schweitzer.

When we contemplate the impassable gulf that separates Bach's art not only from Haydn's and Mozart's but from the apparently more kindred spirit of Beethoven, we find it hard to realize that contemporaries were unaware of any catastrophic development. In the case of choral music a little study shows us that its forms and language remained Neapolitan. Haydn's and Mozart's masses are flamboyant Neapolitan music; and Michael Haydn, who was merely decorative as an instrumental composer, was rightly thought by his brother to be the better man at church music. Again we regard Philipp Emanuel Bach as bridging the gulf between his father's and the new art; but Philipp Emanuel was writing quite mature sonatas in the year of his father's B minor Mass and his last set of sonatas was produced in the year of Mozart's *Don Giovanni.* Clementi, born in the year after Bach's death, was an infant prodigy of eight when Handel died; he had developed an extraordinarily massive and genuine pianoforte technique (more powerful than beautiful) when he encountered Mozart in a musical tournament, and he survived Weber, Beethoven and Schubert. Nothing can be gained by a further attempt to summarize this "Viennese" period. We may call it the period of the sonata and of Mozartean comic and French romantic opera. More particular information is given in the following technical and categorical articles: HARMONY (on Key-relations); INSTRUMENTATION; MELODY; OPERA; ORATORIO; OVERTURE; RONDO; SCHERZO; SONATA FORMS; SYMPHONY; VARIATIONS, and the biographies ABEL (K. F.); BACH (K. P. E.); BEETHOVEN; BENDA; BOCCHERINI; CHERUBINI; CLEMENTI; DITTERSDORF; DUSSEK; GLUCK; HAYDN (F. J.); MOZART; PICCINNI; SCHUBERT; SPOHR; WEBER (C. M. F. E. VON).

8. THE ROMANTIC PERIOD

With the romantic period comes the development of lyric music in the forms of songs and short pianoforte pieces. Schubert, Weber, Spohr, Mendelssohn and Schumann would be the romantic composers in this sense, and many contemporaries would have added Cherubini to the list, for they thought of him not as the martinet who directed the Paris Conservatoire but as the composer of *Les Deux Journées.* Romanticism was thrilling and classicism was cold.

But this list traverses another sense of the term which opposes the romantic to the classical. The classical is in this connection identified with both formalism and mastery. Mendelssohn and Spohr chose romantic subjects to no purpose; their mastery was unromantically slick (there is no other word for it) and Spohr's forms were more thoroughly ascertained than anybody else's except those of Mozart's brilliant pupil, J. N. Hummel. Mendelssohn's forms were free; but he never got into difficulties, so how could anybody recognise his freedom? Philipp Emanuel Bach's vein of sentimental rhetoric was not only typically romantic but enabled him to write some genuinely lyrical songs. J. Schobert is another romantic writer who influenced Mozart at an impressionable time of his boyhood. Every thrilling modulation in Beethoven's music was romantic, and so were the double-bass passages at the beginning of Cherubini's overture to *Les Deux Journées.*

But the facts are more interesting than this generalization. Mastery is not the line of cleavage that ranges Spohr and Mendelssohn on the one side and Schubert, Schumann and Chopin on the other. Beethoven's later tonality and polyphony had made music ready for lyric forms which he himself adumbrated in a few of his bagatelles for pianoforte and some sporadic good things in his songs. Mendelssohn and Spohr took up song-writing and produced in that line masterpieces for the drawing-room. We ought not to despise the drawing-room. Schubert became the supreme master of song, and Schumann achieved greatness there as in his pianoforte lyrics; but you might as well think of Keats and Shelley as writers for the drawing-room.

Another line of cleavage separates Schubert from Schumann and Chopin as fundamentally as it separates him from Mendelssohn and Spohr. When Schumann and Chopin handle the large classical forms they show obvious weaknesses. Schumann makes an effective new artificial sonata form out of his stiff antithetic epigrammatic style, as a man might construct a landscape in mosaic. Chopin merely shows that he has taken the sonata forms uncritically from Hummel, though the first two movements of the B flat minor sonata are almost as happy in their classical form as the Ballades are in Chopin's unique way. But Schubert's large

forms have only the weaknesses of youth, and their positive qualities and tendencies set him above all schools and indicate that if he had lived we should not so readily have closed a historic chapter with Beethoven. The mastery that Schubert lacks is not anything that Spohr could have supplied. Younger composers with new worlds to conquer could with some truth accuse Spohr of playing with classical forms as one might play chess; but they could never have so accused the Schubert that died young or the Schubert that might have reached old age.

We do not know what Mendelssohn might have achieved if he had lived longer. His influence on the musicians he knew personally was wholly stimulating and good. But he too, seemed able to play chess with symphonies, oratorios and songs with and without words, while other composers were grappling in their music with real life, perhaps confined to one narrow art-medium like Chopin, or, like Schumann, deserting lyrics for larger forms or some artificial hypothesis, or, like young Berlioz, kicking right and left against all teaching and all criticism while dreaming new wonders of orchestral sound, and correctly dreaming the practical means to them also.

Meanwhile a greater than Berlioz was arising, a dreamer of new sense as well as of sound. Mendelssohn and Schumann saw only the beginning of Wagner's development, and could not feel very sure that this voluble and stormy reformer of music-drama was really likely to achieve anything better than the tinsel of the astute Meyerbeer who dominated the world of cosmopolitan opera. The early style of Wagner is indeed an alloy of many metals besides iron and potter's clay; but even in the 'forties his work marks the eclipse of the first romantic period and the dawn of another and greater epoch.

The art-forms peculiar to the Romantic period have no definite names, though composers began to use many literary titles, such as Ballade, Romance (already used by Mozart for slow movements in sonata-form), Nocturne and the like. Dance-rhythms, especially those of Poland, were brought into prominence in the pianoforte music of Chopin. Mendelssohn's invention of the song without words was very successful, but the notion is too facile to lead far, or always, even in Mendelssohn's hands, to justify its existence. Fantastic titles, used in the 18th century by the French clavecinistes, assumed great prominence in the pianoforte works of Schumann who created a new type of long connected cycles of epigrammatic little pieces. The articles PROGRAMME MUSIC and SONG concern this period vitally. Relevant biographical articles are CHOPIN, MENDELSSOHN, SCHUBERT, SCHUMANN, SPOHR, WEBER; while the crowd of pianoforte composers whose brilliance on that instrument obstructed all wider musical prospects, include the respectable HUMMEL, the less respectable STEIBELT and the Irish writer of beautiful pre-Chopin nocturnes, FIELD (John).

9. THE WAGNERIAN DEVELOPMENT AND THE RENASCENCE OF CLASSICAL FORM

Wagner formulated his principles of music-drama long before he matured his musical style. It is impossible to understand the musical history of the second half of the 19th century until we frankly admit that the composers of instrumental music saw in Wagner not only the subversive operatic theorist and erotic dramatist but the composer who was popular because of the salvation-army religiosity of the end of the *Tannhäuser* overture and the downright vulgarity of the entr'acte before Act III in *Lohengrin*. His theories and methods might be controversial, but these lapses never were.

Strange to say, Wagner received something like recognition from the doyen of classical champions, Spohr, whose attitude to Beethoven had been merely condescending, but who saw in *Der Fliegende Holländer* and *Tannhäuser* interesting, if faulty, works which well deserved painstaking production at his theatre at Cassel. Schumann too, after joining in the general hostility towards *Tannhäuser*, frankly recanted and praised its many noble features. Personally he and Wagner did not get on so well; he found Wagner too talkative and Wagner found that Schumann had nothing to say. Later on when Wagner was in exile, *Lohengrin* found a powerful champion in Liszt at Weimar.

Liszt presented another problem to sober musicians. Wagner himself at first saw nothing in Liszt but the virtuoso who, when asked for music, would give you a fantasia on *Robert le Diable*. On the other hand, persons who became bitterly hostile to all the musical tendencies that Liszt fostered went out of their way to declare that no such wonderful interpretations and technique as Liszt's pianoforte playing had ever before been heard on any instrument or orchestra. All Liszt's gestures were superb, from his monumental immobility at the pianoforte to his princely and often really self-sacrificing generosity to other musicians. And at the age of 37 he made the most superb of all his gestures in giving up playing in public. And so the one incontrovertible power of his art became a legend and his actual activity became the championship of unorthodox artists. He took to composing on a more ambitious scale than that of the marvellous pianoforte virtuoso; and became himself the leader of a new development of romantic music. Although he took little pleasure in counterpoint he had none of Berlioz's clumsiness in harmonic texture; and his orchestration, in which his first efforts had the secret assistance of Raff, was always brilliant and novel, though it never caught the Berliozian fire or plumbed the Wagnerian deeps. Liszt realised no more than Berlioz the true musical purport of the new ideas which his symphonic poems and Berlioz's symphonic-dramatic phantasmagorias were putting forward under all kinds of literary and pictorial names. While the new romantic composers purported to be devoting instrumental music to the illustration of literature (*see* PROGRAMME MUSIC) they were really struggling with a new musical time-scale.

As we have already seen in the present article and in the discussion of HARMONY, musical history may be traced in terms of the time-limit over which the listener's memory is brought into play. In the 16th century that limit is from accent to accent; by the end of the 17th century it ran from phrase to phrase. The great architectural forms of Bach could stretch it easily to six minutes, and, in extreme cases to ten. The rise of the dramatic sonata style did not greatly enlarge the time-scale; for there are few well-constructed sonata-movements that exceed a quarter of an hour, though on no smaller scale could Beethoven have prepared the famous harmonic collision that gave such offence in the first movement of the Eroica symphony. Now this ten-minute time-scale obviously compelled musicians to handle the action of an opera by means of conventions. (*See* OPERA.) It is less obvious that it also produced a similarly conventional artifice in the relation of sonata-forms to their emotional content. A design may complete itself in ten minutes while raising emotional issues that cannot be dealt with in less than forty. And so the sonata-forms are grouped in from two to four (rarely more) movements as artificially as the musical sections of classical operas. Wagner's enormous achievement in music-drama consisted essentially in giving music the same time-scale as that of the drama. As with all first solutions of an art-problem he achieved an extreme case, for his drama became cosmically slow. But from *Das Rheingold* onwards every Wagnerian opening instantly, and without any introductory gestures, lays down the lines of its vast time-scale, to the utter bewilderment of his contemporaries who continued to expect *Das Rheingold* to show its pattern on Beethoven's time-scale, just as Beethoven's contemporaries had heard seven *pianissimo* bars on the chord of E flat, not as that vaulted vacancy appears in the middle of the andante of the C minor symphony, but as it would have sounded if it were intruded into an andante by Mozart.

Nobody else before Richard Strauss achieved Wagner's mastery of his new time-scale; and few, if any, of his contemporaries, whether hostile or friendly to him, realized its existence. Liszt was trying, in his symphonic poems, to make a music that filled its half-hour or forty minutes continuously; but his first effort of the kind, *Ce qu'on entend sur la montagne*, spends the first twenty of its forty minutes in a series of introductions, and the remaining twenty in retracing the series backwards. And his more successful efforts, such as *Orpheus* and *Les Préludes*, are either essentially lyric or not on the new time-scale at all. He never achieved so

effective a symphonic poem as Schubert had already long ago unwittingly produced in the "Wanderer" fantasia. Musicians who might not have been repelled by new doctrines of musical form found Liszt's style even more demi-mondaine than that of the early works of Wagner; nor did Liszt show any tendency to purify it. Moreover he rivalled Meyerbeer in the efficiency of his press-bureau by which he made propaganda, often in his own fluent French, more generously for others than for himself

Meanwhile another musical development was arising, conscious of its continuity with the past, and, like Judaism as defined by Matthew Arnold. tinged with emotion in the morality of its aesthetic principles. Joachim, as great an interpreter on the violin as Liszt on the pianoforte, at first found in Liszt a congenial friend, until he saw his compositions. These horrified him, and the horror completed an estrangement already begun by his dislike of the atmosphere of Liszt's press-bureau. He and his younger friend Brahms were united not only in general musical taste but in personal devotion to the heroic widow of Schumann, who, after her husband's tragic and lingering death, was bringing up a large family on the proceeds of her concerts. These three artists soon came to regard the musical atmosphere of Weimar, where the *Lisztianer* gathered around their master, as unhealthy. In the correspondence and mutual criticism of Brahms and Joachim the word *Lisztisch* became synonymous with "devilish"; and indeed it is true that any characteristic Lisztian and many Wagnerian idioms would have a disgusting effect if intruded into Brahms's music. To-day we can be wise after the event and find matter for regret in the drastic out-spokenness of Joachim and Brahms which elevated matters of taste into questions of artistic honour. If Liszt could have been contented with *sachlich* criticism on definable issues of technique without requiring attestations of sympathy and enjoyment, and if Joachim could have resolved matters of taste into questions of artistic proportion, the neo-classical and neo-romantic musicians would have joined forces instead of condemning each other. Similar economies might be effected in nature if lions could be converted to vegetarianism.

The controversy was unequal, in two compensating ways. Wagner had a tremendous, if acrid, fluency in prose and did not care where his vitriol might alight. Moreover, Wagnerian and Lisztian music was much easier to write about, whether in attack or defence, than music which had no literary aspect. Brahms, like Wagner, needed and found friends who adored his music, but he hated the idea of a press-bureau and snubbed anybody whose compliments aroused the least suspicion of flattery. These drawbacks had their own compensation. It might be difficult to write as interestingly about Brahms as about Wagner; but Wagner, whether in exile or enthroned at Bayreuth, had Wagnerian music-drama as his whole province, while Brahms reigned over the whole of the rest of music, instrumental, choral and lyric. If criticism came to persecution, on the whole the neo-classics had the worst of it; for Brahms had no equals since Joachim gave up composition, and the position of a champion of classical forms was easily confused with that of a persecutor of the prophets of progress. As a matter of fact, Brahms was no anti-Wagnerian and was annoyed when his friends bracketed Wagner with Liszt.

But, apart from the clash of flying inkpots, the recognition of Brahms was assured by two facts; first the propaganda of his work not by words but by consummate and authoritative performance, and second, the very fact that his music required an experienced love of music for its understanding. A man might become an enthusiastic Wagnerian or even a well-equipped conductor of Wagner's music and be as the brutes that perish about symphonic orchestration, choral music, chamber-music, songs and all pianoforte music except Chopin. But it was long before any musician could venture to tackle Brahms's music on any basis except that of the most comprehensive musical culture and technique. Brahms lived long enough to become worshipped unintelligently; and after his death (in 1897) the reaction was more evident than the fashionable worship had been. There are signs that the reaction is over by now.

The Wagnerians felt deeply that their propaganda was incomplete for lack of a master of purely symphonic music. This they found in Bruckner (*q.v.*). Brahms was appalled by the clumsiness of Bruckner's forms, and the most official Wagnerians admitted the frequent lapses of their symphonic master. On the other hand Bruckner's Nibelungen-tetralogy openings to his symphonies obviously dwarfed the terse themes of Brahms. By the time Brahms and Bruckner had come into their own, the public had long lost all sense of form in its appetite for bleeding gobbets of musical butcher's-meat hacked from the living body of Wagnerian music-drama and served up in concert rooms as *Waldweben*, *Karfreitagszauber* and *Walkürenritt*. After this it was pedantry to quarrel with any symphonic composer's form so long as his openings were vast enough. Brahms was no pedant; obvious weakness of form and style did not deter him from being the first to recognize Dvořák (*q.v.*); and he was drastic in his rebuff of anybody who thought to flatter him by talking against Wagner.

The song-writer Hugo Wolf (1860–1903) became recognized too late to be made use of as a lyric-pawn in the Wagner-Bruckner party politics of music. As far as his theory of song can be summarized, it consists in the application of Wagnerian declamation to lyric poetry. If his practice were not better than this essentially prose theory of verse-rhythm (*see* RHYTHM) and the perky censorship of classical musical declamation that goes with it, Hugo Wolf's art would not have survived his short and ailing life. But it is deeper than the theories on which it is supposed to rest and its apparent revolt from lyric melody only partly conceals a powerfully organized lyric form, and does not at all conceal a great gift of characterisation.

10. NON-GERMAN MUSIC OF THE 19TH CENTURY

While these great issues were being debated in Germany, the music of other countries was awakening from long sleep or outgrowing infancy and provinciality. France had, since Rameau, been remarkably content to have its music dominated by foreigners. Before Rameau, French opera was established by the Italian Lully. After Rameau it was reformed by the German Gluck. Early 19th century French classicism was dominated by the Italian Cherubini. Another Italian, Rossini, was in the prime of his life absorbed by Paris; and the result was *Guillaume Tell*, with its rich orchestration and grandiose forms. But the crown of French opera was imposed on it by the German Jew Meyerbeer. The pretensions of the native French composers were more modest, except for the volcanic eruptions of that typical Gascon Berlioz. The popularity of Gounod (1818–1893) rested on the same misunderstanding of the meaning of art as the vogue of Doré in the capacity of an illustrator of the Bible. *Faust* was a success. Another development, more improvisatorial, uncertain of its style, but fundamentally sincere, was initiated by the Belgian, César Franck (1822–1890) (*q.v.*). From him, and not from the more prolific and facile Saint-Saëns, originated the main stream of modern French music. His style had too much affinity with Liszt to please the musicians who continued to regard Liszt as the author of all modern musical evil; but he achieved mastery in a wide range of forms all his own and he never wrote for effect.

In Italy music after Rossini was long contented to imitate the things in which Rossini was imitable. These were the mechanical cultivation of *bel canto* and the use of a full orchestra to support the voice in a thick unison of the melodic instruments, with a brassy dance-rhythm in the rest, and the big drum and cymbals to mark the rhythm. The genuine melodic inventiveness of Bellini and Donizetti did little to improve the other categories of the art; but in Verdi (1813–1901) a new genius was arising together with the Risorgimento. In *Rigoletto, Il Trovatore* and *La Traviata* Verdi's dramatic sincerity triumphs over the defects of a musical texture which still clung to traditional squalor, though strokes of genius occurred unpredictably in the orchestration of many passages. In *Aïda* the style silences all cavil; and in *Otello* (written at the age of 74) and *Falstaff* (written at the age of 80) Verdi created a new kind of opera, Wagnerian in its perfect continuity and dramatic movement, but utterly independent of Wagner's style and method.

Bold prophets in Beethoven's time had been heard to say that a great musical future was in store for Russia. The fulfilment of

this prophecy was long delayed, for when Rubinstein averred that Michael Glinka (1803–1857) was the equal or the superior of Haydn and Mozart he expressed an opinion which could have occurred only to a Russian, and then only as a patriotic paradox. Rubinstein himself achieved only a weak cosmopolitanism in his voluminous compositions, though his pianoforte playing remained, for all its waywardness, till near the end of the century, as the most monumental power of interpretation on that instrument since Liszt. The first composer to make a genuinely Russian music recognized over the whole civilized world was Tschaikovsky (1840–1893) whose symphonies were held by some critics to have eclipsed those of Brahms. This was the eclipse of drama by melodrama. The true merits of Tschaikovsky were eclipsed by the rising reputation of his less immediately successful contemporaries. Moussorgsky (1835–1881) had the posthumous fortune to have his two great operas *Boris Godunov* and *Khovantschina* revised by Rimsky-Korsakov (1844–1908) the most brilliant contemporary master of pure orchestral colour and texture. This was unquestionably good fortune in so far as it speeded these unconventional works on their way into the wide world; but something like indignation accompanied the later study of Moussorgsky's original scores, with the discovery that besides altering clumsinesses Rimsky-Korsakov constantly meddled with features in his friend's style that were far beyond his comprehension.

The 19th century was over before any musician on the continent could be persuaded that there were composers in England. Schumann had repeated St. Gregory's pun about Angles and angels when he hailed Sterndale Bennett as "ein englischer Componist"; but the trials of English musical life dried Bennett up. All who knew and loved him denied hotly that his music reflected Mendelssohn's; and perhaps, to-day, a leisurely study of it might vindicate his independence. Macfarren (1813–1887), who succeeded Bennett in his educational offices, was a widely-cultured musician whose influence for good was frustrated by his violent conservatism which co-existed with a fatal readiness to be led by faddists. (*See* HARMONY.) The renascence of English music began in the work of Parry (1848–1918) and Stanford (1852–1924). They put an end to the provincial absurdities of British oratorio tradition, and consistently set great literature in a way that revealed to contemporary poets that the antithesis between musical and general culture was false.

They also had wide and deep influence as teachers of composition.

Still, recognition of English music on the continent was rare and capricious. Englishmen wrote church music for the stage, stage music for the church, organ music for the orchestra, and, as far as they had any orchestral ideas at all, orchestral music for the organ. The one famous English composer who could be understood on the continent as saying intelligible things in fit terms, was Sullivan, with his Savoy operas. And his serious colleagues and critics urged him with owlish solemnity to produce no more light masterpieces but to go on with his serious and luscious Golden Legends and Martyrs of Antioch and generally to consummate the final merging of English music into "The Lost Chord." We may thankfully hope that that chord is now lost for ever; but the Savoy operas live, and might, without delay to their popularity, have risen to the position of great music if Sullivan had had enough steadfast love of music to finish those parts of his work to which the public did not listen; if for example, he had provided his operas with better orchestral introductions than the perfunctory pot-pourris of their favourite tunes which he calls overtures and which are quite as long as artistically-decent overtures would have been.

It is customary to explain the failure of all but the most recent British music by saying that the native art was crushed by the ponderous genius of Handel. It is a great pity that the united ponderosity of Handel and the middle-weight Mendelssohn could not avail to dam the output of oratorios by composers who might have become good song-writers or even acquired some knowledge of orchestration beyond that of choral accompaniment. The complaint of foreign domination is nonsense. No nation has had its music so long and so completely dominated by foreigners as France; and French music has always remained exclusively French and has made thoroughly French artists of the foreigners who dominated it. The traces of foreign influence on English music have always been the echoes of individual phrases or mannerisms.

While Englishmen echoed, as fashions changed, Mendelssohn, Brahms and Debussy, they learned no technical lessons from them. Such mechanical echoes show no foreign domination, but are the best proof of an inveterate provincialism and the kind of ignorant and irritable independence that goes with it. Since music ceased to be an integral part of an Englishman's culture (about the time of William and Mary) their musicians, as a rule, began its serious study far too late. The language of music cannot be begun at the age of 19 like courses in law or medicine. Their universities have played a considerable part in shaping British musical destinies; but a mighty Oxford treads on the tongue of the encyclopaedist who would pursue this topic.

(D. F. T.)

11. MUSIC OF THE 20th CENTURY

It has often been said that the 20th century witnessed as drastic a musical revolution as that of any period in history. The attitude of the public as well as the internal evidence of the music clearly showed a definite rupture with the immediate past. At first the radical new departures aroused indignant audiences just beginning to enjoy the colourful richness of the late romantic composers like Richard Strauss and Nicolas Rimsky-Korsakov and resulted in many violent demonstrations. Critics raved; composers explained; sides were taken; and societies were formed to propagate what was then called "ultramodern" music.

But even if this were not sufficient proof, a comparison of any brief portion of Arnold Schönberg's *Pierrot Lunaire* (1912) or of Igor Stravinsky's *Le Sacre du printemps* (1913) with any previous music would reveal at once how extreme the break with the past was. Yet these and other radical new works could not be easily dismissed as the misguided experiments of a few isolated eccentrics, because their novel methods soon attracted more and more followers among musicians and the public. When the nazi and soviet states in the 1930s and 1940s began to legislate against those using the newer styles, it became clear that the modernists were to be reckoned with. By mid-century, the importance of the revolution had to be admitted by almost every musician; for not a single composer had appeared since about 1920 who could write convincingly enough in the older style to win recognition. The only important late romanticists still greatly respected during this time were those like Richard Strauss (1864–1949), Sergei Rachmaninoff (1873–1943) and Johan Julius Sibelius (1865–), who had become known earlier.

There were many attempts to summarize the distinguishing marks of the new music. Most of these efforts were made by adherents of one or the other of two main factions that began to take shape around 1930: the neoclassicists, who followed the lead indicated by the later works of Igor Stravinsky (1882–), and the atonalists, who followed Arnold Schönberg (1874–1951). Since many intelligent articles were written by the composers and their followers discussing these two points of view, both were very influential; but besides these two schools, there were a great number of independents harder to deal with in critical estimates because of their avoidance of doctrinaire attitudes. The case of Béla Bartók (1881–1945), whose music did not receive the recognition accorded his more discussed contemporaries until after his death, is a rather typical example of the fate of a composer not belonging to a pressure group who preferred to let his music alone speak for him. Five years after his death, Bartók was generally regarded as superior in many ways to almost every other composer of his time.

In spite of their doctrinaire tendencies, the neoclassicists and the atonalists represented the opposite poles between which much music of the first half of the century lay; and the undeniable mastery of Stravinsky and Schönberg lent their points of view considerable weight. Because both dwelt so much on the importance of musical technique, they had often been dismissed as "formalists" concerned only with pure form devoid of musical expression. Indeed, the neoclassicists were particularly condemned for their insistence on "objectivity," but this objectivity was really a way of achieving artistic dignity and distinction by maintaining an aesthetic distance from the emotions portrayed. It was similar to the type of representation of feelings used in the baroque era, and this attitude distinguished modern neoclassicism from that of Brahms, which was truly romantic in its direct expression of dynamic emotions. True to classical precepts, the new group adhered to the representation of centrally important human feelings seen through the restless rhythmic and harmonic tension of modern technique. This double exposure of past and present inevitably suggested a commentary of one period on the other with comic or, more often, with nostalgic overtones. This school began to decline in influence around 1945.

The atonalists, on the other hand, were concerned with intensifying and compressing direct expression to the utmost. They continued the romantic psychology of dynamic emotions but focused it on the most subjective and unusual states of mind, related to the tormented, neurotic violence of the German expressionist theatre and painting. Their weird, fantastic and personal realm found its expression in a strict musical technique that was claimed to be a summation of all the devices of previous music, combining the formal methods of preromantic styles and the psychology of romantic music with the new techniques of the 20th century.

Most of the independents reflected a concern with elaborate musical techniques and with the avoidance of large-scale, opulent, romantic rhetoric. There was also a group of followers of the "populist" composers of soviet Russia who were under official pressure to avoid these "formalist" methods. These used a kind of romantic style drastically simplified, yet with certain contrapuntal and harmonic devices similar to the neoclassicists. Their works, particularly those by Sergei Prokofiev (1891–1953) after he returned to soviet Russia in 1934 and Dmitri Shostakovich (1906–), often met with great acclaim for their very real musical values, but few of them outlasted their first flush of success.

Technically, composers of the first half of the 20th century seemed to have been mainly occupied in breaking up the relationships between the various elements of musical discourse and in reintegrating them on a level of greater freedom. The rhythmic aspect of a work often had a comparatively independent life of its own, not emphasizing the harmonic changes or the melodic flow. Harmonies were often used for their sonorous and expressive qualities and not to underline the melody. This freedom

was usually ordered by new kinds of self-imposed formal and stylistic restrictions. The neoclassicists favoured strict mechanical regularity of pulse while employing great liberty in the irregular distribution of accents and in all the other elements; the atonalists adhered to a strict system of ordering the tones of a composition, allowing the greatest licence in other directions.

Each element within its own domain was freed from previous limitations in order to bring out its particular expressive qualities. Rhythm became highly irregular, using either assymetrical groupings of rather rapid regular pulsations or sought the other extreme of expressive rubato. Two main ideas were current about melody. One, accepting the classical use of a pronounced and definite melodic line, emphasized its rhythmic aspect by reiterations or escaped into the free development of motives like that of Gregorian chant. The other idea, derived from Claude Debussy's melodies of harmonies and Schönberg's "melodies of tone-colour," renounced the clear definition of melodic outline, treating the total sound effect of any moment as a unit to be connected to other units as single tones are in a melodic line.

In harmony, any simultaneous grouping of tones was considered acceptable provided it gave the desired qualities of tension and expression. The movement from one chord to the next usually obscured or negated classical usages, dissonances not being prepared or resolved. When music had a tonal feeling, this was more a result of melodic emphasis on tonal centres than of functional harmonic activity.

Whether new music invented new "open" forms or adapted old "closed" ones to new needs, it was permeated by the principle of continual variation replacing the classical devices of literal or sequential repetition. The older symmetry of balancing sections was eliminated in favour of drastic shortenings and lengthenings to preserve the greater tension of the assymetrical rhythmic basis. Texture became predominantly contrapuntal with a freedom of relation between voices that sometimes recalled the heterophonic practices of primitive or Balinese music and more often the linear counterpoint of the middle ages. The orchestra was dissociated into sharply defined groups of colours in order to bring out the contrapuntal and linear nature of the music; the individual instruments were often treated as soloists as in chamber music.

Perhaps the most striking general aesthetic and technical feature of the period was a new attitude toward stylization. Obviously works of music had been stylized in every period, but previous composers usually drew upon the general practices of their time for the devices used to give each work its special stamp. From 1860 on, the commonly accepted methods of the immediate past began to disintegrate rapidly. Wilhelm Richard Wagner, Hugo Wolf, Modest Petrovich Mussorgsky and others added many novel features, and by the end of the century the impressionist composers Claude Debussy (1862–1918) and Maurice Ravel (1875–1937) had stretched the use of older harmonies to the point where they no longer fulfilled their former functional capacities of pushing toward cadences and employed them as separate sonorities much as blotches of colour were used in impressionist paintings. Debussy in his later works consciously strove for a more fluid style that dispensed with classical rhythmic and melodic procedures achieving a technique that resembles the "stream of consciousness" of contemporary literature. At about the same time, Alexander Scriabin (1871–1915) invented new chords to express his sensual mysticism, and Erik Satie (1866–1925) and Ferruccio Busoni (1866–1924) were demonstrating in very different ways the "objective" attitude in their works.

Around 1908 there was an outburst of musical primitivism and expressionism that paralleled the postimpressionist reaction in painting against the tenuous world of the impressionists. From this time until about 1925, each new composer strove to invent his own vocabulary of melodies, harmonies and rhythms, as well as his own grammatical rules. Each went in search of new materials and new ways of joining them, and each work provided an opportunity of carrying some technical, stylistic or aesthetic idea to its extreme limit. For a while such stylistic relativism seemed to point toward complete anarchy. It looked as if there were going to be almost as many styles as there were works written. In Stravinsky's works, for instance, the vehement barbaric ritualism of *Le Sacre du printemps* (1913) gave way to the dryly humorous pathos of *L'Histoire du soldat* (1917) with its deliberate distortions of café music. This in turn led to a whole series of works related to styles ranging from Bach to Tschaikovsky and, in 1948, to an austere setting of the Mass using bits of musical Gothic. All of these works were done with such imagination, fantasy and authority that they furnished cues for one group of followers after another.

Similar but not so drastic changes went on within the very individual styles of Bartók and Schönberg, as each passed in his own way through a period of classicism.

This desire for total stylization can be seen as shaping the background of the entire first half of the 20th century, often with sensational results as in the works of Edgar Varèse (1885–) or of Anton Webern (1883–1945), which extended stylization to the limits of unusualness, or in the later works of Erik Satie and in those of Virgil Thomson (1896–), which carried it to the opposite extreme of simplification.

Against this experimental background, however, several marked trends began to form which gave the years between 1925 and 1940 a certain unity. Around the time when Schönberg wrote his first works using the 12-tone technique in 1924, when Stravinsky had gone back to Bach in his *Piano Concerto* (1923–24) and when Bartók had finished his most experimental works, the *Piano Sonata* (1926) and the *Third String Quartet* (1927), the directions became defined. Composers felt that the previous inventions needed to be explored. At this time a number of excellent neoclassicists appeared: Sergei Prokofiev before he returned to soviet Russia, Darius Milhaud (1892–), Francis Poulenc (1899–), George Auric (1899–), who followed the new aesthetic using elements of their native French popular, folk and art music, while Arthur Honegger (1892–) combined this idea with a dramatic violence that brought him close to the romantic style. In Germany, where Busoni had prepared the way, Paul Hindemith (1895–) turned from romanticism in his clear-sounding, objective, contrapuntal style and treated chromatic elements in a new motoristic, vigorously rhythmic way derived from the neoclassic approach. His series of outstanding works revealed a growing preoccupation with the styles of the Renaissance and middle ages. In the United States, Walter Piston (1894–) and Roger Sessions (1896–) produced important and skilful works in this style. Shunning romantic attitudes, they regarded themselves as returning to the ideals of craftsmanship of earlier times. Many wrote teaching pieces and music for amateurs and other kinds of *gebrauchsmusik* (music for use) in their own idioms.

The other important rallying point, atonalism, for a time eclipsed by the success of the neoclassicists, was also related to the earlier techniques, particularly of the Renaissance. Schönberg and his followers, Alban Berg (1885–1935) and Anton Webern, developed a rigorous system usually called the 12-tone or dodecaphonic technique which they applied to their subsequent works. By this an entire composition is organized around a chosen order of the 12 tones of the chromatic scale, sometimes transposed, inverted or read in retrograde motion (backward). No tone can return unless separated by the other intermediate 11 tones, thus ensuring an equal distribution of emphasis on all 12. This was intended to obviate the classical feeling of tonality. The chosen "row" of 12 tones forms the basis of all melodies, counterpoints and harmonies in a given work, and its application immediately gives stylistic and motivic unity. Alban Berg's amazing feat of composing a full-length opera, *Lulu,* on one tone row revealed the enormous possibility of variety within the system, borne out by the numerous and varied works of Schönberg and Webern. Berg's music, surprisingly enough, is also quite clearly romantic in its feeling, while Schönberg's is more austere and Webern's fancifully aphoristic. Around 1940, many composers like the former neoclassicist, Ernst Křenek (1900–), and the young Italian, Luigi Dallapiccola (1904–), began to use this system as did many others in most important musical centres. It also had an indirect influence on Bartók and on the Americans, Sessions and Wallingford Riegger (1885–).

A mature form of nationalism that aimed at expressing the national spirit of a country in music abstracted from its folk origins emerged in almost every country during these years. The outstanding exponents of this trend were: Bartók and Zoltán Kodály (1882–) in Hungary; Manuel de Falla (1876–1946) in Spain; Ralph Vaughan Williams (1872–) and Gustav Holst (1874–1934) in England; Bohuslav Martinu (1890–) in Czechoslovakia; Gian Francesco Malipiero (1882–) in Italy; Heitor Villa-Lobos (1881–) in Brazil; Carlos Chavez (1899–) and Silvestre Revueltas (1899–1940) in Mexico; and Roy Harris (1898–), Aaron Copland (1900–), Douglas Moore (1893–) and the independent experimenter, Charles Ives (1874–), in the United States. Since all of these and many more applied in some measure the principles of stylization mentioned above, their works present a most varied character.

For sensitivity to stylistic differences had been very strongly developed as musicians came to know recordings of folk, primitive and oriental music, as well as pre-18th century music as it was occasionally performed under the supervision of musicologists intent on reviving the original music with its original style of interpretation. This expanded cultural and historical horizon, as was seen above, contributed new stylistic and aesthetic ideas to many 20th-century composers, some of whom, such as Bartók, Hindemith and Křenek, were musicologists themselves.

It is beyond the scope of this article to discuss in detail the psychological and sociological background of modern music. One characteristic feature deserves mention, however—the role of the societies which were formed in almost every occidental country to encourage and propagate the new music. Many composers took a determined stand against the banalities of the contemporary popular mass culture and relied on the understanding and support of such intelligent and progressive groups of musicians and music lovers to serve as intermediaries between them and the broad musical public. This reaction against the widespread public trend toward cultural uniformity (which in the musical world showed itself in the standardization of the repertoire) led many musicians to the cultivation of pronounced individuality of style. It also led them to uphold the integrity and dignity of modern art by assuming more meaningful attitudes toward artistic expression and toward contemporary life than were possible in popular entertainments or in the general run of concerts devoted to the repetition of familiar masterpieces. Hence modern music was often misunderstood by the general musical public, while the societies which supported modern music were able to distinguish its importance. The faith of these societies over the years was amply justified by the remarkable works which they brought to light and championed.

MUSIC, TEACHING OF. Music is concerned with three types of individuals—composers, performers and listeners. The basic training of all three is related, since none can function fully without an understanding of musical structure. Hence the teaching of music is essentially the development of musicianship—that is, the sum of individual aptitudes, insights and skills in respect to music. Musicianship consists of both intuitive and rational responses, and the teacher's responsibility is to develop the latter through all available means according to the student's individual needs and capabilities. Musicianship is based primarily upon a grasp of how composers use their materials, and hence the greatest teacher of music, either technically or aesthetically, is music itself. But, as Franz Joseph Haydn said, "The educated ear is the sole authority," and this simple fact is the basis of the teaching of music in terms of musicianship.

Listening, as the primary type of musical activity, is transmuted into specific skills through singing, playing, analyzing, writing and creating music. These avenues of learning all have a common goal—musical insight, which is promoted by their integration. Specifically, this means that the student learns the structure of music through the simultaneous study of written and keyboard harmony, music reading, ear training, analysis and creative writing. All are of equal importance, and all contribute to "the educated ear." These, then, are the basic principles of the teaching of music: the development of musicianship through the study of music literature based upon aural perception and promoted through related and integrated skills. The teaching of these skills may be summarized thus:

Listening is a mental activity dependent only in a general sense on physical hearing. Hence "ear training" should be regarded as directed listening for all rather than as a separate skill for the select few. It may be either oral or written, and its precision will depend upon the maturity of the student and the end in view. The first aural reactions will be general in character: the recognition of register, tones of the tonic chord, consonance and dissonance. These generalities will gradually be refined to specific reactions: chord quality, inversions, form and rhythmic, melodic and harmonic complexities, paralleling the development of other skills. In general, the musical passages used should be presented as a unit, not as separate rhythmic, melodic or harmonic drills, even though each of these factors may be recognized individually. Three specialized types of dictation should be noted: (1) corrective listening—the recognition of differences between the music as printed and as performed when the instructor deliberately introduces alterations; (2) contrapuntal listening—notation of simple two-voice counterpoint; and (3) analytic listening—recognition and notation of formal design, using letters for various parts and arbitrary symbols for cadences.

Writing is one aspect of musical literacy and as such is an essential skill. In the beginning, notation is best learned directly from the analysis of familiar melodies, not as an isolated body of facts unrelated to musical experience. When the elements of notation are learned, the study of harmony is begun, and scale structure, key signatures, intervals and chords are explained as the need arises from the music examined. Four-part harmony is approached gradually through one-, two-, and three-voice writing and simple piano accompaniments. Chords are best taught in the order of their use in music literature rather than in the order of their structure; *i.e.,* triads, their inversions, seventh chords, etc. Musical usage implies the early introduction of nonchord tones and modulations. Figured bass assumes less importance, though its principles should be clearly understood. Counterpoint is studied stylistically through the vocal and instrumental idioms of Giovanni Pierluigi da Palestrina and Johann Sebastian Bach respectively. The traditional approach, strict or academic counterpoint, is less desirable, as its musical values occur unrestricted in Palestrina's style.

Keyboard Harmony makes abstract knowledge concrete. It includes melody harmonization, transposition, improvisation, modulation, score reading, harmonic reductions, keyboard dictation and playing by ear. From the beginning all students should have some keyboard experience, limited only by their technical facility. Two advanced specialized types of keyboard instruction should be noted: (1) the teaching of transposition through the use of movable clefs and (2) keyboard analysis of piano literature for interpretive purposes.

Music Reading, as the other aspect of musical literacy, is equally important. The immediate purpose of music reading or "sight singing" is dual: to read music silently and to reproduce it vocally. The training of the inner ear takes precedence, because vocal reproduction is the echo of the sound conceived mentally. Hearing precedes singing. All systems for developing a sense of pitch relationship are only means to that end and should be abandoned when it is achieved. The oldest system, solfeggio and its modification, tonic sol-fa, associated the first syllable of each line of a medieval hymn to John the Baptist with one of the six degrees of the Guidonian hexachord (*q.v.*). Its long use is due as much to tradition as to the success of the system. However, it is open to criticism on both psychological and pedagogical grounds. In America, three other systems are found: (1) the use of numbers or letters, or both, for scale pitches, (2) the development through rote singing and melodic analysis of a strong sense of tonality without the use of specific pitch names and (3) the supplementary use of a simple flutelike instrument to solve physical or psychological problems. Without evaluating these various methods, it is clear that they all are only teaching devices to aid in vocal discrimination. The whole problem of music reading is complex and includes many psychological and musical factors. The solution requires a thorough study similar to that done in the field of language. Certainly it is known that one of the essential principles is phrase-wise rather than note-wise reading, and, in general, emphasis on the musical rather than the technical elements involved.

Analysis is an understanding of the total organization of music. Its objective is the explanation of musical structure in such a way that insight results. It includes awareness of all harmonic, contrapuntal, formal and stylistic elements. In a sense, all musical activity is dependent upon either conscious or intuitive analysis, and for this reason it should permeate all levels of instruction. Even a child can understand, in his own terms, the organization of music that he performs. In harmonic analysis it is desirable to stress essential progressions rather than details; *e.g.*, chromatic embellishing chords or diatonic extensions, which can be fitted later into the general pattern. Contrapuntal analysis, especially of the baroque period, is of particular value to pianists, organists or choirmasters.

The analysis of form, or the sequence of musical ideas, is also essential for musicianship and yet is frequently neglected. The first principle of teaching form is to explain the structure in simple language understood by the student. Second, analysis must be applicable to the student's needs and relative to his experience. Third, it should be both aural and visual, though analysis by ear is a much more musical and realistic approach. Both can be combined by reading the music while listening to its performance.

Creative Writing is one of the best means for the promotion of musical insights. Creativity is universal and should be used from the outset according to individual capacity. Begin by setting short poems to music without accompaniment, or by writing free instrumental melodies, and parallel later study by composition in the small-song forms. Students, even with a meagre background, can express themselves acceptably when musical rather than technical problems are stressed. The objective is musical growth through doing, and this can be achieved on all levels.

These six skills, then, as the basis of musicianship, should be so taught as to meet the individual needs of composers, performers and listeners.

Trends.—At mid-20th century, some specific trends in music teaching were: (1) emphasis on musicianship as the goal, achieved through the study of musical literature. This implied a consideration of style as a factor of structure and consequently as a basis of judgment; *e.g.*, the different attitude toward parallel fifths in various periods. Another implication was the stress on musical rather than technical values, the recognition of general principles rather than of specific rules. Thus, if the trained ear was to be the only arbiter, a passage could not be poor musically but correct theoretically. This involved the question of taste—also an essential element of musicianship. (2) Use and integration of all avenues of learning discussed above, rather than the traditional emphasis on reading and writing. This meant that ear training, keyboard harmony, analysis and creative writing were also treated as integral and integrative factors in the development of musicianship.

General trends in the teaching of music were: (1) belief in the social and democratic values of music, and of its vital role in the well-rounded curriculum at all levels of instruction, as shown by the expanding instrumental and vocal programs in primary and secondary schools, and colleges. (2) Use of audiovisual aids enlarged and improved tremendously the techniques of both group and individual study through the use of radio, records and scores for the exploration of musical literature in accordance with the principles outlined above. (3) Growth of the adult education movement increased both the number and type of music students. Instruction of these amateur groups emphasized the cultural rather than the technical aspects of music, unless the latter were required for individual needs. (4) Remarkable development of musicology, especially in America, where outstanding European authorities had settled from 1914 onward, thereby stimulating its study.

UNITED STATES

Music received slight attention in the days of the American colonists. For the improvement of church music, manuals of instruction in singing were prepared early in the 18th century by two Massachusetts ministers, the Rev. John Tufts and the Rev. Thomas Walter. These books and their successors provided the text material for the "singing schools" and "musical conventions" which for years represented the chief activity in music study.

The first well-organized effort to provide a more complete musical education was the Boston Academy of Music founded by Lowell Mason in 1833. The first college recognition of music was the engagement of an instructor of music at Oberlin college, Oberlin, O., in 1838. From about 1840 a considerable number of Americans went abroad to study music, chiefly in Germany. These pioneers, home again and reinforced by many foreigners, were leaders in the marked advance of their profession, especially after the Civil War. The first comprehensive music schools were the Oberlin conservatory (1865), which in 1867 became the first college music department, and the New England conservatory (Boston, Mass., 1867). Then followed the Cincinnati conservatory (Cincinnati, O., 1867), Chicago Musical college (Chicago, Ill., 1867), Peabody conservatory (Baltimore, Md., 1868), College of Music in Cincinnati (1878), American conservatory (Chicago, Ill., 1886) and many others.

Reporting in 1908 on a study of such schools and departments of music, the bureau of education declared that their widely varying curricula in many instances were so much given to the vocational aspects of music that music was separated from general educational thought. Data in Randall Thompson's *College Music* (1935) were indicative, however, of academically well-based curricula, though varied in extent and other respects, at Oberlin by 1865, Harvard by 1870, and Smith, Vassar, Wellesley, Yale, Columbia and the Universities of Michigan and Oregon between then and the turn of the century. The Music Teachers National association (1876), comprised of teachers and, later, composers, conductors, musicologists, editors, critics, music librarians and publishers, became increasingly a disseminator of broadly educational ideas as to music teaching. Also directly effective in the improvement of many music schools and departments was the National Association of Schools of Music, founded in 1924 to develop uniform standards for granting degrees and other credentials. Efforts were made in some states to set standards for the work of private music teachers, but with only partial success.

Four music schools with large endowments became especially competent to give the highest professional training, often through

scholarships. The oldest, the Institute of Musical Art of New York, was founded in 1904 and in 1926 became affiliated with the Juilliard School of Music as its undergraduate school. The large bequest of Augustus D. Juilliard (1919) for musical education led to founding in 1924 of the above-named graduate school for students of unusual talent. The Eastman School of Music (1919), a department of the University of Rochester (N.Y.), was endowed with $12,000,000 by George Eastman, and the Curtis Institute of Music in Philadelphia (Pa., 1924) with more than $12,000,000 by Mrs. Edward W. Bok. Sharing the Boston Symphony orchestra's ideal setting at Tanglewood was the Berkshire Music centre, established by Serge Koussevitzky in 1940 in connection with the Berkshire festivals. Two classes of students were admitted to this great summer centre: those capable of profiting by the best professional training for careers as orchestra or solo players, singers, conductors or composers; and "students, teachers and others . . . seeking to enrich their capacities for life-long enjoyment." Tanglewood was given to the orchestra in 1936 by Mrs. Andrew H. Hepburn and Mary A. Tappan. A bounty of another kind was the settling in the United States of many more of the world's finest musicians and teachers shortly before and during the period of World War II.

Public school music education in the United States began with Lowell Mason's work in the Boston public schools in 1837, an example followed promptly in Buffalo, N.Y., Pittsburgh, Pa., Louisville, Ky., Cincinnati, O., San Francisco, Calif., and other communities. The Music Educators National conference was founded in 1907 by school music supervisors. Largely through that organization, with its affiliated regional, state and local associations, research council, active committees on every phase of the work, and its journal and other publications, the teaching of music in schools had by the mid-century become almost everywhere a cherished indispensable. The brief summer schools for music teachers of the early days were succeeded by special four-year curricula and graduate courses at state and other universities and some conservatories. There were still many school systems with very little or poor music instruction, some with none, but many high schools had developed excellent performing groups and music courses, while guided listening, rhythmics, class instrumental instruction and playing groups as well as singing had become common in elementary schools. Two of the greatest events for music teachers in the first half of the 20th century were the amazingly good performance of the *Eroica* symphony by a large national high school orchestra at the Music Educators National conference in Detroit, Mich., in 1926 and the superb performance of great music by a Flint (Mich.) high school *a cappella* choir at the Chicago meeting of that conference in 1928. The challenge of these revelations was felt throughout the nation.

The first music textbooks, by Lowell Mason (1841) and Charles Aiken (about 1850), were for grammar grades and high school and were derived from those of the "singing schools." The *National Music Course* (Luther W. Mason, 1870) was the first to provide distinctively for all grades. It was used widely in the U.S., and a translation published in Leipzig was used in German schools; but by 1880 its abundance of songs and the teaching of music reading mainly through them came under suspicion of not helping directly enough toward mastery of the printed page. Moreover, where accepted as a regular part of school work, music had now to prove not its appeal and human value, but that it could be taught efficiently by the grade teacher. The *Normal Music Course* (1883) gave answer in a relentlessly logical succession of exercises and songs. This won many adherents, but its use gradually revealed that mastery of details of scale and rhythm, won apart from music, was of little use in reading music. By mid-20th century 16 other complete music courses had been published and widely adopted, all using the song approach to musical learning, but many with large quantities of inane songs. The trend, however, was toward using many folk songs and other vital music and toward greater dependence, as to method, on the musicalness, judgment and skill of the teacher.

MUSICAL-BOX. The modern musical-box is an elaboration of the elegant toy musical snuffbox in vogue during the 18th century. The notes or musical sounds are produced by the vibration of steel teeth or springs cut in a comb or flat plate of steel, reinforced by the harmonics generated in the solid steel back of the comb. The teeth are acted upon and musical vibrations produced by the revolution of a brass cylinder studded with projecting pins, which, as they move round, raise and release the proper teeth at due intervals according to the nature of the music. The revolving motion of the cylinder is effected by a spring and clockwork, and the rate is governed by a fly regulator.

MUSICAL COMEDY. Until the end of the 19th century, the term "musical comedy" was one of many used to describe any stage piece of a comic nature to which music was either integral or incidental. Within this loose usage, an *opera buffa* such as Mozart's *Le Nozze di Figaro* could be called a musical comedy; at an opposite extreme of the artistic gamut, the popular U.S. farces written and staged by Charles Hoyt in the late 19th century were sometimes referred to as musical comedies, on the strength of their interpolated songs and ballads.

A more specific application of the term, to a genre of stage piece in which popular songs, dances, and production ensembles are festooned upon or related to a comic or farcical plot, was first made in the early 1890s by George Edwardes, manager of the Gaiety theatre in London, who called his productions *In Town* and *A Gaiety Girl* musical comedies in order to distinguish them from the burlesques he had previously presented. These musical comedies were brought from the Gaiety to the United States, where, as in England, they were archetypes of a form of entertainment that persisted.

Musical comedy, as it has been known in the 20th-century U.S. and English theatres, differs from comic opera and operetta in adhering to a more vernacular style in its music, dances, lyrics and dialogue. It differs from variety, or vaudeville—to which it is indebted for many of its elements of song, dance, and humour—in its possession of a plot (however minimal), and also, as a rule, in the elaborateness (and frequently the tastefulness) of its investiture and mode of presentation. It differs from the revue not only in its employment of a plot, but also in its lack of dependence upon satire, parody and topical thrusts—though satire often is a component of musical comedy.

U.S. musical comedy, as it came into being just before the beginning of the 20th century, developed through a fusion of elements from six earlier types of musical entertainment—extravaganza, pantomime, variety, burlesque, farce-comedy (in the special sense the term acquired in the 1870s) and European comic opera. The extravaganza (in France, the *féerie*) was originally an imaginative spectacle leaning upon the devices of ballet; *The Black Crook* (1866) was a celebrated example in the United States.

After French romantic ballet dropped out of favour, almost any spectacular piece employing elaborate machinery for the production of illusions and tricks was called an extravaganza. Pantomime, still extant in England, was a short-lived importation in the United States, disappearing in the 1870s. Its most significant remnant in musical comedy is the technique of "mugging," or making humorous contortions of the face. Variety served as a proving ground for performers who later graduated into musical comedy; many songs and dance routines (including those from the blackface variety entertainments known as minstrel shows) became stock in trade of musical comedy.

Burlesque, before its decay into mere pruriency, was taken to the United States in 1868 by Lydia Thompson of London, and given a homely U.S. cast by Edward E. Rice in *Evangeline* in 1874. Among the distinguishing marks of burlesque in the 19th century were its girls in tights, playing what purported to be masculine roles, its male comedians with baggy pants and red noses and its punning humour. Farce-comedy, devised in the middle

1870s by the Vokes family of England and an American troupe called Salsbury's Troubadours, introduced the notion of hanging an array of variety specialties upon a slender thread of plot. These vernacular forms of entertainment stood in contrast to English and Viennese comic opera and French *opéra bouffe*, which at best constituted a more aristocratic genre, and elicited the contributions of the best craftsmen in the light musical field.

Borrowing from all these sources, U.S. musical comedy began a growth. In the second decade of the 20th century, ballroom dancing (as expounded by Vernon and Irene Castle) and ragtime music (particularly that of Irving Berlin) moved musical comedy largely out of the comic-opera world of imaginary Balkan principalities, princes and Cinderella heroines. In the 1920s, as the impact of Max Reinhardt's innovations in staging, Joseph Urban's rich *décors*, and the experiments of the "new theatre" began to be felt, the artistic level of musical comedy rose considerably. In the depression years of the early 1930s, political satire invaded musical comedy, and *Of Thee I Sing* became the first piece of the kind to win the Pulitzer prize. In the late 1930s and early 1940s such choreographers as George Balanchine and Agnes De Mille won for the dance a more serious participation than it had enjoyed before; and musical comedy began to be conceived of as a coherent lyric-theatre form, embodying co-operative contributions of music, dance, book, lyrics, action, costumes, stage settings and lighting. A series of "intimate" musical comedies by Jerome Kern, Guy Bolton and P. G. Wodehouse, initiated with *Very Good, Eddie* at the Princess theatre in New York in 1915, created a public demand for believable plot construction and characterization which grew consistently, and such dramatically superior works as *Lady in the Dark* and *South Pacific* were the result. U.S. musical comedy shared more and more the Broadway field with serious and even tragic "musical plays," such as Gian-Carlo Menotti's *The Consul*. These, however, were undertakings of a quasi-operatic nature, unlikely to displace the blither and less exacting genre of musical comedy. (C. M. S.)

MUSICAL INSTRUMENTS, MECHANICAL. (*See* BARREL-ORGAN; MUSICAL-BOX; GRAMOPHONE; PLAYER-PIANO.)

MUSICAL NOTATION, a graphic method of representing sounds to the ear through the medium of the eye. It is probable that the earliest attempts at notation were made by the Hindus and Chinese, from whom the principle was transferred to Greece. The exact nature of the Greek notation is a subject of dispute, different explanations assigning 1680, 1620, 990, or 138 signs to their alphabetical method of delineation. To Anicus Manlius Severinus Boethius we owe the certainty that the Greek notation was not adopted by the Latins, although it is not certain whether he was the first to apply the 15 letters of the Roman alphabet to the scale of sounds included within the two octaves, or whether he was only the first to make record of that application.

Indications of a scheme of notation based, not on the alphabet, but on the use of dashes, hooks, curves, dots and strokes are found to exist as early as the 6th century, while specimens in illustration of this different method do not appear until the 8th. The origin of these signs, known as neumes (*q.v.*) (*νεύματα*, or nods) is the full stop (*punctus*), the comma (*virga*), and the mound or undulating line (*clivus*), the first indicating a short sound, the second a long sound, and the third a group of two notes. The musical intervals were suggested by the distance of these signs from the words of the text. The variety of neumes employed at different times, and the fluctuations due to handwriting, have made them extremely difficult to decipher. In the 10th century a marked advance is shown by the use of a red line traced horizontally above the text to give the singer a fixed note (F = fa), thus helping him to approximate the intervals. To this was added a second line in yellow (for C=ut), and finally a staff arose from the further addition of two black lines over these.

A variety of experiments resulted in the assignment of the four-lined staff to sacred music and of the five-lined staff to secular music. The yellow and red colours were replaced by the use of the letters F and C (fa and ut) on the lines. This use of letters to indicate clef (*q.v.*) is forestalled in a manuscript of Guido of Arezzo's *Micrologus*, dating from the 12th century, in which is the famous hymn to St. John, printed with neumes on a staff of three lines (*see* GUIDO OF AREZZO and HEXACHORD). The use of letters for indicating clefs has survived to the present day, our clef signatures being modified forms of the letters C, F and G, which have passed through a multitude of shapes.

Before the 12th century there is no trace of a measured notation; *i.e.*, of a numerical time division separating the component parts of a piece of music. It was at the time of Franco of Cologne that measured music took its rise, together with the black notation in place of neumes, which disappeared altogether by the end of the 14th century. In the black notation, which led to the modern system, the square note with a tail (▀▌) is the long sound; the square note without a tail (■) is the breve; and the lozenge shape (♦) is the semibreve. In a later development there were added the double long ▬▌ and the minim (♦). The breve, according to Franco of Cologne, was the unit of measure.

The development of a fixed time division was further continued by Philippe de Vitry. It has been noted with well-founded astonishment that at this period double time (*i.e.*, two to the bar) was unknown, but only triple time which was regarded as "perfect"—"because it hath its name from the Blessed Trinity which is pure and true perfection." Vitry championed the rights of imperfect time and invented signs to distinguish the two. The perfect circle ○ represented the perfect or triple time; the half circle C the imperfect or double-time. This C has survived in modern notation to indicate four-time, which is twice double-time; when crossed ₵ it means double-time. The method of dividing into perfect and imperfect was described as prolation. The addition of a point to the circle or semicircle (⊙ Ͼ) indicated major prolation; its absence, minor prolation. The substitution of white for black notation began with the first year of the 14th century and was fully established in the 15th century.

It has already been shown how the earlier form of alphabetical notation was gradually superseded by one based on the attempt to represent the relative height and depth of sounds graphically. The alphabetical nomenclature, however, became inextricably associated with the graphic system. The two conceptions reinforced each other; and from the hexachordal scale, endowed with the solmization of *ut, re, mi, fa, sol, la*—which was a device for identifying notes by their names when talked of, rather than by their positions when seen on a page of music—arose the use of what are now known as accidentals (*q.v.*).

Of these it may here be said that the flat had originated from the necessity of sinking the B of the scale in order to form a hexachord on the note F in such a way as to cause the semitone to fall in the right place—which in the case of all hexachords was between the third and fourth notes. This softened B was written in a rounded form thus: ♭ (*rotundum*), while the original B remained square thus: ♮ (*quadrum*). The original conception of the sharp (*q.v.*) was to cross or lattice the square B, by which it was shown that it was neither to be softened nor to remain unchanged. The flat, which originated in the 10th century, appears to have been of far earlier date than the sharp, the invention of which has been ascribed to Josquin Des Près (1450–1521). The B-sharp was called B *cancellatum*, the cross being formed thus ※.

The use of key signatures constructed out of these signs of sharp and flat was of comparatively late introduction. The key signature states at the beginning of a piece of music the sharps and flats which it contains within the scale in which it is written. It is a device to avoid repeating the sign of sharp and flat with every fresh occasion of their occurring. The double ♭♭ and the double sharp χ are conventions of a much later date, called into existence by the demands of modern music, while the sign of the natural (♮) is the outcome of the original B quadration or square B♮. (*See* TONIC SOL-FA and CHEVÉ SYSTEM.)

MUSIC PRINTING. Printed music originated soon after the invention of typography and the year 1465 is given as the earliest date of any record of its existence. At first the method was only used for printing the staves in red ink from a woodcut, the notes being written in by hand. Later the staves and notes were engraved separately on wood blocks and printed respectively in red and black. Then followed the practice of cutting both the staves and notes on one block for printing in black. There are no records of music being printed from separate characters before 1473 when a theological work by a German printer named Gerson was issued containing five notes of music evidently so printed. This may be regarded as the foundation of music printing.

In 1482 William Caxton, the first English printer, published a work entitled *Polychronicon,* in which there are a few notes of music, though apparently filled in to the printed stave lines by hand. Wynkyn de Worde, who succeeded Caxton, reprinted this work in 1495, introducing both the notes and stave lines by type characters, so that he must be given the credit of being the first English printer of music from movable type. The *Mainz Psalter* of 1490 contained typeprinted music. In 1500 Ottaviano Petrucci, in Venice, produced music with the staves and notes printed from type by separate operations.

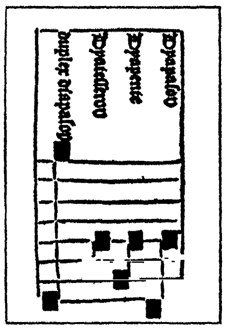
Thenceforward the system of printing the stave lines separately fell into disuse. Pierre Attaignat, in Paris (1529), was the first to print the words of songs under the notes. In 1530 music began to be printed in England with type similar to that used by Petrucci, and it was done in two printings, but in 1539 a London printer named Gough issued music from type characters with the staves and notes printed at one impression. In 1550 Richard Grafton printed in London the *Booke of Common Praier noted,* the musical part being executed in type with red stave lines. Printing from type then became general and by 1700 it had assumed the appearance of present day music.

Music printed from plates dates from 1525, when Pierre Hautin, a French engraver, cut punches for the notes and stamped them into metal plates, which were finished by engraving. This style of work became general in England and continued to hold the field until about 1710, when music printed from punched plates began to appear.

Lithographic music printing dates from 1799, being first applied by Alois Senefelder, the inventor of lithography, who drew the music direct on stone, or on transfer paper.

Typographical music printing recovered its position with the production of better music type by the English letter-founders and came largely into use for hymnals, song books, and other musical works for which large editions in a cheap form are required.

The work of setting up music type is however very tedious as the staves and notes have to be built up from a large number of small pieces. A font may contain from 400 to 500 characters. Most music printing, at least for sheet music, orchestral parts, etc., is done by lithography, the original plates being made partly by punching and partly by engraving on pewter.



FROM THE "POLYCHRONICON," PRINTED BY WYNKYN DE WORDE

SPECIMEN OF THE EARLIEST EXAMPLE OF TYPE-PRINTED MUSIC

The method of engraving starts with ruling the staves on the plate with a five-pointed rakelike tool, called a "score"; then the spacing between the notes (previously determined by marking-off the manuscript) is set out by a method called "pointing," which is done with a small compass. The character of the notes and their position on the stave are roughly indicated on the plate with a blunt steel point called a "marking pin." During the punching the plate is laid on a stone slab and the punches are held in contact with the plate while a smart blow is given with a steel mallet. A set of punches usually consists of 50 to 53 pieces as a rule. Only the heads of the notes are punched, the hooks, ties, etc., being finished by gravers and other engraving tools. All the usual signs are punched and the words of songs are filled in with letter punches. Photo-lithography has been largely used for reproducing out-of-print music, the plates of which have been destroyed. Collotype has been found very effective in reproducing old music in *facsimile.*

MUSK, the name originally given to a perfume obtained from the strong-smelling substance secreted in a gland by the musk deer (*q.v.*), and hence applied to other animals, and also to plants, possessing a similar odour. The variety which appears in commerce is a secretion of the musk deer; but the odour is also emitted by the musk ox and muskrat of India and Europe, by the musk duck (*Biziura lobata*) of West Australia, the musk shrew, the musk beetle (*Calichroma moschata*), the alligator of Central America, and others.

To obtain the perfume from the musk deer the animal is killed and the gland completely removed, and dried, either in the sun, on a hot stone, or by immersion in hot oil. It appears in commerce as "musk in pod," *i.e.,* the glands are entire, or as "musk in grain," in which the perfume has been extracted from its receptacle. Three kinds are recognized: (1) Tongking, Chinese or Tibetan, imported from China, the most valued; (2) Assam or Nepal, less valuable; and (3) Karbardin or Russian (Siberian), imported from central Asia by way of Russia, the least valuable and hardly admitting of adulteration. The Tongking musk is exported in small, gaudily decorated caddies with tin or lead linings, wherein the perfume is sealed down.

Good musk is of a dark purplish colour, dry, smooth and unctuous to the touch, and bitter in taste. It dissolves in boiling water to the extent of about one-half; alcohol takes up one-third of the substance, and ether and chloroform dissolve still less. A grain of musk will distinctly scent millions of cubic feet of air without any appreciable loss of weight, and its scent is not only more penetrating but more persistent than that of any other known substance. In addition to its odoriferous principle, it contains ammonia, cholesterin, fatty matter, a bitter resinous substance, and other animal principles. As a material in perfumery it is of the first importance, its powerful and enduring odour giving strength and permanency to the vegetable essences.

Artificial musk is a synthetic product, having a similar odour to natural musk. It was obtained by Baur in 1888 by condensing toluene with isobutyl bromide in the presence of aluminum chloride, and nitrating the product. It is a symtrinitro- Ψ -butyl toluene. Many preparations have been made, and the odour seems to depend upon the symmetry of the three nitro groups.

Musk in botany is *Mimulus moschatus.* (*See* Mimulus.) The musk orchis is *Herminium monorchis;* musk mallow, *Malva moschata;* muskmelon, *Cucumis melo;* musk thistle, *Carduus nutans.*

MUSK DEER (*Moschus moschiferus*), an aberrant deer, presenting many peculiar characteristics (*see* Deer). There are no antlers, but in lieu of such weapons, the upper canine teeth of the male form projecting tusks. About 20 in. high at the shoulder, the musk deer possesses long limbs, and there is a great development of the lateral pair of hoofs. The ears are large and the tail rudimentary. The grayish-brown hair is long, coarse, and brittle. This animal inhabits the forests of the Himalayas as far west as Gilgit, always at great elevations and preferring thickets of birch, juniper, and rhododendrons. It extends into Tibet, Siberia and northwestern China. In habits the musk deer is solitary, shy and nocturnal, but very active; it feeds on moss, grass and leaves. The deer takes its name from the secretion of a sac, about the size of an orange, beneath the skin of the abdomen, opening in front of the preputial aperture. This contains a dark brown substance of the consistency of "moist gingerbread." It is only present in the male (*see* Musk). A race, the southern

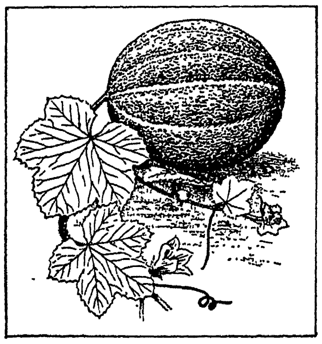
musk deer (*M. m. sifanicus*), inhabits eastern China, distinguished by its longer, black ears.

MUSKEGON, a city of western Michigan, U.S.A., on Lake Michigan, at the mouth of the Muskegon river, which expands here into a lake 5 mi. long by 1 to 5 mi. wide; a port of entry and county seat of Muskegon county. It is on federal highways 16 and 31 and is served by the Grand Trunk Western, the Pennsylvania, the Chesapeake and Ohio railways and by the Grand Trunk-Pennsylvania car ferry and boat service to Milwaukee. The population was 48,429 in 1950 and 47,697 in 1940 by federal census. Muskegon is one of four municipalities with contiguous boundaries, the others with 1950 populations, being Muskegon Heights (18,828), North Muskegon (2,424) and Roosevelt Park (1,254). Muskegon has a fine landlocked harbour, with traffic of more than 3,000,000 tons (1951). It is the centre of a summer resort region; the metropolis of a fine dairying, farming and fruit-growing district; and above all a modern industrial city, with 200 manufacturing establishments. Leading products include automobile motors and castings, aviation engines, office equipment, bowling and billiard equipment, piston rings, electric refrigerators, washers, gasoline pumps, window-shade rollers and laboratory-table equipment. The city's public parks cover 1,855 ac. and include 7 mi. of lake front. The city operates under a commission-manager form of government. A trading post was established here in 1812, and permanent settlement began in 1834. The first sawmill was built in 1837.

The town was laid out in 1849, was incorporated as a village in 1861 and chartered as a city in 1869. In 1870 the population was 6,002. The lumber industry reached its peak in 1887, with a cut of 700,000,000 bd.ft.; and the population at that time was about 24,000. With the depletion of the forests, the population dwindled. The renewed prosperity began about 1900. The name Muskegon is probably derived from a Chippewa word meaning "grassy bog."

MUSKET, the term generally applied to the firearm of the infantry soldier from about 1550 up to and even beyond the universal adoption of rifled small arms about 1850–60. The word originally signified a male sparrowhawk (Italian *moschetto,* derived perhaps ultimately from Latin *musca,* a fly) and its application to the weapon may be explained by the practice of naming firearms after birds and beasts (*cf.* falcon, basilisk). The "musket" proper, introduced into the Spanish army by the duke of Alva, was much heavier and more powerful than the arquebus. Its bullet retained sufficient striking energy to stop a horse at 500 and 600 yd. from the muzzle. A writer in 1598 (quoted *s.v.* in the *Oxford English Dictionary*) goes so far as to say that "One good musket may be accounted for two callivers." Unlike the arquebus, it was fired from a rest, which the "musketeer" stuck into the ground in front of him. But during the 17th century the musket in use was so far improved that the rest could be dispensed with. The musket was a matchlock, weapons with other forms of lock being distinguished as wheellocks, firelocks, snaphances, etc., and soldiers were similarly distinguished as musketeers and fusiliers. On the disuse, about 1690–95, of this form of firing mechanism, the term "musket" was, in France at least, for a time discontinued in favour of "fusil," or flintlock, which thenceforward reigned supreme up to the introduction of a practicable percussion lock about 1830–40. But the term "musket" survived the thing it originally represented, and was currently used for the firelock (and afterwards for the percussion weapon). Today it is generally used for military firearms anterior to the modern rifle. The original meaning of the word *musketry* has remained almost unaltered since 1600; it signifies the fire of infantry small-arms (though for this "rifle-fire" is now a far more usual term), and in particular the technique of using them (*see* INFANTRY and SMALL ARMS, THE DEVELOPMENT OF). A *musketoon* was a short, large-bore musket somewhat of the blunderbuss type, originally designed for cavalry use, but in the 18th century chiefly a domestic or coachman's weapon.

MUSKMELON, *Cucumis melo,* a polymorphic species of the family Cucurbitaceae, including numerous varieties. The muskmelon is a tender annual trailing herb with palmately-lobed leaves, and bears tendrils by means of which it is readily trained over trellises. It is monoecious, having male, female, and, in some varieties, complete flowers on the same plant; the yellow flowers have deeply five-lobed campanulate corollas and three stamens. It is a native of south Asia "from the foot of the Himalayas to Cape Comorin" (*see* Charles Naudin, *Annales des sciences naturelles,* vol. 4 [1859]), where it grows spontaneously, but is cultivated in the temperate and warm regions of the whole world. It is variable both in diversity of foliage and habit, but much more so in the fruit, which in some varieties is no larger than an olive, while in others it rivals the squash (*Cucurbita maxima*). The fruit is globular, ovoid, spindle-shaped, or serpent-like, netted or smooth-skinned, ribbed or furrowed, variously coloured externally, with white, green or orange flesh when ripe, scented or scentless, sweet or insipid, bitter or even nauseous.



J. HORACE MCFARLAND COMPANY

MUSKMELON (CUCUMIS MELO)

Like the squash and pumpkin the melon undergoes strange metamorphoses by crossing its varieties, though the varieties preserve their characters when alone. The offspring of all intervariety crosses within the species are fertile.

Naudin thought it probable that the culture of the melon in Asia is as ancient as that of all other alimentary vegetables. The Egyptians grew it, or at least inferior races of melon, which were either indigenous or introduced from Asia. The Romans and doubtless the Greeks were familiar with it, though some forms may have been described as cucumbers. The melon began to be extensively cultivated in France in 1629, according to Olivier de Serres. Gerard (*Herball,* 772) figured and described in 1697 several kinds of melons or pompions, but he included gourds under the same name. The region of origin of some modern types, such as "cantaloups," "Dudaim," "Cassaba" and probably the netted or nutmeg sorts, is believed to be Persia and the neighbouring west Asian regions. The first of these was brought to Rome from Armenia in the 16th century, and supplies the chief sorts grown for French markets; but many others are doubtless artificial productions of west Europe.

In the coolest parts of the temperate zones muskmelons, like cucumbers, can be grown to perfection only under glass. In Great Britain and northern Europe the rock and cantaloup types may be grown with a soil temperature of 70° F. and an air temperature of 75° to 80° in the sun; the Persian varieties require temperatures about 5° higher, and will tolerate 90° or more in the sun. Most varieties are subject to many diseases, control of which is aided by keeping the air humidity relatively low. Muskmelons grow well on many soil types but require high fertility and ample soil moisture and respond well to heavy applications of manure.

In the United States and in the warmer parts of the temperate zones, muskmelons are grown very extensively in the field. The plants are usually spaced about 2 ft. apart in rows 5 ft. apart or in hills 5 x 5 ft. apart. Some of the earliest plantings are protected by windbreaks of brush and paper or by individual plant covers of paper until warm weather arrives. Plants are sometimes started in pots in hotbeds or greenhouses, then set in the field when danger of frost is past. Since muskmelons are favoured by a relatively dry atmosphere they are especially adapted to growing in the irrigated valleys of western and southwestern United States. Plant breeders developed a number of varieties resistant to one or more forms of powdery mildew, a disease that nearly destroyed the muskmelon industry of the Imperial valley in California. In greenhouse culture, the flowers must be hand-pollinated, or hives of bees established inside the houses to effect pollination. The fruits must be supported in slings since the trellised vines are not strong enough to carry them. (V. R. B.)

MUSKOGEE, a city of eastern Oklahoma, U.S.A., 130 mi. E.N.E. of Oklahoma City, near the confluence of the Verdigris, the Grand and the Arkansas rivers; county seat of Muskogee county. It is on federal highways 62, 64 and 69, and is served by two commercial air lines, by the Missouri-Kansas-Texas, the Frisco, the Kansas-Oklahoma & Gulf, the Midland Valley and the Missouri Pacific railways and by motor carriers. Pop. (1950) 37,289; (1940) 32,332 (20.4% Negro).

Muskogee is the location of a U.S. Veterans' hospital (general medical and surgical) and the regional offices of the U.S. Veterans' administration. Here also are located the Oklahoma School for the Blind, the U.S. Indian Agency for the Five Civilized Tribes and the Oklahoma Free State fair. Two miles N.E., is Bacone college (Baptist, 1884), only fully accredited college for Indians in the U.S. Muskogee is the metropolis of a rich agricultural and oil-producing territory. It has large railway shops, yards and offices; wholesale and jobbing houses; cotton gins and compresses and cottonseed oil mills, and large glass-manufacturing and processing plants.

Muskogee was founded about 1870, and became the chief town of the Creek nation and the administrative centre of the former Indian territory. The first railway reached it in 1872. In 1893 the Dawes commission began to transform the tribal allotments into individual holdings.

The city was chartered in 1898, and in 1900 it had a population of 4,154. By 1910 the population was 25,278, a six-fold increase in the decade. The managerial form of government was adopted in 1920.

MUSKOGIAN INDIANS. This group constituted one of the larger speech stocks of native North America, and was typical of and dominant in the southeastern area of aboriginal culture, comprising the region from the Gulf of Mexico to Tennessee, and from the Carolinas to Louisiana. The Muskogian family comprised a series of divisions: 1, Apalachee; 2, Hitchiti, Apalachicola, etc.; 3, Alabama, Koasati, etc.; 4, Choctaw, Chickasaw, Mobile, Pensacola, etc.; 5, Tuskegee; 6, Cusabo, Yamasee and other tribes of the Georgia coast; 7, Miskogi proper. The latter formed the bulk of what was later the Creek confederacy, in which the Hitchiti and other groups were included. The Natchez and Taensa of the lower Mississippi seem to be a remote Muskogian offshoot; the Calusa and other south Floridian tribes may be. Since the middle of the 18th century the historically important tribes have been the Choctaw, Chickasaw and Creek, plus a branch of the latter, the Seminole. With the non-Muskogian Cherokee, these make up the "five civilized tribes," which for three-quarters of a century, until 1906, maintained quasi-autonomous governments in Indian territory (Oklahoma), where they had removed under the pressure of American settlement.

Ethnographically the Muskogian or Southeastern culture province included, besides the groups listed, the Chitimacha and Tunica of the lower Mississippi, the Iroquoian Cherokee, the Timucua of central Florida and, in the lower region of Georgia and Carolina, the Yuchi, the Algonkin Shawnee and various eastern Siouan tribes. All these groups were agricultural, planting maize, pumpkins, beans, cane-millet, tobacco, sometimes Jerusalem artichokes, and sunflowers. They gathered hickory nuts and wild fruits, hunted deer and, in the west, bison, and stored nut oil and bear fat. The settlements were straggling; the "town" contained a square, on which were public and religious buildings; "villages" were often outlying. The towns were autonomous and essentially constituted tribes. They united into confederacies, directed by councils; such confederacies might break up and recombine. The most successful, like those of the Creek and Choctaw, grew in population during the colonial period, largely through absorption of smaller or scattered groups. The tribes were divided into matrilineal, totemic clans; chieftainship and office were hereditary, probably in the lineage within the clan. The Natchez and some other groups had superimposed a peculiar class or caste system. Chiefs in these cases were carried in litters, enthroned on raised seats or in arbours, and accompanied in death by sacrificial followers. All the tribes were warlike and in chronic but shifting embroilment with others. They took scalps and slowly tortured prisoners to death in a frame or tied to a post in the town square. Often there was a distinction between civil and military chiefs; the towns entitled to offices of one or the other kind in a confederacy were known as peace and war, that is, white or red.

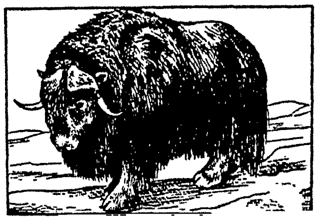
Economic life was undeveloped as compared with the fairly well organized socio-political institutions. Houses were of logs or poles, wattled, chinked or plastered with mud, the roof of thatch. Bark or thatch houses were also built. Exposed settlements were palisaded, or log forts erected. Pottery was unpainted, basketry of cane splints; simple weaving was done in bark fibres and bison hair, but the principal clothing besides mantles was breech clouts for men and apron skirts for women. Many tribes deformed their heads. There was little property, almost no treasure, and limited trade before the coming of the whites. Ritual was also simple. The most important ceremony was the busk or green-corn festival, a first-fruits and new-fire rite. Purification by emetics was a common religious observance. There was little that could be called art. Most tribes had a migration legend.

The Muskogian-Southeastern culture extended with variations north into the Ohio valley to the prehistoric moundbuilders, and northeast to the tribes of Iroquois lineage; it was represented in pallid form among many of the Algonkin groups as far as New England and the Great Lakes. The total Muskogian population was about 50,000. At the time of discovery, there may have been 7,000 Creeks (increased to 20,000 by 1832), 3,500 Chickasaw, 15,000 Choctaw, 5,000 Apalachee, perhaps 5,000 Mobile. The first three of these tribes survive in increased numbers, but much mixed with white and Negro blood.

See J. Adair, *History of the American Indians* (1775); W. Bartram, *Travels* (1791); J. Swanton, *Bur. Am. Ethn. Bull.* 43 (1911); 73 (1922); 137 (1946). (A. L. K.)

MUSK OX, an Arctic American ruminant of the family Bovidae (*q.v.*). The musk ox (*Ovibos moschatus*) is closely related to the takin of Asia and belongs in the goat-sheep subfamily. Its resemblances to the true cattle are entirely superficial. The musky odour from which the animal takes its name is not due to the secretion of a special gland, as is so often the case in mammals.

In height a bull musk ox stands about 5 ft. at the shoulder. The head is large and broad. The horns in old males have broad bases, meeting in the middle line, and covering the brow and crown of the head. They are directed at first downwards by the side of the face, and then turn upwards and forwards, ending in the same plane as the eye. In females and young males the horns are smaller, and their bases separated by a space. The ears are small, and nearly concealed in the hair. The space between the nostrils and the upper lip is covered with short hair; the rest of the animal is covered with long brown hair, thick, matted and curly on the shoulders, but elsewhere straight and hanging down, concealing the short tail. There is also a thick woolly underfur, shed in summer in blanket-like masses. The limbs are stout and short, terminating in unsymmetrical hoofs, the external being rounded, the internal pointed, and the sole in part hairy.



FROM A GROUP IN AMERICAN MUSEUM OF NATURAL HISTORY

MUSK OX (OVIBOS MOSCHATUS)

Musk oxen are confined to the northern parts of North America; they range over the "barren grounds" between lat. 64° and the shores of the Arctic sea. Northwards and eastwards they extend through the Parry Islands and Grinnell Land to north Greenland. The Greenland animal is distinguished by white hair on the forehead. Musk oxen ranged during the Pleistocene period over northern Siberia and the plains of Germany and France. They have also been found in Pleistocene gravels in England. They are gregarious, assembling in herds of 20 or 30 head, in which there are seldom more than two or three full-grown males; they run with considerable speed, but when attacked normally form a circle with the younger animals in the centre. Musk oxen feed chiefly on grass. The female brings forth one young in the end of May or beginning of June, after a gestation of nine months. The peculiar musky odour can be perceived from a distance of 100 yards. According to V. Stefansson (*The Friendly Arctic*, 1921), they are admirably suited for domestication. The flesh is excellent, the milk equal in quality to that of the domestic cow and the wool of considerable value. (J. E. HL.)

MUSKRAT or MUSQUASH, large North American ratlike

rodent, *Ondatra zibethica,* related to the voles and meadow mice and included in the subfamily Microtinae. (*See* VOLE.) It is much larger than its close relative, the European water rat, the head and body being about a foot in length and the tail but little less. It is a heavily built animal, with a broad head and short limbs; the eyes are small and the ears project little beyond the fur. The hind feet are enlarged, the five toes partly united by webs. The tail is laterally compressed, nearly naked and scaly. The hair consists of a thick soft underfur, mixed with longer stiff, glistening hairs, which overlie and partly conceal the former on the upper surface and sides. The pelage is waterproof. The colour is usually rich brown, almost black on the back, the gray of the underfur showing through on the underside. The tail and naked parts of the feet are blackish. The musky odour from which it derives its name is secreted by two large glands associated with the genital openings, present in both sexes.

U.S. DEPT. OF INTERIOR

MUSKRAT (ONDATRA ZIBETHICA)

The muskrat is found only in North America, from Alaska to Mexico. It lives in the marshes, ponds and streams, swimming and diving with great facility, feeding on roots, stems and leaves of water plants, on vegetation growing nearby, and on fresh-water mussels. Muskrats are most active at night, spending the day concealed in their burrows in the bank or in a dome-shaped house built of cat-tails, sedges and other water plants and consisting of a chamber with several passages, all opening under water. The muskrat is one of the most important fur-bearers; although individual pelts bring only a dollar or two, enormous numbers are trapped annually. Four to six young are born in the spring, in the north, but in Louisiana muskrats breed throughout the year. (*See* RODENTIA.) (J. E. HL.)

MUSK-SHREW, a name for any species of the genera *Crocidura* and *Suncus* of the family Soricidae (*see* INSECTIVORA), but generally used of the common gray musk-shrew (*S. coerulea*) of India which commonly frequents human habitations. The head and body, blue-gray in colour, measure about 6 in., and the tail is rather more than half that length.

MUSLIM: *see* ISLAM.

MUSLIN, a light cotton cloth said to have been first made at Mosul, a city of Mesopotamia. Muslins have been largely made in various parts of India, whence they were imported to England towards the end of the 17th century. Some of these Indian muslins were very fine and costly. Among the specialties are *Arni muslin,* made in the Madras presidency, and *Dacca muslin,* made at Dacca in Bengal. Muslins of many kinds are now made in Europe and America, and the name is applied to both plain and fancy cloths, and to printed calicoes of light texture. *Swiss muslin* is a light variety, woven in stripes or figures, originally made in Switzerland. *Book muslin* is made in Scotland from very fine yarns. Mulls, jaconets, lenos and other cloths exported to the east and elsewhere are sometimes described as muslins.

MUSQUASH: *see* MUSKRAT.

MUSSEL, the name given to certain aquatic bivalve molluscs of the class Lamellibranchia. In its most regular usage, it is applied to the marine Mytilidae, of which the edible mussel, *Mytilus edulis,* is the most familiar example, and to the fresh-water genus *Anodonta.* The members of the large fresh-water genus *Unio* are sometimes called mussels.

The marine mussels (*Mytilus, Modiolaria, Modiolus*) belong to the suborder Mytilacea of the order Filibranchia. The edible mussel, *Mytilus edulis,* has a wide distribution. It is found on both sides of the Atlantic and in the Mediterranean, and on the eastern Atlantic seaboard its range extends as far south as Rio de Oro in Morocco. Its habitat is towards low-tide mark, where it lives attached to rocks or on consolidated shingle or sandbanks. It is usually found in large numbers, such mussel-beds sometimes covering several acres and containing millions of individuals.

The Mytilidae have an inequilateral shell, the apex or umbo appearing to be displaced to one end when compared with that of a cockle, for example. This is due to the imperfect development of the anterior end of the shell. The foot is provided with a byssus, a bunch of hairs secreted in a glandular cavity of the foot. From this cavity the hairs are extruded and harden on contact with the sea water, forming a means of attaching the mussel to a rock or stone. This fixation is not, however, permanent; the animal can discard the byssus and anchor itself afresh in a new situation. Such a means of anchorage and the faculty of occasionally changing position are highly important in animals which live, as the Mytilidae do, in the tidal zone where gales tend to shift the sand or shingle on which they live, and where the animal is liable to be swept away from its feeding ground or buried beneath the debris of the shore.

The edible mussel, *Mytilus edulis,* is of considerable economic importance as human food and as bait for edible fishes.

M. edulis, however, is not eaten to any great extent in the United States.

It is considered of fair size for eating when it is 2 in. long, a size attained three years after the young mussel settles down. Under favourable conditions it will attain a much greater size. The degree of salinity of the water has a considerable effect on the size of the shell. For example, those mussels which live in the comparatively fresh water of the Baltic sea are often a quarter or one-fifth the size of the North sea forms. Nevertheless, it seems to thrive best in water having a salinity lower than that of normal sea water. In Great Britain the chief mussel beds are in Morecambe bay (Lancs.) and in the Wash.

There are many genera in the family Mytilidae, which has a wide distribution. They include *Modiolaria, Lithophaga* (the date mussel), which bores into rock, *Modiolus* and *Crenella.*

The fresh-water mussels are members of the family Unionidae (order Eulamellibranchia) and include the genera *Anodonta, Unio, Quadrula,* etc. They are mainly found in rivers and lakes. They burrow in the soft mud of the bottom and, living thus in more tranquil conditions than the sea-mussels, have a byssus only in the juvenile stage. The developmental history of these mussels is unique among molluscs, as the young larva (*glochidium*) undergoes part of its development as a parasite on fish. The members of the genus *Unio* and its near allies are of considerable economic importance in the United States, where they are cultivated for their pearly shell, which is used in button-making. At one time the pearls obtained from these animals were widely sought in Europe; but this industry has decayed owing to the introduction of the Orient pearls of Ceylon, etc.

MUSSELBURGH, a small burgh of Midlothian, Scotland, 5½ mi. E. of Edinburgh by the L.N.E.R. Pop. (1951), 17,012. The burgh, which lies on the south shore of the Firth of Forth, is intersected by the Esk and embraces the village of Fisherrow on the left bank of the river. While preserving most of the ancient features of its High street, the town, with its fine beach and golf course, has tended to become a suburb of the capital. Loretto school, one of the foremost public schools in Scotland, occupies the site of the chapel of Our Lady of Loretto, which was founded in 1534 by Thomas Duthie, a hermit from Mt. Sinai, and was the favourite shrine of Mary of Guise. The 1st earl of Hertford destroyed it in 1544, and after it was rebuilt the Reformers demolished it again, some of its stones being used in erecting the tolbooth. In the west end of the town is Pinkie house, a Jacobean mansion, with a fine fountain, formerly a seat of the abbot of Dunfermline, but transformed in 1613 by Lord Seton. The painted gallery, with an elaborate ceiling, was utilized as a hospital after the battle of Pinkie in 1547, and Prince Charles Edward slept in it after the fight at Prestonpans (1745). Near the tolbooth stands the market cross. At the west end of High street is a statue of David Macbeth Moir ("Delta," 1798–1851), born in Mussel-

burgh. A 16th-century stone bridge crosses the Esk, and Roman remains have been found near it. The chief bridge, which carries the high road from Edinburgh to Berwick, was built by John Rennie in 1807. The principal industries include papermaking, brewing, the making of nets and wire, confectionery, mats, boatbuilding, pottery, besides saltworks and seed-crushing works. The fishery is confined to Fisherrow, where there is a good harbour. Race meetings and archery contests are held on the links. About 1 mi. S.E. is the site of the battle of Pinkie, and 1½ mi. further is Carberry Hill, where Mary surrendered to the lords of the Congregation in 1567, the spot being still known as Queen Mary's Mount. Musselburgh is in the eastern parliamentary division of Edinburgh, which returns one member.

MUSSET, ALFRED DE [Louis Charles Alfred] (1810–1857), French poet, play-writer and novelist, was born on Dec. 11, 1810 in a house in the middle of old Paris, near the Hôtel Cluny. In the summer of 1827 he won the second prize (at the Collège Henri IV.) by an essay on "The Origin of our Feelings." He took up law and medicine but could endure no profession. He was taken by Paul Foucher to Victor Hugo's house, where he met Alfred de Vigny, Prosper Mérimée, Charles Nodier, Sainte-Beuve, and others. His first original volume, *Contes d'Espagne et d'Italie* (1829), had an immediate success, provoked bitter opposition, and produced many unworthy imitations. This volume contained a fantastic parody in verse on certain productions of the romantic school. This was the famous "Ballade à la lune" with its recurring comparison of the moon shining above a steeple to the dot over an *i*. It was, to Musset's delight, taken seriously.

In December 1830 Musset was just twenty years old, and was already conscious of that curious double existence within him so frequently symbolized in his plays—in Octave and Célio for instance (in *Les Caprices de Marianne*), who also stand for the two camps, the men of matter and the men of feeling—which he has elsewhere described as characteristic of his generation. At this date his *Nuit vénitienne* was produced by Harel, manager of the Odéon. It failed and Musset was disgusted with the theatre.

Musset now belonged, in a not very whole-hearted fashion, to the "Cénacle," but the connection came to an end in 1832. In 1833 he published the volume called *Un Spectacle dans un fauteuil*, and was asked to contribute to the *Revue des deux mondes*. In this he published, in April 1833, *André del Sarto*, and he followed this six weeks later with *Les Caprices de Marianne*. The latter play has perhaps more of the Shakespearian quality—the quality of artfully mingling the terrible, the grotesque, and the high comedy tones—which exists more or less in all Musset's long and more serious plays, than is found in any other of these. Its brilliant dialogue and swiftness of action give it superficially the character of comedy, but throughout there runs the sense of fate.

In 1833 the *Revue* published *Rolla*, a symptom of the *maladie du siècle*. Rolla, for all the strain which is not to be denied of Wertherism, has yet a decided individuality. The poem was written at the beginning of Musset's *liaison* with George Sand, and in December 1833 Musset started on the unfortunate journey to Italy. It is well known that the rupture of what was for a time a most passionate attachment had a disastrous effect upon Musset, who was absolutely and completely struck down by the blow. But it was not so well known until Paul de Musset pointed it out that the passion expressed in the *Nuit de décembre*, written about twelve months after the journey to Italy, referred not to George Sand but to another and quite a different woman. As fiction, the story is told in the two volumes called respectively *Elle et lui* by George Sand, and *Lui et elle* by Paul de Musset.

During Musset's absence in Italy *Fantasio* was published in the *Revue*, *Lorenzaccio* is said to have been written at Venice, and not long after his return *On ne badine pas avec l'amour* was written and published in the *Revue*. In 1835 he produced *Lucie*, *La Nuit de mai*, *La Quenouille de Barberine*, *Le Chandelier*, *La Loi sur la presse*, *La Nuit de décembre*, and *La Confession d'un enfant du siècle*, wherein is contained what is probably a true account of Musset's relations with George Sand. To 1836 belong the *Nuit d'août*, the *Lettre à Lamartine*, the *Stances à la Malibran*, the comedy *Il ne faut jurer de rien*, and the beginning of the brilliant letters of Dupuis and Cotonet on romanticism. *Il ne faut jurer de rien* is as typical of Musset's comedy work as is *Les Caprices de Marianne* of the work in which a terrible fatality underlies the brilliant dialogue and keen polished characterization. In 1837 was published *Un Caprice*, which afterwards found its way to the Paris stage by a curious road. Mme. Allan-Despréaux, the actress, heard of it in St. Petersburg as a Russian piece. On asking for a French translation of the play she received the volume *Comédies et proverbes* reprinted from the *Revue des deux mondes*. In 1837 appeared also some of the *Nouvelles*. In 1839 Musset began a romance called *Le Poète déchu*, of which the existing fragments are full of passion and insight.

In 1840 Musset passed through a period of feeling that the public did not recognize his genius—as, indeed, they did not—and wrote a very short but very striking series of reflections headed with the words "À trente ans," which Paul de Musset published in his *Life*. In 1841 there came out in the *Revue de Paris* Musset's "Le Rhin allemand," an answer to Becker's poem which appeared in the *Revue des deux mondes*. This fine war-song made a great deal of noise, and brought to the poet quantities of challenges from German officers. Between this date and 1845 he wrote comparatively little. In the last named year the charming "proverbe" *Il faut q'une porte soit ouverte ou fermée* appeared. In 1847 *Un Caprice* was produced at the *Théâtre Français*. The word "rebonsoir" shocked some of the old school. But the success of the piece was immediate. In 1848 *Il ne faut jurer de rien* was played at the Théâtre Français and the *Chandelier* at the Théâtre Historique. Between this date and 1851 *Bettine* was produced and *Carmosine* written. The poet died on May 2, 1857

Alfred de Musset now holds the place which Sainte-Beuve first accorded, then denied, and then again accorded to him—as a poet of the first rank. He had genius, though not genius of that strongest kind which its possessor can always keep in check. His own character worked both for and against his success as a writer. He inspired a strong personal affection in his contemporaries. His very weakness and his own consciousness of it produced such beautiful work as, to take one instance, the *Nuit d'octobre*. His *Nouvelles* are extraordinarily brilliant; his poems are charged with passion, fancy and fine satiric power; in his plays he hit upon a method of his own, in which no one has dared or availed to follow him with any closeness. He was one of the first, most original, and in the end most successful of the first-rate writers included in the phrase "the 1830 period." The wilder side of his life has probably been exaggerated; and his brother Paul de Musset has given in his *Biographie* a striking testimony to the finer side of his character. In the later years of his life Musset was elected, not without opposition, a member of the French Academy. Besides the works above referred to, the *Nouvelles et contes* and the *Oeuvres posthumes*, in which there is much of interest concerning the great tragic actress Rachel, should be specially mentioned. (W. H. Po.; X.)

The biography of Alfred de Musset by his brother Paul, partial as it naturally is, is of great value. Alfred de Musset has afforded matter for many appreciations, and among these in English may be mentioned the sketch (1890) of C. F. Oliphant and the essay (1855) of F. T. Palgrave. *See* also the monograph by Arvède Barine (Madame Vincens) in the "Grands écrivains francais" series. Musset's correspondence with George Sand was published intact for the first time in 1904.

See M. Donnay, *Alfred de Musset* (1914); C. Maurras, *Les Amants de Venise: George Sand et Musset* (1916), pp. 316; E. Moroncini, *A. de Musset e l'Italia* (Milan, 1921), pp. 228.

MUSSOLINI, BENITO (1883–1945), Italian politician and journalist, was born July 29, 1883, at Dovia, in the commune of Predappio (province of Forli). His father, Alessandro Mussolini, was a blacksmith of antireligious and vaguely socialist opinions. His mother, Rosa Maltoni, was a school teacher of strong character. Young Mussolini was named Benito after Benito Juarez, the Mexican revolutionary leader. Benito Mussolini was sent by his mother to the Salesian school of Faenza. The boy showed there a vivid intelligence and an insubordinate temper. Later he went to the normal school at Forlimpopoli and qualified as a school teacher at 18, obtaining an appointment at Gualtieri (province of Reggio Emilia).

The Leftist Period.—As a youth Mussolini was interested

Italian-German military alliance was concluded. At the beginning of World War II Mussolini proclaimed a policy of nonbelligerency but on June 10, 1940, declared war on France and Great Britain at the moment he thought Germany had certainly won the war. Italy's subsequent military debacles are described in WORLD WAR II; they led finally to his downfall on July 25, 1943, after the Fascist Grand council, led by Count Dino Grandi, had repudiated his leadership by a vote of 19 to 7. The king "accepted" Mussolini's resignation and appointed Marshal Pietro Badoglio to succeed him. Il duce was placed in protective custody, but on Sept. 12, 1943, the Germans announced he had been rescued by nazi paratroopers at a place later identified as a hotel on Gran Sasso mountain in the Abruzzi. The Germans then set up a "republican fascist party" with Mussolini as its titular head. In April 1945, when the war in Europe was nearing an end, he and his party were apprehended by Italian Partisans outside the Italian village of Dongo, near Como, where, after "trial" they were executed on the 28th.

Mussolini's official biography was published in English by Margherita Sarfatti (Butterworth, 1925). *See* S. Jones, *Benito Mussolini* (1927); Prezzolini, *Benito Mussolini* (1924); P. Orano, *Mussolini da Vicino* (1932); G. Salvemini, *Mussolini diplomatico* (1930); G. A. Borgese, *Goliath: The March of Fascism* (1937). *See* also his own account of his life (Eng. trans. *My Autobiography,* 1928). (M. W. S.; X.)

MUSSOORIE or MASURI, a town and sanitarium of India, in the Dehra Dun district of Uttar Pradesh, about 6,600 ft. above the sea. Population (1941) 5,966, rising to 17,000 in the hot season. It stands on a ridge of one of the lower Himalayan ranges, amid beautiful mountain scenery, and is one of the chief summer resorts for European residents in the plains of the Uttar Pradesh.

Mussoorie practically forms one station with Landaur, 7,362 ft. above the sea. Some distance off, on the road to Simla, is the cantonment of Chakrata, 6,890 ft. The climate makes it suitable for numerous schools for Europeans, including St. George's College, the Oak Grove School of the East Indian railway, and several Church of England and Roman Catholic institutions, together with a cathedral of the latter faith. The first brewery in India was established there in 1850. The town has botanical gardens, and is the summer headquarters of the Trigonometrical survey.

MUSSORGSKY, MODEST PETROVICH (1839–1881), Russian composer, was born at Karevo, Pskov government, March 21, 1839. The son of a landowner, he was sent to the army cadet school in St. Petersburg at 13, and at 17 entered the Preobrazhensky regiment. He became seriously interested in music in 1857, when he met Alexander Dargomijsky, César Cui and Mily Balakirev (*qq.v.*). The following year he began to study systematically under Balakirev, who was only three years older. From the age of 19 Mussorgsky suffered intermittently from a nervous disorder, and before entering the civil service in 1863 led the life of a dilettante, playing the piano in society and beginning various compositions, an opera based on Gustave Flaubert's *Salammbô* and others remaining unfinished. What drove him to earn his living was the liberation of the serfs in 1861, with which he was politically in sympathy, but which impoverished him as a member of a landed family. His first mature songs date from 1864. He was artistically influenced by Michael Glinka, who had died in 1857, but whose sister he met in 1866, and Nicolas Rimsky-Korsakov (*q.v.*), whom he had first known in 1861. Although Rimsky-Korsakov was five years younger and at first as amateurish as any of the circle, he acquired a more solid technical equipment than Mussorgsky ever achieved and, far less of a spontaneous and natural genius though he was, gained a kind of artistic ascendancy over him. The two shared lodgings from 1871 until Rimsky-Korsakov's marriage. This association was to bear questionable fruit after Mussorgsky's death, when his friend undertook to edit the finished and unfinished works left by the composer who, though faultily trained, was by far the most important figure among the five who formed the group known as *moguchaya kuchka* (the mighty handful) including these two, Balakirev, Alexander Borodin and Cui.

In 1868 Mussorgsky, who by that time had written more than half of his many songs, began an opera based on Nikolai Gogol's *The Marriage,* but abandoned it in favour of another, *Boris Godunov,* based on Alexander Pushkin's drama and N. M. Karamzin's Russian history. The first version was finished in 1869, but was at least twice revised by the composer, the second time at the behest of the Imperial opera, which refused to produce the work without a love episode, but at last performed it on Feb. 8, 1874. Yet another version appeared after Mussorgsky's death, drastically altered and "corrected" by Rimsky-Korsakov, and this held the stage until the earlier versions were tried during the 20th century and judged superior by many authorities. They certainly far better represent Mussorgsky's art, which includes some characteristic crudities more interesting and attractive than any editorial polish. The next two operas, *Khovanshchina* (1872–80) and *Sorochintsy Fair* (1874–80), both remained unfinished. Drunkenness laid hold of Mussorgsky more and more disastrously and made him incapable of sustained work. He still wrote many remarkable songs, however, including the cycles *Sunless* (1874) and *Songs and Dances of Death* (1875–77), as well as the vivid piano suite *Pictures From an Exhibition* (1874). He died in misery at a military hospital in St. Petersburg, March 28, 1881.

Mussorgsky survives as a great composer on few works. *Boris Godunov* is recognized as an opera nonetheless great for being in some ways defective, and many of the songs, which show his great gift of outlining human character are among the most striking and memorable ever written. Mussorgsky had neither the copiousness nor the assured craftsmanship of Tschaikovsky, but ranks with him as a great composer, representing at its best the national side of music in Russia as Tschaikovsky stands for its cosmopolitan aspect.

See M. D. Calvocoressi, "Mussorgsky," *Master Musicians Series* (New York, London, 1946). (E. W. BM.)

MUSTAFA KEMAL ATATÜRK (1881–1938), Turkish soldier and statesman, was born in Salonika, Gr.; his father, a customs officer who afterward entered the timber trade, died when Mustafa was a small child. At the military preparatory school he proved to be an exceptional student, especially in mathematics. His teacher in mathematics, who was also named Mustafa, gave him the distinctive surname of Kemal (Arabic, perfection), as a tribute to his ability. He did not receive the name Atatürk till Dec. 1934, when family names were introduced into Turkey by law.

In 1904 he was gazetted lieutenant, but arrested on the same day and, after examination, banished to Damascus, Syr. There, after observing the deplorable condition into which the civil and military organization of the empire had fallen, he founded in 1905 the secret political society Vatan (Fatherland). From Damascus he was transferred to Jaffa, whence he made his way secretly to Salonika to organize a similar political movement in the European provinces. The association which he founded at Salonika was afterward affiliated with the Union and Progress society. The Constantinople government again ordered his arrest; but he escaped and the government presently forgot him. In 1907 he was promoted and sent to Salonika, where he resumed his revolutionary activities.

When the revolution of 1908 re-established the constitution of 1876, Mustafa Kemal found himself in serious disagreement with the leaders of the victorious Union and Progress party. In consequence he abandoned politics for the time and turned his whole energy into his military career, in which he advanced rapidly. In 1911 he went to Tripoli incognito to take part in the war against Italy. There he was promoted to major. The first Balkan War was over before he could return; but in July 1913, during the second Balkan War, he was appointed chief of staff to the newly organized army corps on the Gallipoli peninsula, where he made a detailed first-hand study of the problem of defending the Dardanelles. After the restoration of peace he was appointed military attaché at Sofia with the rank of colonel and held this post until the autumn of 1914.

Mustafa Kemal believed that Turkey had entered the war prematurely and that Germany was doomed to eventual defeat. Possibly for this reason his desire to return to active service was not encouraged; but on his insistence he was appointed commander of the forces at Rodosto, Turk., and afterward (in 1915) at the Dardanelles. He inspired the defense of the straits against the British attack—this, when the Turkish high command had lost hope. Mustafa Kemal was then sent to the Caucasus, where he was promoted to the rank of pasha and recovered Bitlis and Mush from the Russians. In 1917 he was posted to the Hejaz.

At this time Germany's intervention in the internal affairs of Turkey had reached its height, and Mustafa Kemal Pasha put himself at the head of the opposition to it. He sent in a succession of reports adverse to the Baghdad expedition, which he thought would end in another disaster, and when his advice was ignored he resigned. In 1918 he yielded to the insistence of Sultan Mehmed and accepted command of the 7th army corps in Palestine but all chance of taking the offensive, or even averting disaster, had then disappeared.

When the Turkish government negotiated the armistice of Mudros (Oct. 30, 1918), Mustafa Kemal was opposed to the policy of complete surrender and, after the signature of the armistice, retired to Constantinople. The Greek landing at Smyrna on May 16, 1919, which re-awakened the Turkish nation, and his appointment by the Ottoman government in Constantinople as inspector of the 9th army corps in northeastern Anatolia gave him his chance. Mustafa Kemal meant to create a nucleus of national resistance against the partition of the country and therefore accepted with alacrity the position offered him

by the unsuspecting government. As soon as he landed at Samsun he began to organize his new movement locally at Amasia, Tokat and Sivas and to correspond secretly with other parts of the country. The sultan's government, too late, recalled him to Constantinople, but he went on instead to Erzerum and sent in his resignation. He next convened two congresses, one at Erzerum in July, the other at Sivas in Sept. 1919. Both congresses endorsed his program of fighting for national existence to the bitter end, and relations between the capital and the interior of Anatolia were broken. All the efforts of the Constantinople government and the Allied powers to frustrate Mustafa Kemal's activities simply strengthened his conviction. On April 23, 1920, he gathered at Angora the nationalist members of the late parliament who had escaped from Constantinople and was unanimously elected president of this new national assembly.

During the two and one-half years which followed Mustafa Kemal's military ability, intellect and oratory carried his countrymen through their ordeal. During the summer campaign of 1921, which was the supreme crisis of the Graeco-Turkish War, the Angora assembly appointed him generalissimo of the Turkish forces, with unlimited power; and he took personal charge at the front during the 22 days' and nights' fighting of the battle of the Sakaria, which brought him the rank of field marshal and the traditional title of Ghazi (the victorious). The destruction of the Greek army, the peace settlement at Lausanne, Switz., the abolition of the sultanate, the declaration of the republic and the abolition of the caliphate were the direct work of Mustafa Kemal. On Oct. 29, 1923, when the republic was proclaimed, the national assembly unanimously elected him president, an office to which he was re-elected on Nov. 1, 1927, on May 4, 1931 and finally on March 2, 1935. He died on Nov. 10, 1938, and was succeeded as president by Ismet Inönü (*q.v.*).

Atatürk was the builder of a modern Turkish nation, the reformer of all Turkish life. Under his strong guidance the legacy of the mediaeval and oriental Ottoman empire was discarded and the country turned into a modern progressive secularized republic which could keep abreast of all human progress and take a constructive place at the side of other nations. Though Atatürk, in view of the general backwardness of the country, could accomplish his aim only by dictatorial methods, he remained faithful to the progressive and liberal ideas of his youth. He emancipated the Turkish women, established complete equality of all citizens, introduced universal education and became an educator to democratic forms of life. The democratic constitution of the republic was jealously guarded; Atatürk regarded his dictatorship as a temporary institution for strengthening the foundations of liberal democracy in a population not prepared for it.

In foreign affairs Atatürk resolutely abandoned all dreams of expansion or of military glory, so dear to other nationalist dictatorships. He taught the Turks the virtue of moderation in their aspirations and even succeeded in making a lasting peace with the Greeks, with whom the Turks had fought bitterly for many centuries and whom he had defeated shortly before. The firm friendship with Greece allowed Turkey to become the leader in an effort to secure a lasting peace by collective agreements with its neighbours: the Balkan pact which united Turkey with Greece, Yugoslavia and Rumania; and the Near Eastern pact which united it with Iran, Afghanistan and Iraq. Atatürk also maintained close and friendly relations with the U.S.S.R., which had helped Turkey throw off the conditions of the peace of Sèvres. He also led Turkey to join the League of Nations and to make peace with the former enemy nations, Great Britain and France.

Bibliography.—Mustafa Kemal Atatürk delivered a long justification of his activities before the members of his party in Angora (Oct. 15–20, 1927), official translation, *Die Neue Türkei*, 2 vol. (Leipzig, 1928); *see* also Harold C. Armstrong, *Grey Wolf* (London, 1932); Philippe de Zara, *Mustapha Kémal Dictateur* (Paris, 1936); Hans Kohn, *Western Civilization in the Near East* (1936); Herbert Melzig, *Kamâl Atatürk* (Frankfurt a.M., 1937); Donald E. MUSTANG, the wild or semiwild horse of the prairies of North America, the descendant of the horses imported by the Spaniards after the conquest in the 16th century (*see* Horse).

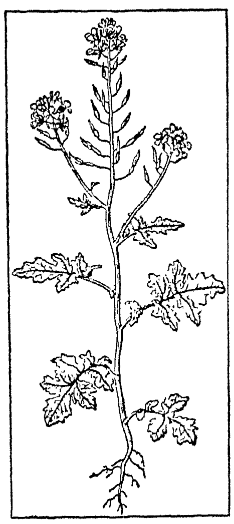
MUSTARD. The varieties of mustard seed of commerce are produced from several species of the genus *Brassica* (family Cruciferae). Of these the principal are the black mustard, *Brassica nigra* (*Sinapis nigra*), the white mustard, *Brassica alba*, and the Sarepta mustard, *B. juncea*. Both the white and black mustards are cultivated to some extent in various parts of England, Europe and North America. The white is grown as a salad plant and has come into increasing favour in England as a forage crop or as a green manure. The black mustard is grown solely for its seeds, which yield the condiment. When white mustard is cultivated in England for its herbage it is sown usually in July or August, after some early crop has been removed. In about six weeks it is ready either for feeding off by sheep or for plowing down as a preparative for wheat or barley.

Brassica nigra occurs as a weed in waste and cultivated ground throughout England and the south of Scotland, and widely in the United States and Canada. It is a large branching annual 2 to 3 ft. high with stiff, rather rough, stem and branches, dark green leaves ranging from lyrate below to lanceolate above, short racemes of small bright yellow flowers one-third of an inch in diameter and narrow smooth pods. *B. alba* is more restricted to cultivated ground in Great Britain and has only sparingly escaped from cultivation in the United States; it is distinguished from black mustard by its smaller size, larger flowers and seeds, and spreading rough hairy pods with a long curved beak.



BY COURTESY OF THE NATURAL HISTORY MUSEUM

WHITE MUSTARD (SINAPIS ALBA), SHOWING FLOWERS AND FRUITS (SILIQUAE)

The pungency and odour to which mustard owes much of its value are due to an essential oil developed by the action of myrosin, an enzyme, upon the glucoside (*see* Glucosides, Natural) sinigrin, $C_{10}H_{18}KNS_2O_{10}$. In presence of water myrosin acts on sinigrin, splitting it up into the essential oil of mustard, a potassium salt and glucose. The enzyme is destroyed by boiling water, and therefore it is not proper to use very hot water (above 120° F.) in the preparation of mustard. Essential oil of mustard is an isothiocyanate of allyl, C_3H_5NCS. The seed of white mustard contains in place of sinigrin a peculiar glucoside called sinalbin, $C_{30}H_{44}N_2S_2O_{16}$, in several aspects analogous to sinigrin. In presence of water myrosin splits sinalbin up into acrinyl isothiocyanate, sulphate of sinapin and glucose. The first of these is a powerful rubefacient, whence white mustard, although yielding no volatile oil, forms a valuable material for plasters.

Both as a table condiment and as a medicinal substance, mustard has been known from a very remote period. Under the name of νᾶπυ it was used by Hippocrates in medicine. The dry form in which table mustard is sold in the United Kingdom dates from 1720, about which time Mrs. Clements of Durham hit on the idea of grinding the seed in a mill and sifting the flour. In the United States a thin paste of mustard prepared with vinegar and spices is commonly sold in glass for table use.

The volatile oil distilled from black mustard seeds after maceration with water is official in the *British Pharmacopoeia* under the title *Oleum sinapis volatile*. In the United States *Pharmacopoeia* it is called *Sinapis nigra*. It is a yellowish or colourless pungent liquid, soluble only in about 50 parts of water, but readily so in ether and in alcohol. From it is prepared, with camphor, castor oil and alcohol, the *linimentum sinapis*. The mustard plaster or *Emplastrum sinapis* of the U.S. contains mustard mixed with flour from one to four parts. Used internally as a condiment, mustard stimulates the salivary but not the gastric secretions. It increases the peristaltic movements of the stomach. One drachm to half an ounce of mustard in a tumblerful of warm water is an efficient emetic, acting directly on the gastric sensory nerves. It should be used only for emergency treatment of poisoning.

Brassica juncea, leaf mustard, is grown extensively in the orient and to an increasing extent in the United States as a salad plant or potherb. There are numerous forms and horticultural varieties that produce large, rather upright rosettes of attractive leaves, varying from broad and flat through spatulate to very much curled. These forms shoot to seed much later than common white or black mustard and produce a much greater yield of leaves. The species is adapted to cool seasons, and grows well in any good garden soil. It is usually sown thinly in rows 1½ to 2 ft. apart and the plants thinned to stand 2 to 3 in. apart in the row. (V. R. B.)

MUSTARD GAS, the name given to β, β'-dichlorodiethyl sulphide, one of the most effective toxic agents used during World War I. This substance is not easily destroyed by weathering; at ordinary temperatures, it is a liquid which evaporates only slowly. It therefore tends to persist for days or weeks in any area where it has been released. This property largely governs its tactical use. Inhalation of a sufficient quantity of mustard-gas vapour causes pulmonary inflammation. When the vapour or (more particularly) droplets of the liquid come in contact with the skin, severe blisters

and burns are produced (vesicant effect). Of these two modes of action, the second is by far the more important for military purposes. In World War I mustard gas caused many temporary casualties but few permanent injuries and still fewer deaths. (*See* CHEMICAL WARFARE.)

MUSTARD OILS, a general term applied to the esters (*q.v.*) of isothiocyanic acid. The name arises from the fact that allyl isothiocyanate occurs in, and forms the principal component of, the oil obtained by distilling black mustard seeds (*Sinapis nigra*). These seeds contain a glucoside (*q.v.*) termed potassium myronate which undergoes a fermentative change due to an enzyme (*q.v.*) myrosin also present in the seeds. *Allyl mustard oil* (allyl isothiocyanate), $C_3H_5{\cdot}N{:}C{:}S$, is a colourless liquid sparingly soluble in water and boiling at 151° C.; it has a sharp pungent odour and produces blisters on the skin, whence the efficacy of the mustard poultice as a counterirritant. It can be prepared synthetically by heating allyl bromide, $CH_2{:}CH.CH_2Br$, with potassium thiocyanate. The odour and taste of mustard (*q.v.*) are due to this substance.

The analogues of allyl isothiocyanate are readily prepared by the action of carbon bisulphide on primary amines, when alkyl dithiocarbamates are formed which on distillation with mercuric chloride yield the corresponding mustard oils. These compounds are colourless liquids with pungent irritating odours. This general reaction proceeds so smoothly that it is employed as a distinctive test for primary amines. (*See* AMINES.) Methyl and ethyl mustard oils are thus obtained from methylamine and ethylamine, respectively; the former, a solid, melts at 35° C. and boils at 119°C.; the latter is liquid and boils at 134° C. Phenyl mustard oil from aniline is a colourless liquid boiling at 222° C.

MUSURUS, MARCUS (*c.* 1470–1517), Greek scholar, was born at Rhithymna (*Retimo*) in Crete, and was a pupil of John Lascaris at Venice. He was professor of Greek at Padua and Venice, and died in 1517. Since 1493 Musurus had been associated with Aldus Manutius, and belonged to the "Neacademia," a society founded by Manutius and other learned men for the promotion of Greek studies. Many of the Aldine classics were brought out under Musurus's supervision, and he is credited with the first editions of the scholia of Aristophanes (1498), Athenaeus (1514), Hesychius (1514), Pausanias (1516).

See R. Menge, *De M. Musuri vita studiis ingenio,* in vol. 5 of M. Schmidt's edition of Hesychius (1868).

MUTATION: *see* VARIATION: *Experimental;* HEREDITY; EVOLUTION, ORGANIC.

MUTIAN, KONRAD (1471–1526), German humanist, was born in Homberg on Oct. 15, 1471 of well-to-do parents named Mut, and was subsequently known as Konrad Mutianus Rufus, from his red hair. At Deventer under Alexander Hegius he had Erasmus as schoolfellow; he took the master's degree at Erfurt in 1492. From 1495 he travelled in Italy, taking the doctor's degree in canon law at Bologna. Returning in 1502, the landgraf of Hesse promoted him to high office. The post was not congenial; he resigned it (1503) for a small salary as canonicus in Gotha. The circle which gathered round Mutian at Erfurt, known as the *Mutianischer Bund,* included Eoban Hess, Crotus Rubeanus, Justus Jonas and other leaders of independent thought. He wrote little himself, but inspired others. He desired the reform of the Church, but not schism. Like Erasmus, he was with Luther in his early stage, but deserted him in his later development. Though he had personally no hand in it, the *Epistolae obscurorum virorum* (due especially to Crotus Rubeanus) was the work of the Reuchlinists in his *Bund.* He died at Gotha on March 30, 1526.

See F. W. Kampschulte, *Die Universität Erfurt* (1858–1860); C. Krause, *Eobanus Hessus* (1879), and *Der Briefwechsel des Mutianus Rufus* (1885).

MUTILATIONS AND DEFORMATIONS. In every part of the world to-day, both in civilised as well as uncivilised communities some form of mutilation of the human body is found; but the widest variety of mutilations as well as the most severe occur among the more primitive peoples.

Early historians and writers, long before the Christian era, show that in those days such mutilations as tattooing and circumcision, as well as skull deformation, were well known. Some form of mutilation was probably practised from earliest prehistoric times. On the cave walls of France and Spain, where Aurignacian and Magdalenian man painted the mammoth, elephant and woolly rhinoceros during the closing phases of the last Ice Age (*see* ARCHAEOLOGY: *Stone Age*), are painted hands which indicate the removal of one or more finger joints, a practice common today in South Africa, India and elsewhere. The reason for this mutilation on the part of prehistoric man can only be conjectured by analogy with these modern primitive peoples. In the Wellcome Historical Medical Museum in London, there is exhibited a skeleton of an early man from a prehistoric grave at Gebel Moya in the Sudan. Found close to the jaw is a stone stud exactly similar to the lip studs worn by Nilotic peoples today. Other evidence may be found in folk tales; early paintings and carvings, and by a careful interpretation of objects found in the graves. The motives behind mutilation may be classified as: Tribal Convention; Adornment; Initiation Ceremonial; Religion; Punishment and Health.

Skin.—Tattooing consists of puncturing the skin in the pattern desired and rubbing in colouring material so that the pattern is indelibly fixed. In New Zealand the Maoris brought tattooing to a very high art, and the intricate patterns with which they adorned their faces were executed with exquisite workmanship and taste. In China, Borneo, India and other parts of the Far East tattooing is prevalent, and thence has been introduced into Europe, chiefly by sailors. Arms, legs, body and face are all considered suitable surfaces for decoration. To-day tattooing saloons exist in London and in many of the bigger sea-ports. True tattooing, but of a less lasting nature, is occasionally found in parts of Africa, and must not be confused with scarification.

Scarification.—This consists of cutting deep marks into the skin and rubbing in charcoal and other irritant material to keep open the wound which eventually is allowed to heal but which leaves a deep scar. Sometimes the wound is so treated that a shiny "keloid" instead of a flat scar results. Scarification occurs all over Africa for reasons as numerous as they are different. Very frequently small scars are made on the face which serve as tribal and clan marks. Often elaborate patterns are worked out on the chest for purely personal adornment; these are especially good on the West Coast. Sometimes the object of the operation is semi-magical, women of many African tribes being scarified on the abdomen during pregnancy. At other times, scarification is merely the result of surgical treatment and is the consequence of rather crude cupping methods followed by the application of an irritant powder. In Australia the aborigines scarify their arms and chests, which often show great black keloids representing many years of patient work, the wound being opened up from time to time and fresh irritants applied.

Hair.—Depilation by some means or other, has been practised by primitive peoples for hundreds of years, while all modern civilised peoples still continue to remove unwanted hair by various methods. One of the widely accepted modern methods employs electrolysis as a means for removal of adventitious growth of hair. One of the commonest primitive methods of hair removal is by plucking out each individual hair by its root, every time it grows. By starting at an early age the time comes when the hair on the parts so treated could be grown only sparsely even if desired. Depilation by plucking is common all over Africa and in many parts of the east and Oceania. The areas so treated are more especially the face and pubic regions, and chest and under the arms. Some individuals even go to the length of removing all body hair.

Shaving of the face, as well as of the scalp, is a common practice among primitive people, and may be carried out with such instruments as a piece of broken glass, or a special iron blade. It is usually done dry, without the use of water or lather. Depilation by singeing, as well as by the use of ointments occasionally occurs. Removal of the hair is usually due to tribal custom, as hairy people are despised and often unable to find a mate.

Head.—There are few if any parts of the world where some portions of the head and face entirely escape mutilation, but the

most commonly maltreated are the ears, nose, lips and teeth. Skull deformation may be the result of deliberate intention, or of chance. In some tribes, especially in America every individual was intentionally treated as a child with the direct view of reducing the skull to a certain shape. In other cases, as in parts of Africa, deformation is the unintentional result of the local methods of carrying water pots or loads on the head. Young children, especially girls, start such work long before the skull is properly developed and the result is a definite and fairly uniform deformation. Skull deformation occurs in nearly every part of the world, though commonest in the Americas and least common, if at all existent, in Australia. Intentional deformation is carried out from various motives, sometimes a long pointed head, sometimes a flat depressed head being the shape required. Various methods are employed, commonest of which are by bandaging, and by tying the child's head to a flat board fixed to the occipital region.

Ears.—These are pierced to carry earrings all the world over, indeed very few, primitive or civilised peoples, leave the ears totally unmutilated, though the Andamanese, Bushmen and true Baganda are reported as doing so. Both the ear lobes, as well as the cartilage round the top of the ear, are commonly pierced. This is usually done during childhood and a small piece of wood is inserted into the wound which is then left to heal. Later this plug is removed and a larger one inserted, the process being continued until the required size of hole is obtained by reason of this continual stretching. In many countries both sexes treat their ears in this way, while in others it is confined to one or other sex. The greatest distensions are to be found in Borneo and East Africa. In both these places lobes are often seen so stretched that they hang down to the shoulder, with holes so large that it would be possible to pass a closed fist through them. In all these ear mutilations adornment is the end in view. Large carved wooden plugs, carved stone ornaments, metal rings and fibre and paper rolls, all are used as earrings, while to-day even earthenware jam pots and circular cigarette tins are popular in some parts of Africa.

In some tribes such as the Kikuyu, a husband if displeased with his wife breaks the lobe of her ear with his hands.

Nose.—The nose is often mutilated for purposes of personal adornment especially in India, and the East, as well as in New Guinea and Polynesia, S. America, Australia and in parts of Africa. Nose ornaments also signify social rank. Sometimes it is the alae, and sometimes the septum which is perforated. Often only a small hole is made through the septum from which a gold ring or other jewel is suspended; at other times the hole in the septum is big enough for a finger to be passed through. Elsewhere one, and occasionally both, nostrils are pierced and distended to carry coloured studs, sometimes of unbelievable size, as among the Makonde of Portuguese East Africa. Nose ornaments are more common with women than men, but in New Guinea and especially among the Tugeri and the Solomon Islanders, the men wear great pointed sticks, or sometimes the tusks of wild pig through holes in the nose.

Lips.—In several parts of Africa, especially in the Congo, the south east Tanganyika Territory, and the upper reaches of the Nile, and among the Botocudo of S. America enormous plates and plugs are inserted in hugely distended holes, cut in the upper and lower lips. The lip studs and pins of the Nilotic peoples of Uganda, Kenya Colony and the Sudan are usually small and made of ivory, rock crystal or stone, and are inserted through the upper and lower lips or both. Other lip mutilations include pricking and rubbing with irritant to cause them to swell. This is done in parts of West Africa.

Teeth.—Over the greater part of Africa, as well as in Australia, New Guinea and elsewhere, it is a common practice to remove one or more front teeth in the upper or lower or both jaws. Sometimes the ceremonial knocking out of the teeth accompanies initiation and is a test of ability to bear excruciating pain unflinching; sometimes it is simply a matter of custom; sometimes it serves as a tribal mark, while yet another reason given is the fear of lock-jaw. The removal of the teeth is in this case a precaution which would enable the patient to be fed if the disease were contracted.

Another common practice in Africa, found also in Southern India, is the filing or chipping of teeth to serve either as a tribal mark or as an initiation step, or for both purposes. The Akamba and certain Congo peoples file their incisors to sharp points, and for some unknown reason this was considered by early travellers as a sign of cannibalism—a most erroneous view. The Eskimo file the teeth to make them shorter and less like those of dogs and in south and central Africa the incisors are filed to all sorts of shapes and patterns as described by Dr. G. Turner in the *Transvaal Medical Journal* for 1911

The Dyaks of Borneo and other people in the East, occasionally drilled holes in the teeth, into which plugs of gold were driven to serve as ornament. This method of adornment was also used in ancient Mexico, precious stones being inlaid in the teeth.

Tongue, Cheeks and Neck.—Among the Bateso of East Africa a hole is sometimes bored through the tongue and a brass ring bearing one or two beads is inserted. The cutting out of the tongue was once a legal penalty in Europe, and has only recently been forbidden in some parts of Africa.

The Aleutian Islanders bored a hole through each cheek through which seal's whiskers were stuck. Feathers are put through holes in the cheek in parts of S. America.

The *Padang* of the South Shan States deform the necks of their womenfolk by making them wear—from early childhood onwards—high metal collars whose length is gradually increased; this eventually produces such elongation and dislocation of the neck that if the collars were removed the wearers would not be able to hold up their heads.

Eyes and Body.—Putting out eyes as a punishment for various crimes has existed at different times all over the world—Europe included. Priests and worshippers of certain eastern cults still gash and cut themselves with knives as did the priests of Baal in olden times. In parts of Africa it was once a practice to cut off the breasts of an unfaithful wife.

Limbs.—In former times both in England, and Europe generally, amputation of one or more limbs was a common punishment for crime (*see* Pike's *History of Crime in England,* 1893), and this method has only been suppressed in parts of Africa, as in the Congo and Uganda, by the European governments.

For purposes other than punishment and medical necessity, amputation consists chiefly of cutting off the finger joints, especially the little finger. In South Africa this is either done as mourning, or as a magical preventative measure in the case of a child born to a mother whose last baby was still-born. In Southern India grandmothers used (in some castes) to have to cut off one joint for each grandson born to them. In the Tonga Islands the practice is also considered as of magical importance against disease. There is too the bandaging of girl children's feet to prevent their development. This Chinese practice is now prohibited.

MUTINY: *see* MILITARY LAW and COURT-MARTIAL.

MUTIS, JOSÉ CELESTINO (1732–1808), Spanish naturalist, was born at Cadiz on April 6, 1732. He received his bachelor's degree at the University of Seville and afterwards studied medicine at Madrid where in the general hospital he became for a time a lecturer in anatomy. His preference, however, was for the study of mathematics and natural science, especially botany. He became one of the first disciples of the Swedish botanist, Linnaeus (*q.v.*), in Spain. Attracted by the wide and fruitful fields of study which South America then afforded he sailed in 1760 for New Granada (Colombia), accompanying the Spanish viceroy as physician. In New Granada he occupied himself collecting and describing plants both from the lowlands and from the higher Andean regions, but he did not neglect medicine as is shown by his appointment as king's physician in the viceroyship. He spent much time on sanitary problems such as the establishment of proper cemeteries, the prevention of small-pox and the reduction of malaria. He put into general use many American herbs, the properties of which he had studied, among them ipecacuanda, guaco and Peruvian balsam. Some of these, such as the cinnamon laurel of the Andes, he made known in Europe. His

favourite study, however, was quinine, which he studied from every angle from the distribution of the different species of cinchona down to experiments in the curative properties of the drug. His *El Arcano de la quina* was published in 1793. Later studies were published in the *Papel periodico* and after his death by his nephew Sinforoso Mutis, who completed and arranged his notes on the subject (1828). His work probably had much to do with making possible the colonization of malaria-infested regions. It attracted the attention of the king, who created the Royal Botanical expedition of New Granada and placed Mutis at its head. With 18 of his best students, Mutis carried out a systematic survey in which material was collected for the monumental *Flora de Bogotá ó de Nueva Granada* which he planned in 13 folio volumes.

Because of his immense activity in other lines only the first volumes of this intended work were arranged at his death. For the remaining volumes he left manuscripts, notes, illustrations and sketches in such profusion that only some one knowing his schemes of arrangement could have finished the work. Among these botanical riches were 6,480 illustrations, admirable in precision and colour, which were intended for an atlas volume. This material, amounting to more than 4,000 folios of loose manuscripts, and his collection of more than 20,000 plants were sent after his death to the botanical garden at Madrid, where they are preserved.

For 18 years Mutis carried on a correspondence with Linnaeus, much of which was published in *A Selection of the Correspondence of Linnaeus* (1821). He furnished many specimens of plants which the Swedish naturalist described. Linnaeus named in his honor the beautiful genus *Mutisia*, of the family Compositae, comprising about 50 species of plants found in South America.

He died at Bogotá on Sept. 11, 1808.

MUTSU HITO: *see* MEIJI TENNO.

MUTTON. Mutton is the flesh of mature sheep; that of the younger animals is called lamb. Because sheep are widely available except in the moist tropics, are easily butchered and cooked and are small enough to permit prompt consumption when refrigeration is not available, meat from sheep in moderate amounts is consumed widely by human beings. Moreover, religious objections to the eating of sheep's meat are not nearly so widespread as are those relating to some other domestic livestock. The great demand for lambs occurs at the Easter season, when lamb is sought not only by Christians, including the Greek Orthodox, but also by Orthodox Jews for the Feast of the Passover. Some producers specialize in hothouse or Easter lambs which are ready for the market out of the normal season.

The preferred cuts, including ribs, loins and legs, are excellent but comparatively expensive meat items. The less desirable cuts, particularly from the older animals, provide one of the most economical sources of high-grade protein. On the basis of 100 g., raw edible portion, leg roast of lamb compares very favourably in food energy, phosphorus and vitamins with beef (round steak). (*See* table.) Nevertheless, in some parts of the world, particularly the

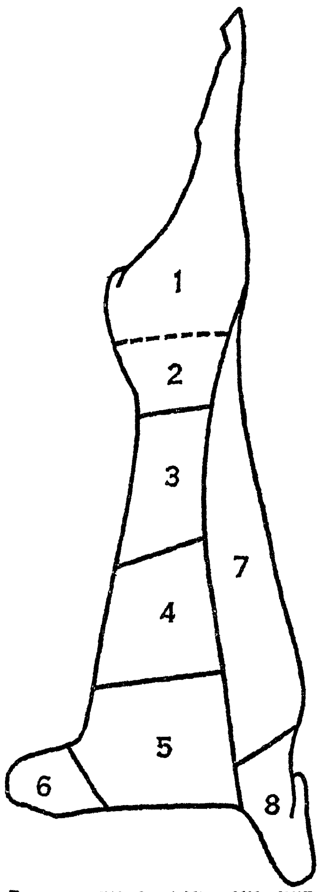
Leg Roast of Lamb and Beef (*Round Steak*)
(100 g.; raw edible portion)

Properties	Lamb	Beef	Properties	Lamb	Beef
Water	63.7%	69.0%	Phosphorus	213.0 mg.	180.0 mg.
Food Energy	235 cal.	182 cal.	Iron	2.7 mg.	2.9 mg.
Protein	18.0 g.	19.5 g.	Thiamine	.16 mg.	.08 mg.
Fat	17.5 g.	11.0 g.	Riboflavin	.22 mg.	.17 mg.
Calcium	10.0 mg.	11.0 mg.	Niacin	5.2 mg.	4.7 mg.

United States, consumption of lamb and mutton has declined, largely because of decreasing availability. In the U.S. it dropped from a 6.7-lb. average per person per year before World War II to about 4 lb. in the postwar period.

Production.—Most sheep are slaughtered for consumption directly from pasture or the range. This applies to those entering overseas commercial channels, as from New Zealand and Argentina, as well as to those consumed locally. However, several million head (chiefly lambs) are "fattened" each year, particularly in the U.S. and the United Kingdom. A variety of feedstuffs—hay, grain, sugar beet pulp, silage, etc.—is utilized to produce additional weight and to improve condition. This conditioning may be done in or near the pasture area or, after transport, in an area of surplus feedstuffs nearer the ultimate consumption market.

Slaughter to serve the major urban and export markets occurs largely in the best-equipped, most modern packing houses. The animals are "round dressed"; *i.e.*, the pelt, head and viscera are removed. The hind shanks are disjointed at the hoof head and the front shanks at the bottom of the cannon bone. Studies involving about 15 breeds and crossbreeds of sheep indicate that dressing percentage varies widely from breed to breed. Carcass weight in relation to live weight will approximate 50% for the better mutton breeds but considerably less for those of Merino derivation, developed especially for their wool.



RETAIL CUTS OF LAMB AND MUTTON (*see* TEXT OF ARTICLE FOR EXPLANATION)

Though mutton and lamb in 1952 were estimated to account for only 8% of the 77,200,000,000 lb. of total meat output in principal countries exclusive of the far east, it may be estimated that for the world as a whole approximately 400,000,000 head or more of sheep and lambs are consumed yearly, or roughly 10,000,000 tons of meat. They are the main meat of many nomadic tribes of the steppe and desert edge, a fact which contributes to the difficulty of obtaining an estimate.

Trade.—Though all sheep are potentially producers of a joint crop of wool and meat, New Zealand, Argentina, the United Kingdom and western continental Europe, the United States to a considerable extent and even some parts of Australia of late years have emphasized meat production.

International trade in mutton and lamb, mostly in chilled or frozen form, prior to World War II averaged about 350,000 metric tons per year. In the postwar period the average rose to about 440,000 tons. Exports from particular countries vary widely from year to year but come largely from the following countries in approximate amounts: New Zealand (260,000 tons); Argentina (100,000 tons); Australia (60,000 tons); Uruguay (less than 10,000 tons). The major importer has been the United Kingdom, receiving about 400,000 tons per year, much of it from New Zealand under a long-term purchasing agreement.

Classes and Grades of Carcasses.—Age of the animal is a primary determinant of class. "Milk lambs" may be marketed at three to five months of age, prior to or at weaning time, for special luxury or religious festival trade. The usual "lamb" is 6 to 12 months old and may be marketed directly from pasture or after special fattening. The "yearling" is 12 to 20 months old, the "mature mutton" older. There is no sex differentiation except as to the older animals, which are predominantly ewes (discarded breeding females), bucks (uncastrated mature males) and, more rarely, wethers (males castrated when young but retained probably for wool production).

Conformation, finish and quality also enter into government and packer grades. Conformation relates to "meatiness," a high proportion of meat in relation to bone, but especially a high percentage of weight in the higher-priced cuts; *i.e.*, ribs, loins and legs. Conformation is much affected by improved breeding. Finish, some-

what related to the breed of sheep, is also dependent on the quality of pasturage or feeding. For good flavour and tenderness there should be a covering of at least ¼ in. of fat and good marbling (fat in the connective tissue). Quality relates to texture, the colour of the lean and the fat and the colour and porosity of the bone in relation to the age of the animal. Government grades are prime, choice, good, commercial, utility and cull. Only a small percentage of mature mutton carcasses grade as high as "good."

Cuts and Cookery.—Lamb and mutton give the skilled cook wide latitude for his art, ranging from the simplest broiling to the use of complicated sauces and herbs. The leg (*see* diagram, sections 1 and 2) is used as a roast or for steaks, retaining the tibia bone if a long French leg is desired. The sirloin (2) from a heavy leg may be used separately for roasting or chops. The loin (3) and the ribs (4) are prime chops. The English chop is a double loin chop, with which the kidney may be retained. Rib chops become French chops by clearing the bone end for an inch or more and covering it with a "chop holder." The shoulder (5) provides chuck rib or shoulder chops or may be roasted. The neck (6) and the shank (8) are braised or stewed, and the breast (7) is normally stewed.

Bibliography.—Orville G. Hankins, "Estimation of the Composition of Lamb Carcasses and Cuts," *Technical Bull.*, no. 944, U.S. Department of Agriculture (1947); Sleeter Bull, *Meat for the Table* (New York, 1951); National Live Stock and Meat Board, *Meat and Meat Cookery* (1942). (J. K. R.)

MUTTONBIRD: *see* Shearwater.

MUTTRA (officially, and anciently, Mathura), a city and district in the Agra division of Uttar Pradesh, India. The city is on the right bank of the Jumna, 30 mi. above Agra; pop. (1951) 105,773 (municipality 98,552, cantonment 7,221). In the 6th century B.C. it was the capital of the Saurasenas. Fa Hien (*c.* A.D. 400) refers to it as a centre of Buddhism; but his successor Hsuan Tsang (*c.* 650) is forced to record a Brahmanical revival. It was sacked by Mahmud of Ghazni in 1017–18; about 1500 Sultan Sikandar Lodi destroyed all the Hindu shrines, temples and images; and in 1636 Shah Jahan appointed a governor expressly to "stamp out idolatry." In 1669–70 Aurangzeb visited the city and continued the work of destruction. Muttra was again captured and plundered by Ahmad Shah with 25,000 Afghan cavalry in 1757. The town is still a great centre of Hindu devotion, and temples and bathing stairs line the river bank. The majority are modern, but the mosque of Aurangzeb, on a lofty site, dates from 1669. Most of the public buildings are of white stone, handsomely carved. The city is the seat of two colleges of Agra university and of the Curzon museum of antiquities. Cotton, paper and pilgrims' charms are the chief manufactures.

Muttra District (area 1,467 sq.mi.; pop., 1951, 912,264) consists of an irregular strip of territory on both sides of the Jumna. The eastern half consists of a rich upland plain, abundantly irrigated by wells, rivers and canals, while the western part, though rich in mythological association and antiquarian remains, is comparatively unfavoured by nature. The principal crops are millet, pulse, cotton, wheat, barley and sugar cane. The eastern half is watered by the navigable Agra canal and the western half by branches of the Ganges canal. The central part of Muttra district is one of the most sacred spots in Hindu mythology. The district within a circuit measuring about 170 mi. around Gokul and Brindaban was called Braj-Mandal and had many associations of earliest Aryan times. There Krishna and his brother Balarama fed their cattle; and numerous relics of antiquity in the towns of Muttra, Gobardhan, Gokul, Mahaban and Brindaban attest the sanctity of this holy tract. After the invasion of Mahmud of Ghazni the city fell into insignificance till the reign of Akbar; thenceforward its history merges in that of the Jats of Bharatpur, until it again acquired separate identity under Suraj Mal in the mid-18th century. The whole of Muttra passed under British rule in 1804.

Bibliography.—F. S. Growse, *Mathura: A District Memoir* (London, 1883); J. P. Vogel, *Catalogue of the Archaeological Museum at Mathura* (Allahabad, 1910) and "La Sculpture de Mathura," *Ars Asiatica* (Paris and Brussels, 1930).

MUTULE, in architecture, a rectangular block, beneath the soffit or underside of the projecting portion of the cornice of the Doric order. (*See* Order.) It is usually decorated on the underside with guttae (*q.v.*) or little cylindrical projecting blocks. In Greek work its lower side is inclined, following approximately the roof slope; in Roman and Renaissance work it is generally level and is crowned with a cap moulding. In origin it is probably a stone representation of an original projecting wooden rafter end.

MUYBRIDGE, EADWEARD (Edward James Muggeridge) (1830–1904), British photographer and pioneer in motion photography, was born at Kingston-on-Thames April 9, 1830. He emigrated to the U.S. in 1852 and was engaged in business until 1860, when he joined the U.S. coast and geodetic survey as a photographer. In 1872 he made a series of photographs which proved that at one point in its stride a galloping horse has all four feet off the ground. His major work, published in 1887, was *Animal Locomotion: An Electro-photographic Investigation of Consecutive Phases of Animal Movements, 1872–1885,* 11 vol., containing 781 photoengravings.

Muybridge also developed the zoopraxiscope, a forerunner of the modern motion-picture projector. Photographs were mounted on a disk which when rapidly rotated recaptured the original motion of the subjects and cast the enlarged images upon a screen.

Muybridge returned to Kingston-on-Thames in 1900 and died there May 8, 1904.

MUZAFFAR-ED-DIN, shah of Persia (1853–1907), the second son of Shah Nasr-ed-Din, was born on March 25, 1853. He was in due course declared *vali ahd,* or heir apparent, and invested with the governorship of Azerbaijan, but on the assassination of his father in 1896 it was feared that his elder brother Zill-es-Sultan, the governor of Isfahan, might prove a dangerous rival, especially when it was remembered that Muzaffar-ed-Din had been recalled to Tehran by his father upon his failure to suppress a Kurd uprising in his province. Muzaffar-ed-Din was duly enthroned, with the support of the British and Russian governments, on June 8, 1896, the Russian general Kosakowsky, commander of the Persian Cossacks, presiding with drawn sword.

In the summer of 1906 popular discontent culminated in extraordinary demonstrations at Tehran, which practically amounted to a general strike. The shah proclaimed a liberal constitution, the first parliament being opened by him on Oct. 12, 1906. Muzaffar-ed-Din died on Jan. 8, 1907, being succeeded by his son Mohammed Ali Mirza.

MUZAFFARGARH, a municipality, *tehsil* (subdivision) and district of the Multan division of Punjab province, Pakistan. The town (pop., 1951, 11,271) is near the right bank of the Chenab, 20 mi. S.W. of Multan. Its fort and mosque were built by Nawab Muzaffar Khan in 1794–96.

Muzaffargarh Tehsil had a population in 1951 of 234,856.

Muzaffargarh District (area 5,605 sq.mi.; pop., 1951, 751,249) occupies the dagger-shaped southern end of the Sind-Sagar *doab* between the Indus and Chenab rivers. The northern half of the district is an arid plateau, the *thal,* in the cold months the grazing ground of the camel herds belonging to Afghan *povindah* merchants. Elsewhere in the district wheat, pulse, rice and indigo are cultivated. Irrigation is effected from the two rivers.

MUZAFFARPUR, a town and district in the Tirhut division of Bihar, India. The town, which is the divisional headquarters, is on the right bank of the Little Gandak river, about 36 mi. N.N.E. of Patna. Pop. (1941) 54,009. The town is well laid out along two lakes and is an important trade centre, being on the Patna-Nepal route. Four colleges in the town are connected with Patna and Bihar universities. Muzaffarpur is the headquarters of the Behar Light Horse.

Muzaffarpur District (area 3,025 sq.mi.; pop., 1951, 3,520,739) is a plain watered by the Great Gandak, Baghmati and Little Gandak rivers and their tributaries; it is dotted with mango groves and clumps of bamboo. It is closely cultivated, rice being the main crop. The indigo industry, almost extinguished by the coming of the synthetic dye, was largely replaced by sugar.

Excavations revealed the remains of buildings of *c.* A.D. 300; hundreds of seals of the 4th or 5th century A.D. also have been found. At Kolhua, 3 mi. N.W. of Muzaffarpur, is a pillar crowned by a lion, set up by the emperor Asoka to mark a stage of his journey to Nepal in 249 B.C.

MUZIANO, GIROLAMO (1528–1592), Italian painter, was born at Acquafredda, near Brescia, in 1528. He died in Rome, and was buried in the church of Santa Maria Maggiore. He came to Rome about 1550, where his pictures gained him the name of *Il Giovane de' paesi* (the young man of the landscapes). His great picture of the "Resurrection of Lazarus" established his fame. As superintendent at the Vatican, he developed mosaic as a perfect imitation of painting. He helped to found the Academy of St. Luke in Rome.

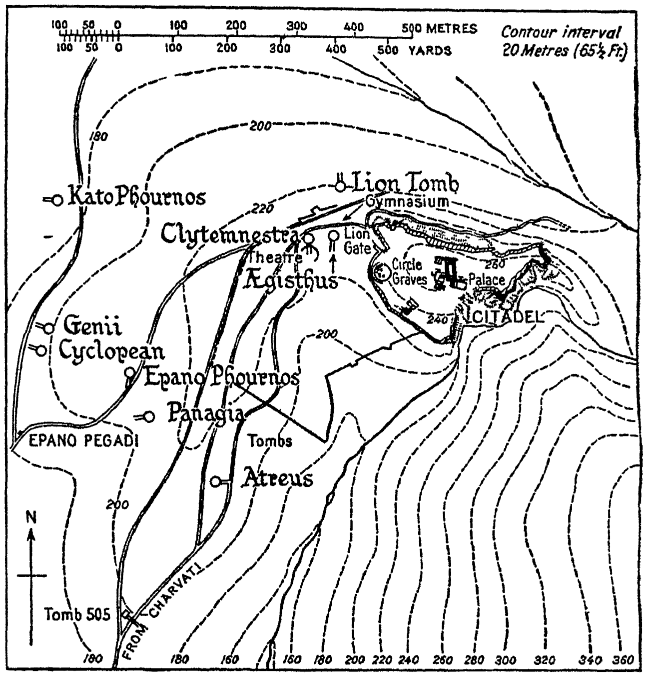
Many of Muziano's works are in the churches and palaces of Rome; he also worked in Orvieto and Loreto. In Santa Maria degli Angeli, Rome, is one of his chief works, "St. Jerome preaching to Monks in the Desert"; his "Circumcision" is in the church of the Gesu, his "Ascension" in the Araceli, and his "St. Francis receiving the Stigmata" in the church of the Conception. A picture by him representing Christ washing the feet of His disciples, is in the cathedral of Reims.

MWERU (or MOERU), a large lake of eastern central Africa. It lies 3,000 ft. above the sea, in a western branch of the great Tanganyika rift-valley. The lake is about 68 m. long by some 25 in breadth, and is roughly rectangular. It is cut a little south of its centre by 9° S. Mweru, first visited in 1798 by Dr. Lacerda, was reached by Livingstone in 1867, but its western shore was first explored in 1890 by Sir Alfred Sharpe, who two years later circumnavigated the lake. The eastern shores belong to Northern Rhodesia, the western to the Belgian Congo. The district is a game preserve and shooting is prohibited.

MYCENAE, one of the most ancient cities of Greece. The citadel on the summit is triangular with sides facing north, south-east and south-west. Part of the south-eastern wall and the palace within have been undermined by the torrent which bounds the lower town on the east. For the artistic significance of the various graves and building remains scattered among the groups of houses forming the lower town, *see* AEGEAN CIVILIZATION. Mycenae is a natural rock citadel standing in the north corner of the Argive plain flanked to north and south by deep ravines. It watched the hills, controlled the plain, and was the key to the road from the Gulf of Argos to the Gulf of Corinth which afforded the shortest route from Crete to central Greece.

The hill is roughly triangular with the apex pointing south and is defended by massive cyclopean walls. At the northwest angle is the Lion Gate surmounted by the famous limestone relief of two confronted lions ten feet high. The gate itself is about ten feet square and with its approaches is built of ashlar masonry in hard conglomerate. In the north wall is a smaller but similar gate and near it lies a secret underground cistern fed by the Perseian spring and approached by a subterranean passage from inside the walls. The extreme northeast angle is a later addition to strengthen this important point and to provide a sally port. Within the Lion Gate lies the Grave Circle enclosing the Royal Graves found by Schliemann and by it are ruined houses and storehouses. From the gate an inclined roadway leads to the summit crowned by the palace. This was built at different periods, but the ruins now visible belong in the main to the last great age of Mycenae. At the northwest angle was a columned entrance porch, and a throne room, a shrine, a bathroom, and a room with store jars have been found. On the south a wide staircase with two flights ascends to a spacious court. To the east a porch and vestibule open into the great hall (*megaron*) in the centre of which is a large circular hearth covered with painted stucco and surrounded by four column bases. The walls and floors of the *megaron*, court and vestibule were covered with painted stucco and there are plentiful remains of frescoes which adorned other rooms at different periods. West of the court a staircase led to the upper stories and to its north ran two parallel corridors giving access to other rooms at higher levels.

From the citadel a narrow ridge runs westwards so that its backbone forms the natural approach to the Lion Gate. Here are three of the beehive tombs (the Tomb of Aegisthus, the Lion Tomb, and the Tomb of Clytaemestra) and also the north wall of the Hellenistic lower town and the ruins of its gymnasium and theatre. At its west end a wider and longer ridge runs due south. Its northern end was included in the Hellenistic lower town and somewhere along it must have run the prehistoric road. On its east side stands the Treasury of Atreus, the largest beehive tomb, and on its west another, and all about are rock cut chamber tombs. Below its southern extremity the ravine which runs from the south side of the citadel was spanned by a prehistoric bridge on the road leading southeast towards the Argive Heraeum and Tiryns. Sub-



PLAN OF THE CITADEL OF MYCENAE

sidiary ridges running westwards to the plain are also honeycombed with tombs among which are four more beehive tombs. On one ridge, Kalkani, traces of early Bronze Age occupation have come to light, and in the hollows are two ancient wells. On the peak of Hagios Elias which overlooks Mycenae to the north stands a small fort of the later part of the Third Bronze Age which clearly served as a signal station, for thence the whole plain can be surveyed from Asine to Argos with the passes towards Arcadia, Nemea and Cleonae and the Acrocorinthus itself can be seen. A system of built roads radiates through the hills from Mycenae and they and the signal station emphasize its strategic and political importance.

Argolis was inhabited in the Neolithic age by a branch of the race that occupied central and northern Greece. No settlement of this period has yet been found at Mycenae, whose history begins with the Bronze Age. Then the citadel was occupied by the bronze using folk of the Early Aegean period who seem to have come into Greece from the islands and southwest Asia Minor. There is no clue to the language of the neolithic race, but the Bronze Age people probably spoke a non-Hellenic tongue and brought into Greece the place names which end in -nthos, -assos, or -ene. Among these is Mykene, a heroine mentioned by Homer whose name is to Mykenai as Athene is to Athenai. It is hard to estimate either the date of the Bronze Age settlement, which probably existed before the third millennium B.C., or its size, for ceramic remains, though frequent, are much disturbed by later buildings. With the beginning of the Middle Aegean period soon after 2200 B.C. a new racial element of unknown origin entered Greece. Its presence is marked by a class of pottery called Minyan Ware which has several varieties. The plentifulness of this and of a matt painted fabric, developed from the Early Bronze Age pottery at Mycenae, shows that the city prospered under this new impulse. As Minyan ware is practically unknown in Crete, though common in the islands, relations between Crete and Mycenae cannot have been intimate, and so the latter's expansion would have been mainly independent of Crete. Through-

out the Middle Bronze Age, on the hillside where the Grave Circle and Lion Gate were afterwards built, a cemetery had been in use, as this was the nearest spot where the rock was soft enough for simple cist graves of the type usual at the period. Among them in one special area larger and deeper graves were hewn out to contain the remains of the princes, the famous Shaft Graves, the treasures of which, excavated by Schliemann, first revealed the great prehistoric civilisation of Greece. The earliest, the Sixth, contains some objects from Crete, but the bulk of its pottery is unmistakably indigenous.

This Shaft Grave Dynasty rose to power about 1600 B.C. almost coinciding with the establishment of the 18th Dynasty in Egypt and the renaissance of Knossos after its destruction towards the end of the Middle Bronze Age. Slight signs of Cretan influence appear shortly before, but now at the beginning of the Late Bronze Age Cretan fashions and art were largely adopted at Mycenae. Three explanations are possible: (1) that Cretans now conquered the mainland and displacing the native population colonized a large portion; (2) that Mycenaean kings, strong on land and sea, successfully raided Crete, bringing home rich treasures and craftsmen as slaves; (3) that the kings of Mycenae grew powerful and rich, entered into relations with Crete and absorbed its culture. The first view seems least probable because for one reason Cretan pottery of the date of the alleged conquest is extremely rare at Mycenae where local fabrics still continued. Which of the other two is more correct time alone can show. The "Crétoiserie" of the Shaft Grave kings can be compared to the European *Chinoiserie* of the early 18th century, which was not the result of a Chinese conquest of Europe. These kings undoubtedly resided on the summit of the citadel where there are traces of a "palace" underlying the later palace. No signs of a circuit wall have yet been found and in any case it would not have had the area of the later enceinte. Still the richness of the royal graves and of private tombs of the period shows that a high standard of civilisation had been reached. This was not due entirely to the adoption of the Cretan culture, but to the fact that the newcomers of the Middle Bronze Age, who may well have spoken Greek, were themselves keen, energetic, and well advanced in things material, and needed only the contact with Crete to develop artistically as well.

Towards the close of the 16th century B.C. a change in royal burials indicates a new dynasty, which laid its princes in stone built beehive tombs from 25 to 50 feet in height and diameter. Nine such tombs exist at Mycenae. Their architecture displays gradual advance in technical matters, the use and cutting of materials and the handling of the problems of stresses and weights, so that they fall by progressive development into three groups of three tombs each. The first group belongs to the later 16th and to the early 15th century B.C. and the second group to the later 15th century. The earlier tombs were smaller, the construction primitive, the material inferior, the stone unshaped, and stresses not understood. The second group is larger and better built, the stone was hewn but not sawn, and a relieving triangle over the lintel was employed. In the two first groups the finest are the Tomb of Aegisthus and the Lion Tomb which last was closed with a door and threshold instead of rude stone walling. The first Beehive Tomb kings must have lived in the citadel but, apart from signs of their activity in the palace area, no other building can be definitely assigned to this date. The standard of culture was the same and there was intercourse with the islands, Crete and Egypt. The private tombs show that comfort was extending and the rather simple rock cut tombs of the 16th century now developed into spacious chambers with wide entrances.

After 1400 B.C. when Knossos fell and Egypt decayed under the last Amenhoteps, Mycenae, which had been rapidly developing since the end of the Middle Bronze Age, now took first place. Greek traditions, Homer's picture of Agamemnon as suzerain of the princes who sailed against Troy, and its mighty ruins, all bear witness to its greatness. Under the aegis of Mycenae ruled by the later kings of the Beehive Tomb Dynasty the Minoan-Mycenaean culture spread throughout the Eastern Mediterranean, and echoes of this are found in Homer. To this great age the majority of the amazing buildings at Mycenae belong. The palace was reconstructed on a large and sumptuous scale, the cyclopean walls of the citadel were built with the Lion Gate. Within the walls rose storehouses and residences for the civil and military officers of the court, and for their guards and servants. The royal Shaft Graves with part of the old cemetery were enclosed within the enceinte and the space round them was levelled, ringed with standing slabs, and made into a sacred area for the worship of the dead princes.

These later kings of the Beehive Tomb Dynasty to whose energy and ability the greatness of Mycenae seems so largely due, were buried in the last group of Beehive Tombs, the Treasury of Atreus, the Tomb of Clytaemestra, and the Tomb of Genii. These are naturally the best in construction, plan and size, and are built throughout of hard stone, mainly sawn. Each had a door, and a threshold constructed on a wedge principle. The understanding of stresses and of the means to counteract them shows that their architects profiting by earlier experiments perfected their methods and materials, so that two of these tombs still stand almost intact. The Treasury of Atreus is structurally so like the Lion Gate and the palace that it is possible that the royal builder of the two latter prepared the former as his tomb. The same style occurs in the walls and palace at Tiryns which are contemporary. The civilian population of Mycenae must have lived in undefended settlements on the neighbouring hills and the many cemeteries of this date divide into local groups suggesting separate communities. The tombs are carefully hewn in the rock with long narrow entrance passages and were furnished with objects in pottery, bronze, glass, ivory and gold, which show that the culture of Mycenae at its zenith even if less artistic displays wonderful technical ability. During the 14th and 13th centuries B.C. at Mycenae not only were crafts such as the potter's intensively and skilfully practised, but also professions such as those of engineers and architects, for the cyclopean walls and great domes like the Treasury of Atreus imply structural genius.

Troy according to tradition was taken early in the 12th century. Then, as the use of iron spread, the Iron Age began and as the contemporary Egyptian records say "the Isles were restless." This was the age of the Dorian Migration. Then Mycenae fell and the palace and houses were burnt. The walls, however, were not destroyed and as such a stronghold could not be left untenanted Mycenae was inhabited during the early Iron Age, but was of small importance as Dorian Argos usurped her place. As a small city state it preserved its independence and a Doric temple of Athena who ousted the local heroine Mykene arose early in the sixth century upon the ruins of the palace of the Bronze Age kings. Some sculptures from this temple survive. The débris among the ruins proves Mycenae's continuous existence, through the geometric, orientalising and archaic periods of Greek art down to the Persian Wars. Then Mycenae sent her small contingent to join in resisting Xerxes' invasion. Her men fought at Plataea in 479 B.C. and the name Μυκανῆς can still be read on the serpent column from Delphi now in the Hippodrome at Constantinople. Argive jealousy, however, could not forgive and in 470 B.C. when Sparta was in difficulties an Argive army besieged Mycenae. The citadel was starved out, its walls and buildings were overthrown and the site laid waste.

In 235 B.C. the Argive tyrant Aristippos was murdered at Mycenae which like other small towns dependent on Argos was probably reoccupied by the Argive tyrants of the third century B.C. during their struggles with the Achaean League. The walls of the citadel were repaired and part of the hillside on the south was walled in to make a lower town. In this lay a small theatre directly above the Tomb of Clytaemestra and by it was a gymnasium. The Doric temple, which the Argives had perhaps spared in 470 B.C., still stood on the summit of the citadel. Inscriptions dating probably from 194 B.C. and referring to Mycenae's relations with Argos and Nabis of Sparta give some details of its government. After Argos was freed from Nabis Mycenae vanishes from history and Pausanias in the second century A.D. makes no mention of inhabitation. A few remains of the Roman period have been

found so it cannot have been entirely deserted, but the depopulation of Greece must have affected Mycenae and a few inhabitants among ruins so famous would give every impression of desolation. Soon after it must have been completely deserted, for there are no traces of Byzantine or later occupation.

The site of Mycenae was never forgotten as Pausanias who saw the Lion gate shows and when Greece began to be revisited by travellers from western Europe it became a place of pilgrimage. Excavations were begun by Schliemann who made soundings in 1873, but conducted his epoch-making campaign in 1876 when he found the royal Shaft graves. Stamatakes followed from 1877 to 1879 when he found the sixth Shaft grave and cleared the Treasury of Atreus. From 1886 to 1902 Tsountas in a fruitful series of excavations cleared several houses, and found the palace, three beehive tombs and a large number of private tombs. Rodenwaldt did valuable work on the frescoes in the palace between 1912 and 1914. From 1920 to 1923 Wace excavated here for the British school at Athens, when many tombs were found and new and important results were obtained from the Grave circle, the Beehive tombs and the palace.

MYCETOZOA or **MYXOMYCETES.** The lower members of the plant and animal kingdoms approach each other so closely that it is often difficult to decide to which they belong. Among such organisms are the remarkable Mycetozoa. Literally the term means "fungus-animals," and the synonym preferred by botanists is Myxomycetes or "slime moulds," the latter being a common designation for the assemblage. While students have disagreed as to the types embraced by the name Mycetozoa, all are agreed that the rather homogenous assemblage known as the Myxogastres must be included. Indeed, since the beginning of the 20th century the tendency has been to limit the definition of the Mycetozoa to the point where it is customary to use, as does this article, either Mycetozoa, Myxomycetes, or slime moulds as synonyms for the stricter designation, Myxogastres.

The Plasmodium.—The stage in the life cycle of the Mycetozoa which has commanded most attention begins by the sexual fusion of microscopic gametes. Nuclear division commences in the amoebalike zygote, but unlike true amoebae the zygote does not split following nuclear division. Thus, with repeated nuclear divisions there is formed a creeping, jellylike plasmodium of no fixed shape, containing many nuclei. As the plasmodium grows, the amoeboid creeping is no longer feasible by the extension of a pseudopod into which the mass of protoplasm flows or which pulls the rest after it; the diffusion of oxygen to the interior, the excretion of waste and the intake of nutrients impose conditions which a rather compact amoeba can no longer meet.

Therefore, the plasmodium becomes thin and sheetlike, broken into interconnecting strands of protoplasm, and assumes a fanlike shape. The plasmodium, by the time it is easily visible to the unaided eye, has already achieved the characteristic fanlike appearance; and the fan both grossly and microscopically has distinguishable regions. The front comprises a broadly curved sheet of protoplasm, usually with a raised anterior border. Just posterior the sheet is thinner, and microscopic examination shows that it is formed of gelled protoplasm crossed by anastomosing strands of liquid protoplasm in active streaming motion. Toward the rear the sheet begins to break up into strands until the trailing end of the plasmodium is formed of a few strands, or frequently a single strand, of protoplasm.

The vivid protoplasmic streaming shown by the Mycetozoa has excited the curiosity of naturalists since it was first observed. In the strands of the plasmodium it is somewhat rhythmic, the flow being first in the general direction of the front, then slowing, coming to a full stop and reversing. The forward creeping of the plasmodium is at least in part because of the accumulation of protoplasm at the front by forward streaming. The reverse streaming does not last for so long a period as the forward flow and presumably has the function of depositing waste to the rear.

While because of its mass a large plasmodium may not change shape as rapidly as an amoeba, the shape is by no means constant. A plasmodium may reverse its direction of creeping either by turning around or by simple reversal of the main protoplasmic flow, in which case the former rear now becomes a broadly fan-shaped front. At times small secondary fans are formed which may be later resorbed, or not infrequently may finally separate from the parent. The fan shape is typical only of plasmodia on a smooth substrate in the laboratory or on the surfaces of logs, leaves and other vegetable debris. For these plasmodia which live within decaying wood the fan shape is obviously impossible, and the plasmodium is a loosely flung network through fissures, within vessels and along the tunnels of boring insects.

If a strand of a vigorous plasmodium is severed, there is an immediate welling out of the fluid endoplasm which may continue until a drop the size of a pea or larger is formed. Almost immediately there is gelation of the endoplasm at the surface which continues toward the interior, and in a few minutes the entire drop becomes a soft but firm mass. If placed on a new substrate, it forms a small plasmodium; if left in place, it is resorbed in a matter of hours.

Simultaneously with the injury, the strand usually gels for some distance on either side of the cut, so that further flow does not occur until the interior reverts to its former fluid state. The fluid-gel reversal also occurs naturally. The flowing protoplasm of a channel may come to rest and gel, while adjacent protoplasm will become fluid and begin to flow, thus creating a new channel.

Although mycetozoan plasmodia, because of their often great size, have been used frequently for studies on the physiology of undifferentiated and primitive protoplasm, the protoplasm is neither particularly primitive, undifferentiated nor more resistant to abuse than the protoplasm of more conventional cells. Rough mechanical treatment may kill part or all of the plasmodium; it may be overwhelmed by bacterial contamination; and the protoplasm of some forms is sensitive to lack of oxygen and to excessive wetting.

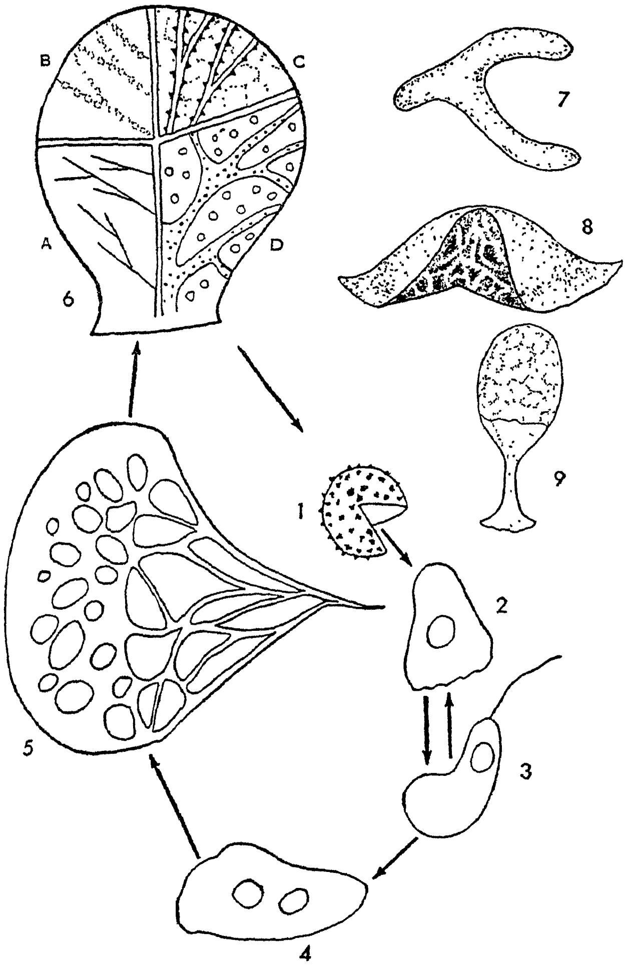
Most of the Mycetozoa are terrestrial forms which spend their vegetative existence creeping in and among damp, decaying leaves, twigs and logs. Nutrition and safety are aided by tactic behaviour—the oriented response to external conditions, such as light, moisture and food.

Negative chemotaxis is exhibited in the laboratory by movement away from stale to fresh substrates and by the avoidance of certain bacterial colonies. Positive chemotaxis is often dramatically shown toward other bacteria or fungi, as when the plasmodium of *Physarum polycephalum* envelops and digests a large mushroom down to an unrecognizable slimy mass within a day after first contact has been established.

Plasmodia from the field are often seen to be crowded with fungus spores, woody particles and other debris indicating an animal-like ingestion of particles, some of which might have nutritive value. But other data indicated that the chief mode of nutrition was saprophytic, the absorption of the dissolved products of decaying organic matter.

In 1939 it was shown that plasmodia could partially digest vegetable substrates but could not grow indefinitely upon them alone. Micro-organisms were also necessary, and indeed plasmodia could grow indefinitely solely by ingesting various killed or living bacteria or yeasts, thus making it probable that the chief mode of nutrition is animal-like.

Life History.—The plasmodium does not always remain in a fluid state of differentiation, but under ill-defined conditions it generally seeks an elevated place for fruit formation. The details of fruiting body formation differ from group to group, but usually the plasmodium breaks up into small globules which become invested with pellicles which dry into the peridium. The globules may remain sessile on the substrate or be elevated on stalks while within the sporangium the protoplasm forms tubular vacuoles, the walls of which become lined with secreted material forming a branched or network system which hardens into the capillitium. Further successive division of the protoplasm results in separa-



FIGS. 1—9.—LIFE CYCLE AND TYPES OF FRUITING BODIES IN MYCETOZOA

All figures highly diagrammatic; figs. 1–4, magnified approximately 1,000 ×; 6, 7 and 9, approximately 12 ×; 5 and 8, approximately life size. Fig. 1. —Emptied spore case from which myxameba (fig. 2) has escaped. Fig. 3.—Swimming stage (gamete) which may revert back to myxameba or fuse in pairs. Fig. 4.—Fused gametes, flagellae retracted, nuclei unfused. Fusion of nuclei and growth of zygote produces plasmodium, fig. 5. Fig. 6.—Sessile fruiting body showing stages of development: A, formation of strain lines in protoplasm which develop into chains of vacuoles; B, C, coalescence of vacuoles to form system of hollow tubes; protoplasm is cleaving into blocks from which spores are formed; D, mature fruit, granule-filled capillitium with a few spores in the meshes. Fig. 7.—Plasmodiocarp. Fig. 8.—Aethalium as in *Fuligo septica*, cut open to show black spore masses and interlacing walls of the separate, imperfect sporangia. Fig. 9.—Stiped fruiting body of *Arcyria*, showing the expanded capillitial network

tion of each nucleus with its surrounding protoplasm as a spore. Investment of the spore with a firm wall and drying of the sporangium releases the dry, microscopic spore for dissemination by wind. In some genera such as *Arcyria* and *Trichia* the capillitium plays an active role in spore dispersal. With the drying of the fructification, the peridium is burst by the elastic capillitium, spores being scattered by the sudden expansion of the capillitium and by the constant twisting of its threads with changes in the moisture content of the surrounding air.

On attaining a suitable wet environment, the spore absorbs water, nuclear division occurs and the spore wall is either ruptured or partly dissolved to release two or more swarm cells or, more frequently, an amoeboid mass which soon divides into uninucleate swarm-cells. The swarm cell of the Mycetozoa has two interchangeable phases, an amoeboid, creeping stage, in which it crawls over the substrate ingesting bacteria and other particles, and a swimming stage, in which it is comma-shaped with a flagellum projecting from the anterior, tapering end.

Since 1911 there is agreement that the swarm cells are sexual cells or gametes; prior to that time it was thought that the plasmodium was formed either by nonsexual fusion of swarmers or that nuclear fusion took place before germination of the spore. It is probable that such early concepts and some later disagreements may be because of the difference in nuclear behaviour dependent either on species or condition of plasmodial formation. The coalescence of groups of swarm cells probably results in nuclear pairing and fusion within the young plasmodium at a later period, while pairing of gametes may result either in immediate or delayed nuclear fusion. With fusion of the gametes, retraction of flagella and nuclear fusion, the plasmodium is initiated as previously described.

There are alternative resting conditions which, unlike spore formation, do not result in propagation. The swarm cell—on fouling of the medium, starvation or desiccation—may surround itself with a smooth cyst wall to await the return of favourable circumstances. Under similar circumstances the plasmodium may form a sclerotium. Microscopic examination shows that the plasmodium has divided into numerous cells, which may contain from 1 to more than 20 nuclei each. These sclerotia retain their viability when dry, viability having been recorded up to 20 years, though 3 years is the usual limit. On being moistened, the cyst walls are dissolved, the contents of the cysts coalesce and the plasmodium resumes vegetative activity.

Extent of the Group.—Approximately 500 species of Mycetozoa are known. Identification of genus and species is based on the fruit, for the plasmodia are usually very similar in appearance and of inconstant colour, the prevailing colours being yellow, orange and buff to watery white. In all genera except *Ceratiomyxa* the spores are obviously borne within fruiting bodies. In *Ceratiomyxa* the fructifications are apparently composed of pillars or ridges, with the spores borne individually on minute stalks. The researches of H. C. Gilbert, however, indicate that the so-called spores are sporangia reduced to the extreme degree where each contains one spore.

Diagnosis of family, genus and species is made, in order of importance, on the colour of the spores, the existence of a capillitium, the presence or absence of calcium carbonate granules in the sporangium wall and in the capillitium, the type of fruit and the often beautiful sculpturing of the capillitium and of the spore walls. The fruits are of several types. The individual sporangia may be sessile on the substrate or on a thin horny sheet, the hypothallus, or raised on a stalk. Some species fruit without breaking up into individual sporangia, the fructifications, called plasmodiocarps, resembling more or less completely the strands of the plasmodium. The aethalium is a type of fructification consisting of fused individual sporangia or of plasmodiocarps. In some cases the walls of the separate sporangia comprising the aethalium may be reduced to threadlike remnants resembling the capillitium and known as a pseudocapillitium.

Field observations and laboratory cultivation indicate that fructifications derived from a single plasmodium may vary greatly in type, depending on external conditions at the time of sporangium formation. Thus, the author has found the well-known *Physarum polycephalum* fruiting as plasmodiocarps and as sessile sporangia as well as the typically stalked forms with convoluted sporangia.

Other Groups Sometimes Included with the Mycetozoa.—The Acrasieae (or Sorophoreae) constitute a remarkable group of organisms which engage in communal encystment. The vegetative stage is passed as small individual amoebae indistinguishable from the many other small amoebae which inhabit the soil and decaying vegetable matter. The vegetative period is also the period of reproduction by fission, a sexual cycle not being established for the group. At the completion of the vegetative period the amoebae creep toward a common centre, the converging streams of their closely packed cells recalling the strands of a plasmodium; and therefore this stage is known as a pseudoplasmodium. The pseudoplasmodium becomes more compact, and in the lower forms all the individual amoebae encyst, to be scattered by wind or rain as a prelude to excystment and commencement of the vegetative stage. In the higher forms, such as *Polysphondylium* and *Dictyostelium*, the cells comprising the pseudoplasmodium become differentiated, some of them being sacrificed to form the vacuolated, polygonal cells of the stalk and branches

(sorophores), on which are borne the heads of cysts (sori). In the highly developed *Dictyostelium discoideum* the entire pseudoplasmodium migrates as a unit before fructification. For an account of this remarkable group the reader is referred to the papers of Kenneth Raper.

The Labyrinthulae is a group very imperfectly known and with certainty containing only the type genus, *Labyrinthula,* whose species are all parasites of aquatic plants, one being the cause of an economically important disease of eel grass (*Zostera marina*). The characteristic structure of *Labyrinthula* is the net-plasmodium, which unlike the true plasmodium of the Myxomycetes, shows only partial fusion of the individual cells. The spindle-shaped bodies are connected to each other by a network of slender extensions along which they move with relation to each other. Prior to 1929 it was generally believed that these strands were pseudopodial extensions, but work since that date indicates that they may be nonliving tubes or threads along which the spindles glide. The life cycle is still very obscure, only vegetative division and cyst-formation having been observed.

The Plasmodiophoreae in some respects approach most closely the Mycetozoa in life cycle and in morphology. The vegetative state is a plasmodium, parasitic in higher plants, which eventually breaks up into spores. On being freed from the host, and on germination, these spores produce anteriorly flagellate swarm cells which gain access to the host through the root hairs. There is little agreement on the details of the life cycle, but there is reasonable agreement that these swarm cells are gametes, and on fusion initiate the plasmodium either immediately or after an intermediate stage.

Relationships.—Forming, as they do, small fruiting bodies resembling those of the higher fungi, it is understandable that for a very long time the Mycetozoa were supposed to be a division of the Gasteromycetes, hence the name Myxogastres. Not until the classical work of Heinrich Anton de Bary was it made clear that these forms were not to be grouped with the highly specialized puff balls, but instead were related to very primitive forms resembling both plants and animals.

In some respects the Mycetozoa resemble the lowest fungi—the chytrids, some of which may spend a large part of the life cycle without a firm cell wall. In other respects, they recall strongly the amoeboid-flagellate line with its borderline members such as the flagellate amoeba, *Mastigamoeba.* A. Pascher has described the chlorophyll-bearing counterparts of the Mycetozoa, Labyrinthulae and of *Mastigamoeba,* and it is well recognized that any line drawn across the flagellates to separate plants from animals is an arbitrary one. While close relationship with the amoeboid-flagellate line is very likely, the Mycetozoa probably form an evolutionary blind alley of their own.

As to the relationships between the Mycetozoa as defined here, and the Plasmodiophorae, Acrasieae, Labyrinthulae and other curious forms such as *Vampyrella* and Proteomyxa, too little is known of the life history to group these forms together with any certainty, or else increased knowledge has widened the gulf between the Mycetozoa and some divisions formerly included with them, such as the Acrasieae.

Acrasieae.—E. Olive, "Monograph of the Acrasieae," *Proc. Boston Soc. Nat. Hist.,* vol. 30, p. 451 (1902). An exceedingly interesting and not too technical account is given by K. Raper, "The Communal Nature of the Fruiting Process in the Acrasieae," *Amer. Journ. Bot.,* vol. 27, p. 436 (1940). (A. L. Cn.)

MYCOLOGY is the science of fungi (Greek μύκης, a mushroom, λόγος, discourse), and is dealt with in the article Fungi.

MYCORRHIZA. The roots of land plants live in soil, competing therein for water and nutrients with a crowded population of microorganisms. They are surrounded by a rich and varied fungus flora many members of which are potential parasites, but the majority of roots are relatively immune to such parasitic attack and continue to flourish side by side with their fungus competitors. To the interaction of these three phenomena—the competitive struggle for food, the capacity of many fungi to penetrate living tissues and the properties of resistance to such invasion possessed by roots in common with organisms in general—is probably due the evolution of *mycorrhiza,* that curious and interesting partnership between the roots of vascular plants and fungus mycelium now known to affect a vast number of the higher plants and to be of great importance in their lives.

Mycorrhizae or fungus roots (μύκης, a mushroom) (ῥίζα, a root) are formed alike by wild and cultivated plants, by species from the high mountains and by those from salt marshes at sea level, in the vegetation of tropical forests and in that within the arctic circle. The phenomenon was comparatively well-known, especially to foresters when, in 1885, the German botanist, Albert B. Frank, coined the name, 'mycorrhiza,' to register his view that the root with its associated mycelium constituted an independent organ of great importance in plant nutrition. He reported an invariable and intimate association of fungus mycelium with the roots of forest trees, especially oak, beech, hornbeam and other members of Cupuliferae, and certain conifers, such infection being, in his opinion, not parasitic but of definite service to the trees in relation to the absorption of water and nutrient salts. On a contemporary view associated especially with the name of Robert Hartig, the root fungi of trees were mischievous parasites hindering root action and conferring no benefit upon the hosts.

By the end of the 19th century it was realized by botanists that the mycorrhizal habit was widespread, affecting not only trees but an immense number of herbaceous species belonging to different families.

Distribution and Structure.—Mycorrhiza is formed by ferns, club mosses, conifers and an ever growing list of flowering plants belonging to many different families. It is constant and conspicuous in certain groups, *e.g.,* Orchidaceae, Ericales, Empetraceae and forest trees generally, and is invariably well developed in species lacking chlorophyll, e.g., *Neottia Nidus-avis, Corallorhiza* spp. and a number of tropical orchids belonging to this class, members of the Monotropoideae, and certain species belonging to the families Gentianaceae and Burmanniaceae. Structures closely resembling the mycorrhizal tissues of living species have been described in fossils of Coal Measure age. It is specially characteristic of the vegetation of humus soils, viz., those of moorlands, woodlands and heaths, but may be well developed in garden soil and in the most diverse situations elsewhere. It may be regarded as an annual phenomenon affecting all or a proportion only of the young absorbing roots of the current year.

It is assumed that the fungi concerned are widely distributed in soil, and with few exceptions invasion of the roots takes place from this source. The effect of infection is strikingly different from that in ordinary parasitism, there being no indication that the tissues suffer any permanent injury from the more or less extensive infestation by mycelium to which they are subjected. The external appearance of the root may be altered, as in trees, where arrest of growth accompanied by profuse branching results in the production of dense clusters of rootlets, brown or variously coloured according to the kind of mycelium present. Sometimes the appearance of the roots is not altered in any way. There is great variation in different plants and at different seasons in

respect to the relative abundance of mycelium, its distribution upon and within roots and the details of structure of individual mycorrhizas.

It is still convenient to recognize two main types of structure and use the descriptive names given to them by Frank in 1885; the *ectotrophic* type, specially characteristic of trees, in which mycelium completely invests the tip and younger portion of the root as with a sheath of varying thickness, branches from which penetrate between the cortical cells to form a continuous network, while individual cells remain relatively immune from infection; and the *endotrophic* type, showing a variable amount of mycelium externally without formation of a sheath, combined with a more or less profuse distribution of hyphae within the cells, sometimes irregularly distributed in the cortical tissues, sometimes localized in definite zones. The individual cells that suffer invasion become filled with coiled or branched hyphae continuous with those which form an irregular mesh upon the external surface of the root and permeate the soil around it. In a majority of fungus roots these intracellular hyphal complexes disintegrate, dwindle and disappear, the soluble by-products presumably passing to the host cells.

These two types of mycorrhiza are not sharply distinguished from one another as Frank believed. It is known now that those of the ectotrophic type often exhibit relatively heavy infection of individual cells, and it seems probable that the structural differences are related to the character of the mycelium and to soil conditions rather than to any fundamental distinction in the association as a whole.

The Mycorrhiza of Orchids.—The mycorrhiza of orchids is of the endotrophic type and mycelium may be widely distributed throughout the root cortex or confined to certain regions. Two contrasting types of cell are observable: *Pilzwirthzellen* or "host cells," containing active hyphae, and *Verdauungzellen* or "digestion cells," enclosing only their disintegrated remains subsequent to digestion. In the former the mycelium fills the cells with skeins or "pelotons" of characteristic appearance and probably abstracts nutrient materials from the host; in the latter these substances and possibly others brought in from the soil are placed at the disposal of the root.

The researches of a French botanist, Bernard, initiated a new method of experimental inquiry and demonstrated the far-reaching character of the relationship in orchids. The difficulties experienced by growers in germinating seeds of orchids had long been known. Bernard isolated the root fungi from a number of species and showed, by "pure culture" methods, that germination of seed and development of the seedling are bound up with infection by the appropriate root fungus at a critical stage of development. In nature, this symbiotic type of germination is ensured by the presence of mycelium of the root fungus in the soil about the roots of the parent plant; in horticultural practice, artificial cultures have been successfully utilized by L. Knudson for the same purpose. It has been discovered that the stimulus normally provided by the appropriate fungus can be replaced artificially by carefully adjusting the chemical constitution and reaction of the seedbed, and such asymbiotic methods of securing germination have been successfully applied by horticulturalists in the case of certain orchid species.

There remains much that is obscure in the relation of fungus and host in this group of plants. The nature of the problems awaiting solution is sufficiently indicated by the invariable association of particular fungus strains with individual orchid species, and by the fact that orchid growing is concerned not only with the cultivation of natural species but with the raising of new hybrids.

Mycorrhiza in Ericaceae.—In northern Europe certain members of the family Ericaceae, *e.g.*, various kinds of heath (*Erica* spp.), and heather or ling (*Calluna vulgaris*) are a constant feature of the vegetation of humus soils—moorland and woodland—on which they often monopolize large areas to the almost complete exclusion of other plants.

Described by Frank as obligate mycorrhiza plants, it was early recognized that members of this group might exhibit specialized relations with their root fungi. The mycorrhiza is of the endotrophic type with certain characteristic features, in some respects showing points of resemblance with that of trees. The young roots are excessively fine, the outermost layer of cells in each forming a definite mycorrhizal zone. In favourable soil conditions practically every cell in this layer is filled with a densely branched complex of fungal hyphae from which strands of mycelium extend outwards into the soil. The growth of mycelium on the outside of the roots is rather more profuse than in orchids and, in certain species, may resemble the sheathlike condition found in ectotrophic mycorrhizas. As in orchids, the complexes of mycelium within the root cells are subject to rapid and complete digestion followed by disappearance of the resulting products.

In ling (*Calluna vulgaris*) and certain allied species an obligate relation unique of its kind has been revealed by experimental research. In these plants the mycelium which infests the root spreads throughout the tissues of the vegetative shoots, flowers and fruits reaching eventually the seed coats of the developing seeds. These are shed bearing with them the mycelium of the fungus partner and at germination the emerging seedling is immediately subject to invasion.

The distribution of mycelium throughout the plant thus compares sharply with that found in orchids where it is limited to the roots of the adult and the embryonic tissues of the seedling. In *Calluna* and kindred ericaceous species it is practically coextensive with the plant tissues. Only the embryo and endosperm of the resting seed are free from contamination; at all other stages of development and throughout its vegetative existence every plant of ling yet examined is a dual organism. In the genus *Vaccinium* the intimacy of the relation has been carried a stage farther and mycelium is present, not only externally upon the seed coats, but internally throughout the tissues of the seed. The mode of infection observed in Ericaceae is unique, for, in all other known cases, the mycelium responsible for forming mycorrhiza enters the root from the soil.

In ling and probably in allied species the formation of functional mycorrhiza is closely related to soil conditions. It is at a maximum in peaty soils and in cultivated soils with abundant humus, much less conspicuous in sandy soils deficient in organic matter, and may appear to be absent under certain conditions, although roots are never free from fungus infection.

Since seedling development follows and depends upon invasion by fungus mycelium at germination, it is impossible to provide experimental evidence bearing on the behaviour of individuals with and without fungus infection.

The Mycorrhiza of Trees.—The mycorrhiza of trees is characteristic and easily recognized. Structurally, it belongs to the ectotrophic type; each rootlet is enveloped in a sheath of mycelium formed by the close interweaving of hyphae continuous internally with a branch system penetrating between the cells of the roots, externally with the network of mycelium in the soil.

Woodland soils possess an unusually rich and varied fungus flora among which members of the great group known as Hymenomycetes are conspicuous, as evidenced by the profusion of their spore bodies—toadstools—produced during suitable seasons. So constant is the association of some of these with certain trees that it has been said that they follow the latter "as the dolphin follows the ship."

In order to prove a direct relation between these common woodland fungi and the mycorrhiza of the trees beneath which they grow, it was necessary to isolate the endophytes, learn something of their behaviour and compare the growth of young trees with and without mycorrhiza. By such means a number of Hymenomycetes have been identified as the specific root fungi of pine, spruce, larch, birch and other trees.

There is no evidence that seedling development is bound up with fungus infection or that anything in the nature of an obligate relation exists. As regards the effect of tree mycorrhiza on nutrition, it must be noted that woodland soils possess certain definite characteristics. There is severe competition for water and salts and they show a notable deficiency of certain plant nutrients, in particular nitrates. On the other hand, they possess

large reserves of nitrogen in the form of organic compounds. It has been proved experimentally that the possession of mycorrhiza is beneficial to trees, especially in relation to the supply of nitrogenous nutrients. Hence, the supply of nitrates being deficient it may be concluded that it possesses a vital significance for trees and other plants growing in woodland soils. The application of these conclusions to natural conditions raises problems of great importance to practical foresters.

Identity of Mycorrhizal Fungi.—It may be assumed that the fungi responsible for forming mycorrhiza are widely distributed in soil. Their systematic position is known only in those forms which have been isolated and grown in "pure culture" outside the root.

The root fungi of orchids are generally recognized as belonging to a common group, sometimes included in the well-known genus *Rhizoctonia,* sometimes placed in a new genus *Orcheomyces.* The mycelium must be locally present about the roots of wild orchids but nothing is known as to its wider distribution.

The mycorrhizal fungi of *Calluna* and other ericaceous species have been isolated and included in a single species of the genus *Phoma, P. radicis.* The specialized strains associated with different ericaceous species are distinct and must be locally distributed in heath and moorland soils but there is no certain knowledge of their wider occurrence.

The fungi definitely identified with the mycorrhiza of trees belong to the genera *Boletus, Amanita, Cortinarius, Lactarius, Russula* and *Tricholoma.* It is probable that many others will prove to belong to the same category.

Outside these specialized groups, the fungi responsible for mycorrhiza formation still await identification. The mycelium present in a large number of herbaceous flowering plants, certain ferns and club mosses, is uniform in type and produces characteristic structures: round or pear-shaped swellings or *vesicles,* variously regarded as organs relating to spore formation or to the storage of reserves, and intracellular branch systems first described by Gallaud in 1905 under the name of *arbuscules.* Following upon digestive activity in the host cells the latter disintegrate to structureless masses named *sporangioles* before their true nature is recognized. The fungus responsible for this widespread type of mycorrhiza has hitherto resisted all attempts at isolation and nothing is known with certainty as to its systematic position.

It has been reported that the mycorrhiza of many herbaceous plants is of dual character, involving primary infection by a fungus with the characters just described followed by secondary infection by one of the type associated with orchid roots. Whether this reported "double infection" is of biological significance is at present unknown.

Role of Mycorrhiza in Plant Growth.—There can be little doubt that the mycorrhizal habit had its origin in parasitic attack on the part of certain soil fungi, or that existing mycorrhiza plants are the survivors of a long and perilous evolutionary history. Many must be regarded as cases of compromise fluctuating between an almost complete resistance to fungus invasion and a remarkable toleration of the same. That there is an exchange of nutrient material in practically all cases can hardly be doubted but, in the absence of information based on the behaviour of individuals with and without mycorrhiza, attempts to express the shifting relationships in terms of mutual advantage or the reverse are premature and often misleading.

In certain groups of plants mycorrhiza has become a regular feature in the life history, a condition of delicately balanced equilibrium between fungus and host has been established and critical experimental study has placed certain facts beyond doubt. In both orchids and heaths the normal development of the seedling is bound up with the presence and activities of mycorrhizal fungi showing marked adaptation to individual species, accompanied in members of Ericaceae by a distribution of mycelium throughout the tissues so extensive that it is difficult to conceive of the individual plant as other than a single entity of double constitution. In orchids, the traditional view attributes a beneficial role to the root fungi based on their utilization of organic soil constituents and the wholesale digestion of mycelium that takes place subsequently in the root cells. A claim has been advanced for fixation of atmospheric nitrogen by the root fungi of several orchid species.

It may safely be concluded that mycorrhiza possesses a vital significance for trees and other plants growing in woodland soils, and there is reason to believe that the reaction and constitution of the soil are important factors in promoting its healthy development and functioning. In the Ericaceae, *Calluna* and many of its allies are characteristic and abundant members of the vegetation of humus soils thus pointing to similar conclusions, while in this group there is likewise evidence that the capacity to draw indirectly upon the organic compounds in the soil humus is supplemented by the ability of the root fungi to utilize atmospheric nitrogen. In both orchids and heaths the obligate character of the association is probably confined to the seedling phase and does not extend to the adult, although in heaths infection of the roots follows directly upon that of the seedling tissues.

The older theories of beneficial symbioses in mycorrhiza were deduced from distribution and structure untested by experiment. Modern research has been marked by the application of new and more precise methods and has revealed unsuspected relationships. On the whole, it supports the view that the possession of mycorrhiza is frequently of service to vascular plants, the nature and degree of benefit depending upon the physical conditions of the environment and the character of the association in individual cases. (M. C. R.)

BIBLIOGRAPHY.—The latest and most complete treatise, including a full bibliography, is that of M. C. Rayner, *Mycorrhiza: An Account of Non-pathogenic Infection by Fungi in Vascular Plants and Bryophytes* (London, 1927). *See* also H. Burgeff, *Die Wurzelpilze der Orchideen* (Jena, 1909); W. B. Melin, *Untersuchung über die Bedeutung der Baummycorrhiza* (Jena, 1925); L. Knudson, "Physiological Study of the Symbiotic Germination of Orchid Seeds," *Bot. Gaz.*, vol. lxxix, pp. 345–379.

MYDDELTON or MIDDLETON, **SIR HUGH,** 1st Bart., cr. 1622 (*c.* 1560–1631), was a younger son of Sir Richard Myddelton, governor of Denbigh castle, Wales.

Hugh was a successful London goldsmith, occupying a shop in Bassihaw or Basinghall street. He made money by commercial ventures on the Spanish main, being associated in these with Sir Walter Raleigh; he was also interested in clothmaking. He was an alderman, and then recorder of Denbigh, and was a member of parliament for that borough for a number of years.

In 1609 Myddelton took over from the corporation of London the projected scheme for supplying the city with water obtained from springs near Ware, in Hertfordshire. For that purpose he made a canal about 10 ft. wide and 4 ft. deep and more than 38 mi. in length, which discharged its waters into a reservoir at Islington called the New River Head. The work was completed in 1613. Myddelton also worked lead and silver mines in Cardiganshire and reclaimed a piece of the Isle of Wight from the sea.

He died on Dec. 10, 1631, and was buried at St. Matthew's, Friday street, London.

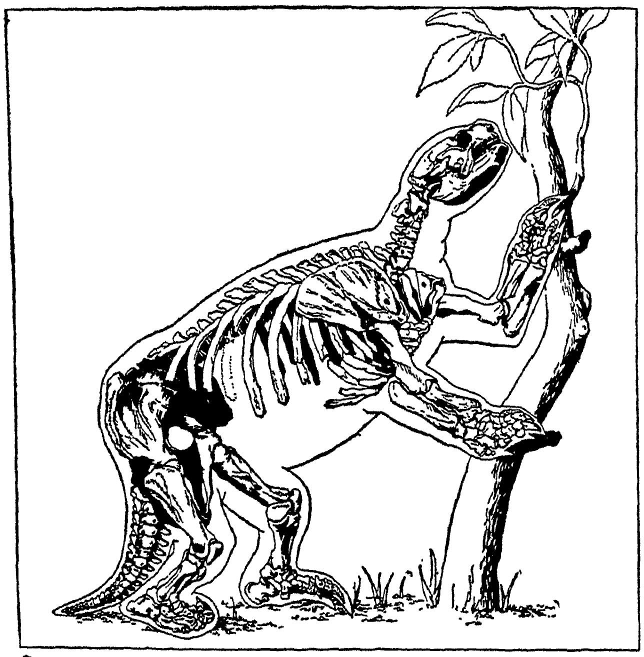
MYELITIS, from the Greek word meaning marrow, is used in medicine in accordance with the significance of the root and ending to mean an inflammation of the marrow of the bone as osteomyelitis or of the spinal cord as in poliomyelitis. A large number of descriptive adjectives are used to describe more accurately the various types of disorders involving the spinal cord. (*See* BONE, DISEASES AND INJURIES OF; NERVOUS SYSTEM; SPINAL CORD, etc.) (F. L. A.)

MYERS, FREDERIC WILLIAM HENRY (1843–1901), English poet and essayist, son of Frederic Myers, was born at Keswick, Cumberland, on Feb. 6, 1843, and educated at Cheltenham and Trinity college, Cambridge, where he was appointed classical lecturer in 1865. He had no love for teaching, which he soon discontinued, but he took up his permanent abode at Cambridge in 1872, when he became a school inspector under the education department. He published poems, for instance *St. Paul,* but is more likely to be remembered by his *Essays, Classical and Modern* (2 vol., 1883). The essay on Virgil, by far the best

thing he ever wrote, represents the matured enthusiasm of a student and a disciple to whom the exquisite artificiality and refined culture of Virgil's method were profoundly congenial. In 1882 Myers led a small band of explorers (including Henry Sidgwick and Richard Hodgson, Edmund Gurney and F. Podmore), who founded the Society for Psychical Research. He was the mouthpiece of the society, and steered a middle couse between extremes. He helped to revise the cumbrous mass of *Proceedings,* the chief concrete results being the two volumes of *Phantasms of the Living* (1886). His *Human Personality and its Survival of Bodily Death* (2 vols. 1903) was described by William James as "the first attempt to consider the phenomena of hallucination, hypnotism, automatism, double personality and mediumship, as connected parts of one whole subject." Also there was *Science and a Future Life* (1893). He died at Rome on Jan. 17, 1901, but was buried in his native soil at Keswick.

MYLIUS-ERICHSEN, LUDWIG (1872–1907), Danish explorer, was born at Viborg, Jutland, on Jan. 15, 1872. He made two notable expeditions to Greenland in 1902–04 and in 1906. The first of these yielded much valuable ethnographical information; the second provided increased geographical knowledge of the eastern coast. The explorer died as a result of the hardships he had suffered, on Nov. 25, 1907.

MYLODON, type of family of large ground sloths characteristic of the Pleistocene of the new world. *Paramylodon* was of the size of a rhinoceros, with short stout limbs, very large digging claws, five digits on each foot, but the outer ones had no claws, a broad body and massive tail. It walked on the outer edge of the sole, both fore and hind foot (compare fore foot of modern anteater). The head was rather long, with wide blunt muzzle, no front teeth, and moderately large prismatic cheek teeth, five above and four below on each side. In cross section the more anterior teeth were rounded oval, while the posterior ones were progressively larger and more elaborate, the last molar always two- or three-lobed. The skin was probably like that of the genus Mylodon itself, in which, as shown by specimens from a cave off



SKELETON OF GLOSSOTHERIUM ROBUSTUM (PLEISTOCENE, SOUTH AMERICA)

the Straits of Magellan, the skin was studded with bony ossicles and covered with heavy coarse brown hair.

Paramylodon and its ally *Glossotherium* ranged from Canada to Patagonia, and many complete skeletons have been found in Argentina, California and the central United States. A number of related genera are also found in the Pleistocene of South America. *Lestodon* has the front pair of teeth enlarged as tusks and a flaring, bell-shaped muzzle. *Scelidotherium* has a much more elongate skull, narrower body and more reduction and specialization in the toes. These with some other less known genera form the family Mylodontidae, whose ancestry can be traced back to the Miocene in Patagonia although not so well known as the related Megatheriidae. These small Miocene ground sloths come near to being ancestors of the modern tree sloths as well; they likewise approach the anteaters in various particulars and suggest a more remote affinity to the armadillos. (W. D. M.; X.)

MYLONITE, in petrology, a rock which has been crushed and ground down by earth movement and at the same time rendered compact by pressure. Mylonites are fine-grained, sometimes even flinty, in appearance, and often banded in parallel fashion with stripes of varying composition. The great majority are quartzose rocks, such as quartzite and quartz-schist; but in almost any type of rock mylonitic structure may be developed. Gneisses of various kinds, hornblende-schists, chlorite-schists and limestones are not infrequently found in belts of mylonitic rock. The process of crushing by which mylonites are formed is known also as "granulitization" and "cataclasis," and mylonites are often described as granulites, though the two terms are not strictly equivalent in all their applications. Mylonites occur in regions where there have been intense earth movements. Thrust planes and great reversed faults are often bounded by rocks which have all been crushed to fine slabby mylonites, that split readily along planes parallel to the direction in which movement has taken place. These "crush belts" may be only a few feet or several hundred yards broad. The movements have probably taken place slowly without great rise of temperature, and hence the rocks have not recrystallized to any extent.

MYMENSINGH, a town and district of British India, in the Dacca division of Bengal. The town (formerly known as Nasirabad) is situated on an old channel of the Brahmaputra, and has a station of the Eastern Bengal State railway. Pop. (1941) 52,950. The District of Mymensingh, with an area of 6,156 sq mi. and a population (1941) of 6,023,758, is the largest district in India, and its administration is an onerous charge. It occupies a portion of the alluvial valley of the Brahmaputra east of the main channel (called the Jamuna) and north of Dacca, for the most part level and open, covered with well-cultivated fields, and intersected by numerous rivers. The Madhupur jungle is a slightly elevated tract, extending from the north of Dacca district into the heart of Mymensingh; its average height is about 60 ft. above the level of the surrounding country, and it nowhere exceeds 100 ft. This tract divides Mymensingh into two distinct parts. On the west is an alluvial plain watered by the Jamuna; the eastern area is fertilized by the Surma or Meghna, the old Brahmaputra and other streams, and contains extensive marshes, which are under water for eight months in the year and are grazing grounds for cattle for the other four months. The only other elevated tract in the district is on the southern border, where the Susang hills rise. The Jamuna forms the western boundary for a course of 94 mi.; during the rainy season it expands in many places to 5 or 6 mi. in breadth. The Brahmaputra formerly flowed through Mymensingh till it joined the Meghna a little below Bhairab Bazar, but over a century ago the formation of bars of sand in the upper part of its course diverted the main volume of water into the present channel of the Jamuna. The staple crop is rice. A branch line of the Eastern Bengal State railway runs north from Dacca through Mymensingh, which is also connected with Jagannathganj and Bhairab Bazar.

MYNAH, the name given to several birds of the starling family (*sturnidae*). The Indian house mynah (*Acridotheres tristis*) is a well-known bird in the east and has been introduced into Australia and New Zealand. Somewhat larger than a thrush, with brown plumage, except for a black head and white on the wings and tail, the house mynah is easily domesticated and will learn to talk. The true talking mynah (*Gracula religiosa*) is, however, a very different bird. (*See* GRACKLE.)

MYRA (mod. *Dembre*), an ancient town of Lycia situated a short distance inland between the rivers Myrus and Andracus. Its early history is obscure. St. Paul touched Myra on his last journey westward, and changed into "a ship of Alexandria sailing

into Italy." In the 3rd century St. Nicholas, of Patara, was its bishop. Theodosius II made Myra the Byzantine capital of Lycia, and as such it was besieged and taken by Harun al-Rashid in 808. The town seems shortly afterwards to have decayed. A small Turkish village occupied the plain at the foot of the acropolis, and a little Greek monastery lay about a mile westward by the church of St. Nicholas. The latter has formed the nucleus of modern Dembre. The western scarp of the acropolis has been sculptured into a number of sepulchres imitating wooden houses with pillared façades, some of which have pediment reliefs and inscriptions in Lycian. The theatre lies at the foot of this cliff and is partly excavated out of it, partly built. The church of St. Nicholas lies out in the plain, at the western end of Dembre. Its floor is far below the present level of the plain, and until recently the church was half filled with earth. There are also extensive ruins of Andriaca, the port of Myra, about 3 mi. west, containing churches, baths and a great grain store, inscribed with Hadrian's name. They lie along the course of the Andraki river, whose navigable estuary is still fringed with ruined quays.

MYRIAPODA. A group of terrestrial Arthropoda, comprising the Chilopoda (centipedes, *q.v.*), Diplopoda (millipedes, *q.v.*), Pauropoda (*q.v.*) and Symphyla (*q.v.*). The name was originally used by Pierre Latreille (1796) to embrace the centipedes and millipedes, which, with certain Crustacea, he ranked as an order under the Insecta. Subsequently William Leach (1814) restricted the term to the centipedes and millipedes, raising the group to the rank of a class, of equal status with insects and Crustacea, the Pauropoda and Symphyla being incorporated much later.

Since 1893 a classification of Myriapoda into Progoneata and Opisthogoneata has been widely adopted among zoologists, the Progoneata (comprising Diplopoda, Pauropoda and Symphyla) having the reproductive opening near the anterior end of the trunk, while in the Opisthogoneata (comprising the Chilopoda) it is located at its hinder end. The classification is held to imply the independent descent of the two groups from a common ancestor with multiple reproductive openings, any resemblance being therefore of a fortuitous and superficial character. The remarkable anatomical characters of the Symphyla seem, however, altogether to invalidate this classification, for, as shown by A. D. Imms (1936) and O. W. Tiegs (1940), they are surely closely related to the Insecta, even though the latter are opisthogoneate.

The Myriapoda are, indeed, by no means an unnatural assemblage of animals. A. Sedgwick, who shared this view, defined them as follows: "Tracheates with numerous and similar pedigerous segments, with one pair of antennae followed by a pair of palpless mandibles, with regularly and segmentally arranged tracheal stigmata, and with malpighian tubules. The young are, with a few exceptions, not provided with the full complement of segments at hatching." (From A. Sedgwick, *Student's Text-Book of Zoology*, by permission of The Macmillan Company, publishers.) Many of these characters, he points out, are also found in Onychophora (*q.v.*) and insects, and he is led to conclude that "the classes Insecta, Onychophora and Myriapoda are the survival of a once great and continuous group of land Arthropods, a large number of which have become extinct, leaving two groups, Insecta and Onychophora, each fairly compact and showing little variety of organization, and one, the Myriapoda, loose and heterogeneous, and with considerable gaps between the orders."

(O. W. T.)

MYRICA, the only genus of the family Myricaceae, perhaps most nearly allied to the willows and birches. There are about 45 species widely distributed throughout the world. Well known representatives are the sweet-gale and wax myrtle (*qq.v.*).

MYRISTICACEAE, the nutmeg (*q.v.*) family, comprising 18 genera and 300 species, all tropical and especially numerous in Asia. They are trees or shrubs with evergreen leaves.

MYRMIDONES, in Homer, the inhabitants of Phthiotis in Thessaly. According to posthomeric legends their original home was Aegina, whence they crossed over to Thessaly with Peleus, but the converse view is now more generally accepted. Their name is derived from a supposed ancestor, son of Zeus and Eurymedusa, who was wooed by the god in the form of an ant (Gr. μύρμηξ); or from the repeopling of Aegina (when all its inhabitants had died of the plague) with ants changed into men by Zeus at the prayer of Aeacus, king of the island. As the fierce and devoted followers of Achilles, their name came to be used in modern times to mean subordinates who carry out orders implacably.

MYROBALANS, the name given to the astringent fruits of several species of *Terminalia,* largely used in India for dyeing and tanning and exported for the same purpose. They are large deciduous trees of the family Combretaceae. The chief kinds are the chebulic or black myrobalan, from *Terminalia chebula,* which are smooth, and the belleric, from *T. bellerica,* which are five-angled and covered with grayish down. There is also *Prunus cerasifera,* known as myrobalan and widely employed as stock for cherries.

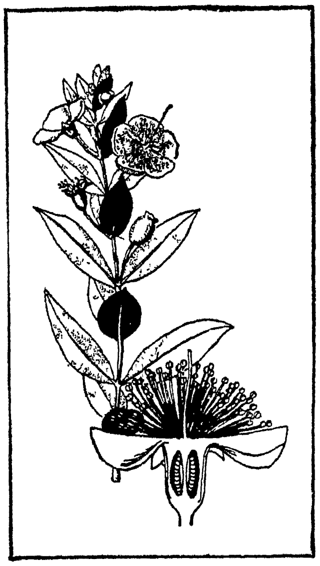
MYRRH, a gum resin (*see* RESINS), highly esteemed by the ancients as an unguent and perfume, used for incense in temples and also in embalming; it was one of the gifts offered by the Magi. True myrrh is the product of *Commiphora myrrha,* a small tree of the family Burseraceae that grows in eastern Africa and Arabia, but the name is also applied to gum resins obtained from other species of *Commiphora. Baisa bol, bhesa bol* or *bissa bol,* from *Commiphora kataf,* resembles true myrrh in appearance, but has a disagreeable taste and is scarcely bitter. It is used in China, mixed with food, to give to cows to improve the quality and increase the quantity of milk, and when mixed with lime as a size to impart a gloss to walls. Opaque bdellium produced by *C. playfairii,* when shaken with water forms a slight but permanent lather. It is known as *meena hărma* in Bombay, and was formerly used there for the expulsion of the guinea worm. African bdellium is from *C. africanum,* and like opaque bdellium lacks the white streaks which are characteristic of myrrh and bissa bol; both are acrid, but have scarcely any bitterness or aroma. Indian bdellium, probably identical with the Indian drug googul obtained in Sind and Baluchistan from *C. mukul* and *C. pubescens,* Hook, is of a dark reddish colour, has an acrid taste and an odour like cedarwood, and softens in the hand.

As met in commerce true myrrh occurs in pieces of irregular size and shape, from ½ in. to 2 or 3 in. in diameter, and of a reddish-brown colour. The transverse fracture has a resinous appearance with white streaks; the flavour is bitter and aromatic, and the odour characteristic. It consists of a mixture of resin, gum and essential oil, the resin being present to the extent of 25 to 40%, with 2½ to 8% of the oil, myrrhol, to which the odour is due.

MYRTACEAE, the myrtle or eucalyptus family, dicotyledonous trees and shrubs found in all the warmer parts of the world, especially in Australia and tropical America. There are about 90 genera and some 2,800 species, all with oil glands in the evergreen leaves. Several species yield useful timber, and *Eucalyptus* also gives oil; *Eugenia,* cloves, etc. Some have edible fruits, as *Pisidium* (guava), *Rhodomyrtus* (hill-gooseberry), various species of *Syzygium* and *Eugenia,* and *Feijoa* (pineapple guava). *Pimenta officinalis* yields allspice (*q.v.*) and *P. acris,* bay oil. (*See* EUCALYPTUS; FEIJOA; GUAVA.)

MYRTLE, the *Myrtus communis* of botanists, as now found growing wild in many parts of the Mediterranean region. It is a low-growing, evergreen shrub, with opposite leaves, varying in size, but always small, simple, dark-green, thick in texture, and studded with numerous receptacles for oil. When the leaf is held up to the light it appears as if perforated with pinholes owing to the translucency of these oil cysts. The fragrance of the plant depends upon the presence of this oil. Another peculiarity of the myrtle is the existence of a prominent vein running round the leaf within the margin. The flowers are borne on short stalks in the axils of the leaves. The fruit is a purplish berry, enclosing very numerous minute seeds. Many varieties are in cultivation. The typical species is quite hardy in the south of England. The Chilean guava (*M. ugni*), a shrub with ovate, dark-green leaves and white flowers succeeded by globular red or black glossy fruit

with a pleasant smell and taste, is a greenhouse shrub, hardy in southwest Britain. The common myrtle is the sole representative in Europe of a large genus (100 species) which has its headquarters in extra-tropical South America, while other members are found in Australia and New Zealand. The genus *Myrtus* also gives its name to a very large family, Myrtaceae (*q.v.*). Myrtle is also used for the bog myrtle (*see* SWEET-GALE), the crape myrtle (*Lagerstroemia indica*), the sand myrtle (*Leiophyllum buxifolium*), the creeping myrtle (*Vinca minor*) and many others.



MYRTLE (MYRTUS COMMUNIS), SHOWING FLOWERING BRANCH AND VERTICAL SECTION OF FLOWER

MYSIA, a district of northwest Asia Minor, bounded by Lydia and Phrygia on the south, by Bithynia on the northeast, and by the Propontis and Aegean sea on the north and west. Its precise limits are difficult to assign, the Phrygian frontier being vague and fluctuating, while in the northwest the Troad was sometimes included in Mysia, sometimes not.

The most important cities were Pergamum (*q.v.*) in the valley of the Caicus and Cyzicus (*q.v.*) on the Propontis. But the whole seacoast was studded with Greek towns, several of which were places of considerable importance; thus the northern portion included Parium, Lampsacus and Abydos, and the southern Assus, Adramyttium, and farther south, on the Elaitic Gulf, Elaea, Myrina and Cyme.

Ancient writers agree in describing the Mysians as a distinct people, like the Lydians and Phrygians, though they never appear in history as an independent nation. That they were kindred with the Lydians and Carians, is attested by their common participation in the sacred rites at the great temple of Zeus at Labranda, as well as by the statement of the historian Xanthus of Lydia that their language was a mixture of Lydian and Phrygian. Strabo was of opinion that they came originally from Thrace (*see* BITHYNIA), and were a branch of the same people as the Mysians or Moesians (*see* MOESIA) who dwelt on the Danube. The Mysians appear in the list of the Trojan allies in Homer; the first historical fact we learn is their subjugation, together with all the surrounding nations, by Croesus of Lydia. After the fall of the Lydian monarchy they remained under the Persian empire until its overthrow by Alexander; they continued to form a part of the Syrian monarchy until the defeat of Antiochus the Great (190 B.C.), after which they were transferred by the Romans to the dominion of Eumenes of Pergamum. After the extinction of the Pergamenian dynasty (130 B.C.) Mysia became a part of the Roman province of Asia.

See J. A. R. Munro in *Geogr. Journal* (1897, Hellespontica); W. von Diest, *Petermanns Mitth.* (Erganzungsheft 94, Gotha, 1889; Pergamene). *Cambridge Ancient History*, vol. iii (with bibliography).

MYSLOWICE (Ger. *Myslowitz*), a town of Poland on the river Przemsa. It is 120 mi. S.E. of Breslau by rail and an important railway junction. Pop. (1931) 22,943. It became a town in 1857 and is in an industrial area with coal mines, flax spinning and brick making. Germany took it in 1939.

MYSORE, a native state of southern India, almost surrounded by the Madras presidency, but in political relations with the governor-general. It is naturally divided into two regions of distinct character—the hill country called the Malnad, on the west, and the more open country known as the Maidan, comprising the greater part of the state, where the wide-spreading valleys and plains are covered with villages and populous towns. The drainage of the country, with a slight exception, finds its way into the Bay of Bengal, and is divisible into three great river systems—that of the Kistna on the north, the Cauvery on the south, and the Northern and Southern Penner and Palar on the east. Owing to either rocky or shallow beds none of the Mysore rivers is navigable. The main streams, especially the Cauvery and its tributaries, support an extensive system of irrigation by means of channels drawn from immense dams (*anicuts*), which retain the water at a high level and permit only the overflow to pass down stream. The streams are embanked to form reservoirs or tanks.

Mysore is a very prosperous state. Situated on a healthy plateau, it receives the benefit of both the southwest and northeast monsoons, which, in conjunction with its irrigation system, has brought it a large degree of immunity from famine. The silk industry and gold mining are very profitable, and two sandalwood-oil factories have recently been opened. Manganese, mica and steatite are worked. The famous Kolar gold fields are worked by electric power, which is conveyed for a distance of 92 mi. from the Cauvery falls. A long period of administration by British officers led to the introduction of a system based on British models, and the state has developed rapidly in recent years. Departments of industry and commerce and of agriculture have been organized, welfare work for the agricultural population undertaken, a public health institution started, and a university opened at Mysore. There is an agricultural college, and several experimental farms.

The total area of the state, including the civil and military station of Bangalore, is 29,458 sq.mi., subdivided into 8 districts, namely: Bangalore, Kolar, Tumkur, Mysore, Hassan, Kadur, Shimoga and Chitaldrug. Pop. (1941), 7,329,140. The influenza epidemic of 1918 was very serious in the state. Kanada is spoken by the majority of the people, $\frac{3}{4}$ of whom are engaged in agriculture. The proportion of Hindus, who are 16 times as numerous as the Mohammedans, shows how ineffectual was the persecution of Hyder and Tippoo. Of 87,538 Christians, over 55,000 are Roman Catholics. The finances of the state have been successfully managed under native rule, assisted by large profits from railways and gold-mines. The revenue amounts to about £2,278,000, largely derived from land, and a subsidy and peshkash of £233,333 is paid to the British government. The state maintains a military force, which numbered 2,780 in 1925. A representative assembly has been in existence since 1881. In 1923 it was placed on a statutory basis, its powers extended, and the franchise widened. There is also a legislative council of 50 members, 30 nonofficial and 20 official.

History.—In the earliest historical times the north of Mysore was held by the Kadamba dynasty, whose capital, Banawasi, is mentioned by Ptolemy; they reigned during 14 centuries, though later they became feudatories of the Chalukyas (*q.v.*). The Cheras were contemporary with the Kadambas, and governed the southern part of Mysore till they were subverted by the Cholas in the 8th century. Another ancient race, the Pallavas, held a small portion of the eastern side of Mysore, but were overcome by the Chalukyas in the 7th century. These were overthrown in the 12th century by the Ballalas (Hoysalas), an enterprising and warlike race professing the Jain faith. They ruled over the greater part of Mysore, and portions of the modern districts of Coimbatore, Salem and Dharwar, with their capital at Dwarasamudra (the modern Halebid); but in 1310 the Ballala king was captured by Malik Kafur, the general of Ala-ud-din; and 17 years later the town was entirely destroyed by another force sent by Mohammed Tughlak. After the subversion of the Ballala dynasty, a new and powerful Hindu sovereignty arose at Vijayanagar. In 1565 a confederation of the Mohammedan kingdoms defeated the Vijayanagar sovereign at the battle of Talikota. The most important of the petty local chiefs was the *wodeyar* of Mysore, who in 1610 seized the fort of Seringapatam, and so laid the foundation of the present state. His fourth successor, Chikka Deva Raja, during a reign of 34 years, made his kingdom one of the most powerful in southern India. In the middle of the 18th century the famous Mohammedan adventurer Hyder Ali (*q.v.*), usurped the throne. His dynasty, however, was as brief as it was brilliant, and ended with the defeat and death of his son Tippoo at Seringapatam in 1799. Krishnarajah Wodeyar, only five years old, was placed on the throne, and until he came of age in 1811 the state was under the administration of Purnaiya, the

Brahman minister of Hyder and Tippoo. When Krishnarajah took over the management of his state he received an orderly and contented principality with a surplus of two crores of rupees. Within twenty years he had driven his subjects into rebellion and involved himself and his state in heavy debt. The British government therefore assumed the administration in 1831, and placed it in the hands of commissioners. In 1867 it was determined to secure the continuance of native rule in Mysore and on March 25, 1881, Chamarajendra, Krishnarajah's successor, having attained the age of 18 years, was publicly entrusted with the administration of the state. He made over to the British a small tract at Bangalore, forming the "civil and military station," and received in return the island of Seringapatam. By the signing of the "instrument of transfer," the young maharajah, for himself and his successors, undertook to perform the conditions imposed upon him. The maharajah died at Calcutta on Dec. 28, 1894. His eldest son, Krishnarajah Wadiyar (1884–1940), succeeded him, and his widow, Maharani Vanivilas, was appointed regent, until in 1902 the maharajah was formally invested with full powers by the viceroy in person. In 1913 the "instrument of transfer" was replaced by a treaty. Sri Jaya Chamarajah Wadiyar (1919–) succeeded his uncle as ruler Sept. 8, 1940.

See B. L. Rice, *Mysore* (2nd ed., Bangalore, 1897); *Mysore and Coorg Gazetteer* (Calcutta, 1908); the annual *Administration Report* (Bangalore).

MYSORE, the capital of the state of Mysore, India, 10 mi. S.W. of Seringapatam on the Mysore State railway. Pop. (1941), 150,540. The city, which is spread over a large area, has its nucleus at the foot of the Chamundi hill, in a valley formed by two parallel ridges running north and south. The fort stands in the south of the town, forming a quarter by itself; the ground plan is quadrangular, each of the sides being about 450 yd. long. The palace of the maharaja within the fort contains the throne said to have been presented to Chikka Deva Raj by the emperor Aurangzeb. The houses of the European residents are for the most part east of the town. The residency or government house was built in 1805. The building afterwards used for the district offices was originally built by Colonel Wellesley (duke of Wellington) for his own occupation. The domed building for the public offices in Gordon park, the Maharajah and Maharani's training colleges, the Mary Holdsworth hospital, the fine new Palace offices and the law courts are conspicuous. A teaching and residential university was established in 1916, and the Mysore bank in 1913. There is also a chamber of commerce. Mysore, though the dynastic capital of the state, was superseded by Seringapatam as the seat of the court from 1610 to 1799, and in 1831, on the British occupation, the seat of administration was removed to Bangalore.

MYSTERY. It is necessary to differentiate *mystery*, Gr. *μυστήριον*, from its homophone, properly written *mistery*, late Lat. *ministerium*, a trade or craft; hence *mystery plays* (*see* DRAMA), those performed by trade-gilds. We must also set aside the Hellenistic meaning, common in modern languages, of "secret," "puzzling occurrence."

Properly, then, a mystery is a Greek rite which is kept secret (*μύειν*, to shut the mouth or eyes) from all save the initiated (*οἱ μύσται, οἱ μεμυημένοι*). These are specially prepared to have the secret revealed to them, under the guidance of a hierophant (*ἱεροφάντης*, "revealer of holy things"). According to Theon Smyrnaeus (*de util. math.*, p. 15, Hercher) there were four stages: (1) preliminary purification (*καθαρμός*); (2) communication of mystic knowledge, *τελετῆς παράδοσις*, presumably including a sort of sermon of instruction or exhortation; (3) *ἐποπτεία*, or revelation of the holy things, the central point of the rite; (4) the crowning or garlanding of the mystic, who was thus, as it were, badged as a privileged person. We know that the central revelation was something done (*δρώμενον*), not spoken, or not merely spoken; Lucian says (*de saltat.*, 15) that all mysteries included dancing. Hence it is usually, and reasonably, concluded that some sort of pageant or rudimentary sacred drama was shown.

We may now ask why the rites should be secret at all. A plausible but mistaken explanation has recently been revived by O. Kern (*Die Religion der Griechen*, i. 1926): the invading Hellenes oppressed, perhaps actually used religious persecution against, the earlier inhabitants of Greece, hence driving their cults into secrecy.

It might be urged in favour of this view that in Crete, according to Diodorus Siculus (v. 77, 3), rites similar to the Greek mysteries lay open to all and had nothing "mysterious" about them, and also that the *telesterion* or hall of initiation at Eleusis originates in Minoan-Mycenaean constructions, and Eleusis itself has a name probably pre-Greek (*cp.* A. W. Persson in *Archiv f. Religionswissenschaft*, xxi., p. 291 ff.; M. P. Nilsson, *Minoan-Mycenaean Religion*, 1927, p. 402, ff.); furthermore, that several survivals of things pre-Hellenic have been more or less certainly traced in the ritual of the mysteries, Eleusinian and other. But these considerations can hardly avail against the facts that the mystic deities include many undoubtedly Greek, as *Demeter, Kore, Ge, Aglauros*, the *Charites, Hecate*, and others; that the ritual is in the hands of noble and distinguished families, not of slaves or other remnants of a conquered population; and that a good magico-religious reason for secrecy can be given. The deities of these cults are one and all chthonian; these, however benevolent, are in their nature dangerous to approach; therefore, to avoid all possibility of disturbance at a critical time, it is but prudent to shroud the whole performance in secrecy, and keep the impure and unprepared at a safe distance.

For the student of Hellenism, the Eleusinian and Orphic ceremonies are of paramount importance; the Samothracian, which vied with these in attractiveness for the later Hellenic world, were not Hellenic in origin; nor wholly hellenized in character, and cannot be considered in an article of this compass.

As regards the Eleusinia, we are in a better position for the investigation of them than our predecessors were; for the modern methods of comparative religion and anthropology have at least taught us to ask the right questions and to apply relevant hypotheses; archaeology, the study of vases, excavations on the site, yielding an ever-increasing hoard of inscriptions, have taught us much concerning the external organization of the mysteries, and have shown us the beautiful figures of the deities as they appeared to the eye or to the mental vision of the initiated.

In seeking to guess what the secret of the mysteries was, we must first rid ourselves of the notion that it was any esoteric philosophy, or elaborate theology kept hidden from the world at large. Negatively, we have no jot of evidence that the initiates were more intelligent than the rest of Greece, or that their belief or practice differed from those of their fellow-countrymen to any marked degree, although there need be no doubt that a certain amount of verbal instruction was given by the hierophant (*see* below). Positively, we have the repeated insistence, from the Homeric hymn down (*hymn. Homer*, ii., 480) that the initiates saw something which greatly comforted their souls, not that they learned anything of great importance. What they saw was doubtless the sacred *dromenon*. We can realize what effect this might have on excited and believing minds, if we consider the importance, for a pious Catholic, of such impressive ceremonies as the elevation of the Host at mass.[1]

Our evidence is of two kinds. Firstly, a number of works of art show us scenes probably or certainly taken from the ritual of the Eleusinian or other mysteries. But here we may be certain that the artists, even if they themselves had no scruples, would not risk violating the deepest religious sentiments of thousands of their fellow-countrymen. Secondly, we have literary evidence. But this, if pagan, is restrained by the same reasons as the artists' from saying too much; if Christian, the writers seldom, if ever, can be shown to have been initiates themselves; some indeed cannot have been, for they were never pagans. Their

[1]This is well and sympathetically discussed by O. Kern, *Die griechischen Mysterien der klassischen Zeit* [1927], especially p. 23 ff. Aristotle [frag. 45, Rose] declares that the *mystae* learned nothing, but underwent "an experience and an influence" [*παθεῖν καὶ διατεθῆναι*;] an important testimony.

statements are generally uncritical and do not clearly differentiate between the Eleusinian mysteries and others, such as the Orphic, Sabazian, and those of Cybele and Attis.

The questions that the critical analysis of all the evidence may hope to solve are mainly these: (*a*) What do we know or what can we infer concerning the personality of the deities to whom the Eleusinian mysteries were originally consecrated, and were new figures admitted at a later period? (*b*) When was the mystery taken over by Athens and opened to all Hellas, and what was the state-organization provided? (*c*) What was the inner significance, essential content or purport of the Eleusinia, and what was the source of their great influence on Hellas? (*d*) Can we attribute any ethical value to them, and did they strongly impress the popular belief in immortality? Limits of space allow us only to adumbrate the results that research on the lines of these questions has hitherto yielded.

The paramount divine personalities of the mystery were, in the earliest period of which we have literary record, the mother and the daughter, Demeter and Kore, the latter being never styled Persephone in the official language of Eleusis; while the third figure, the god of the lower world known by the euphemistic names of Pluto (Plouton) and at one time Eubouleus, the ravisher and the husband, is an accessory personage, comparatively in the background. This is the conclusion naturally drawn from the Homeric hymn to Demeter, a composition of great ritualistic value, probably of the 7th century B.C., which describes the abduction of the daughter, the sorrow and search of the mother, her sitting by the sacred well, the drinking of the *κυκεών* or sacred cup, and the legend of the pomegranate. An ancient hymn of Pamphos, from which Pausanias freely quotes and which he regards as genuine[1], appears to have told much the same story in much the same way. As far as we can say, then, the mother and daughter were there in possession at the very beginning. The other pair of divinities known as ὁ θεός, ἡ θεά that appear in a 5th century inscription and on two dedicatory reliefs found at Eleusis, have been supposed to descend from an aboriginal period of Eleusinian religion when deities were nameless[2]. But for various reasons the contrary view is more probable, that ὁ θεός and ἡ θεά are later cult-titles of the married pair Pluto-Cora (Plouton-Kore), the personal names being omitted from that feeling of reverential shyness which was specially timid in regard to the sacred names of the deities of the underworld. And it is a fairly familiar phenomenon in Greek religion that two separate titles of the same divinity engender two distinct cults.

The question as to the part played by Dionysus in the Eleusinia is important. Some scholars, like M. Foucart, have supposed that he belonged from the beginning to the inner circle of the mystery; others that he forced his way in at a somewhat later period owing to the great influence of the Orphic sects who captured the stronghold of Attic religion and engrafted the Orphic-Sabazian *ἱερὸς λόγος*, the story of the incestuous union of Dionysus-Sabazius with Demeter-Kore, and of the death and rending of Zagreus, upon the primitive Eleusinian faith. A saner and more careful criticism rejects this view. There is no genuine trace discovered as yet in the inner circle of the mysteries of any characteristically Orphic doctrine; the names of Zagreus and Phanes are nowhere heard, the legend of Zagreus and the death of Dionysus are not known to have been mentioned there. Nor is there any print within or in the precincts of the *τελεστήριον*, the hall of the *Μύσται*, of the footsteps of the Phrygian deities, Cybele, Attis, Sabazius.

The exact relation of Dionysus to the mysteries involves the question as to the divine personage called Iacchus; who and what was Iacchus? Strabo (p. 468), who is a poor authority on such matters, describes him as "the daemon of Demeter, the founder of the leader of the mysteries." More important is it to note that "Iacchus" is unknown to the author of the Homeric hymn, and that the first literary notice of him occurs in the well-known passage of Herodotus (viii. 65), who describes the procession of the mystae as moving along the sacred way from Athens to Eleusis and as raising the cry Ἴακχε. We find Iacchus the theme of a glowing invocation in an Aristophanic Ode (*Frogs*, 324–398), and described as a beautiful "young god"; but he is first explicitly identified with Dionysus in the beautiful ode of Sophocles' *Antigone* (1119); and that this was in accord with the popular ritualistic lore is proved by the statement of the scholiast on Aristophanes (*Frogs*, 482) that the people at the Lenaea, the winter-festival of Dionysus, responded to the command of "Invoke the god!" with the invocation "Hail, Iacchus, son of Semele, thou giver of wealth!" We are sure, then, that in the high tide of the Attic religious history Iacchus was the youthful Dionysus, a name of the great god peculiar to Attic cult, and this is all that here concerns us to know.

We thus see that Iacchus was an Athenian, not an Eleusinian, god; his abiding-place was Athens, and he merely visited Eleusis for the mysteries. We may indeed conjecture that his votaries read Dionysiac interpretations into Eleusinian *dromena*. But all this is conjecture. The interpretation of what was shown would naturally change somewhat with the changing sentiment of the ages; but Demeter and Kore, *τὼ θεώ*, and no one else, are the paramount figures at Eleusis from the "Homeric" hymn to Alaric's invasion. Triptolemus the apostle of corn-culture, Eubouleus—originally a euphemistic name of the god of the under-world, "the giver of good counsel," conveying a hint of his oracular functions—these are accessory figures of Eleusinian cult and mythology that may have played some part in the great mystic drama that was enacted in the hall.

As to the history of the Eleusinian mysteries[1], the legends concerning the initiation of Heracles and the Dioscuri imply that originally they were closed to strangers, which, as they probably were in origin local rites in honour of local deities, is exactly what we should expect. But the "Homeric" hymn implies that they are open to all; with this we may connect the sagas of the conquest of Eleusis by Athens (*see* EUMOLPUS) and the early unification of Attica under Theseus (*see* CONSTITUTION OF ATHENS). By what steps the mysteries grew in importance and fame we do not know, but certainly Peisistratus paid attention to them, while Pericles found them highly important and made them more so. Decrees of his time[2] proclaim a holy truce for pilgrims to the festival and invite the subject-allies of Athens to send first-fruits of corn, a part of his imperial policy. The *μυστικὸς σηκός* at Eleusis is of his date.

At least from the 5th century onwards, Athens was in charge of the organization and external control of the mysteries, the management being in the hands of the archon basileus and a committee of four *epimeletai* (overseers) and a *paredros* (assessor). The State, as elsewhere in Greece, controlled the Church. But the priesthood was Eleusinian. Two ancient clans, the *Eumolpidai* (*see* EUMOLPUS) and the *Kerukes* (*see* HERALD) performed the whole ceremony between them; it appears that in the 4th century the *Kerukes* died out and the *Lukomidai* of Phlye took their place, perhaps bringing with them a tendency to Orphism. From the Eumolpidae was chosen the hierophant, who was so holy that his personal name was no longer used when once he was appointed, and he alone might enter the innermost shrine,—or perhaps, for the details are obscure, he and a priestess. Demeter and Kore had also each a *hierophantis* or female hierophant; considering that the Thesmophoria (*q.v.*) was entirely in the hands of women, it is not surprising that they took part in the mysteries also. The *Kerukes*, afterwards the *Lukomidai*, chose the δᾳδοῦχος or torch-bearer, who ranked next after the hierophant, from their number.

Turning now to the celebration itself, we can only sketch the more salient features here. On the 13th of Boedromion, the Attic month corresponding roughly to our September, the Ephebi (*q.v.*) marched out to Eleusis, and returned to Athens the next

day, bringing with them the "holy things" (ἱερά) to the "Eleusinion" in the city; these ἱερά probably included small images of the goddesses. The 16th was the day of the ἀγυρμός, the gathering of the catechumens, when they met to hear the address of the hierophant, called the πρόρρησις. This was no sermon, but a proclamation bidding those who were disqualified or for some reason unworthy of initiation to depart. The legally qualified were all Hellenes and subsequently all Romans above a certain—very youthful—limit of age, women, and as it appears even slaves; barbarians, and those uncleansed of some notorious guilt, such as homicide, were disqualified. We are sure that there was no dogmatic test, nor would time allow of any searching moral scrutiny, and only the Samothracian rites, in this respect unique in the world of classical religion, possessed a system of confessional. The hierophant appealed to the conscience of the multitude; but we are not altogether sure of the terms of his proclamation, which can only be approximately restored from late pagan and early Christian writers. We know that he demanded of each candidate that he should be "of intelligible speech (*i.e.*, Hellene) and pure of hand"; and he catechized him as to his condition of ritualistic purity— the food he had eaten or abstained from. It appears also from Libanius that in the later period at least he solemnly proclaimed that the catechumen should be "pure of soul" (*Or. Corinth,* iv. 356), and this spiritual conception of holiness had arisen already in the earlier periods of Greek religious thought. On the other hand we must bear in mind the criticism that Diogenes is said to have passed upon the Eleusinia, that many bad characters were admitted to communion, thereby securing a promise of higher happiness than an uninitiated Epameinondas could aspire to.

An essential preliminary was purification and lustration, and after the assembly the "mystae" went to the sea-shore (ἅλαδε μύσται) and purified themselves with sea-water, and probably with sprinkling of pigs' blood, a common cathartic medium. After their return from the sea, a sacrifice of some kind was offered as an essential condition of μύησις, but whether as a sacrament or gift-offering to the goddesses it is impossible to determine. On the 19th of Boedromion the great procession started along the sacred way bearing the "fair young god" Iacchus; and as they visited many shrines by the way the march must have continued long after sunset, so that the 20th is sometimes spoken of as the day of the exodus of Iacchus. On the way each wore a saffron band as an amulet; and the ceremonious reviling to which the μύσται were subjected as they crossed the bridge of the Cephissus answered the same purpose of averting the evil eye. Upon the arrival at Eleusis, on the same night or on the following, they celebrated a midnight revel under the stars with Iacchus, which Aristophanes glowingly describes.

The question of supreme interest now arises: What was the mystic ceremony in the hall; what was said and what was done? We can distinguish two grades in the celebration; the greater was the τέλεα and ἐποπτικά, the full and satisfying celebration, to which only those were admitted who had passed the lesser stage at least a year before. As regards the actual ritual in the hall of the mystae, much is still uncertain. That there was some kind of holy pageant or play, the accusations against Aeschylus and Alcibiades would suffice to prove, and Porphyry speaks of the hierophant and the δᾳδοῦχος acting divine parts. What the subject of this drama was may be gathered partly from the words of Clement—"Deo (Demeter) and Kore became the personages of a mystic drama, and Eleusis with its δᾳδοῦχος celebrates the wandering, the abduction and the sorrow" (*Protrept.*, p. 12, Potter), supported by Apuleius (*Met,* vi., 2). We may believe then that the great myth of the mother's sorrow, the loss and the partial recovery of her beloved was part of the Eleusinian passion-play. Did it also include a ἱερὸς γάμος? We should naturally expect that the sacred story acted in the mystic pageant would close with the scene of reconciliation, such as a holy marriage of the god and the goddess. But the evidence that this was so is mainly indirect, apart from a doubtful passage in Asterius, a writer of questionable authority in the 4th century A.D. (*Econom. martyr.* p. 194, Combe). At any rate, if a holy marriage formed part of the passion-play, it may well have been acted with solemnity and delicacy. We have no reason to believe that even to a modern taste any part of the ritual would appear coarse or obscene; even Clement, who brings a vague charge of obscenity against all mysteries in general, does not try to substantiate it in regard to the Eleusinia, and we hear from another Christian writer of the scrupulous purity of the hierophant.

It would be interesting to know if the birth of a holy child, a babe Iacchus, for example, was a motive of the mystic drama. The question seems at first sight to be decided by a definite statement of Hippolytus (*Philosoph.* 5, 8), that at a certain moment in the mysteries the hierophant cried aloud: "The lady-goddess Brimo has borne Brimos the holy child." But a careful consideration of the context almost destroys the value of his authority. For he does not pretend to be a first-hand witness, but admits that he is drawing from Gnostic sources, and he goes on at once to speak of Attis and his self-mutilation. The formula may then refer to the Sabazian-Phrygian mystery, which the Gnostics with their usual spirit of religious syncretism would have no scruple in identifying with the Eleusinian. And the archaeological evidence that has been supposed to support the statement of Hippolytus is deceptive.

The simple structure of the building and the absence of any reference, in the many inscriptions, to expenses for scenery or the like forbid us to suppose that there was any elaborate staging. The pageant-play produced its effect by means of gorgeous raiment, torches and stately figures.

But the mystic action included more than the pageant-play. The hierophant revealed certain holy objects to the eyes of the assembly. There is reason to suppose that these included certain primitive idols of the goddesses of immemorial sanctity; and, if we accept a statement of Hippolytus (*loc. cit.*) we must believe that the *epoptai* were also shown "that great and marvellous mystery of perfect revelation, a cut corn-stalk." The value of this definite assertion, which appears to be an explicit revelation of the secret, would be very great, if we could trust it; but unfortunately it occurs in the same suspicious context as the Brimo-Brimos formula, and we again suspect the same uncritical confusion of Eleusinian with Phrygian ritual, for we know that Attis himself was identified in his mysteries with the "reaped corn," the στάχυς ἀμητος, almost the very phrase used by Hippolytus. Only, it is in the highest degree probable, whether Hippolytus knew anything or not, that a corn-token was shown among the sacred things of a mystery which possessed an original agrarian significance and was intended partly to consecrate and to foster the agricultural life. But to say this is by no means the same as to admit the view of Lenormant[1] and Dr. Jevons[2] that the Eleusinians worshipped the actual corn, or revered it as a clan-totem. For of direct corn-worship or of totemism there is no trace either at Eleusis or elsewhere in Greece.

Among the δρώμενα or "things done" may we also include a solemn sacrament, the celebration of a holy communion, in which the votary was united to the divinity by partaking of some holy food or drink? We owe to Clement of Alexandria (*Protrept.* p. 18, Potter) an exact transcription of the pass-word of the Eleusinian mystae; it ran as follows (if we accept Lobeck's emendation of ἐγγευσάμενος for ἐργασάμενος) "I have fasted, I have drunk the barley-drink, I have taken (the things) from the sacred chest, having tasted therof I have placed them into the basket and again from the basket into the chest." We gather from this that some kind of sacrament was at least a preliminary condition of initiation; the mystae drank of the same cup as the goddess drank in her sorrow, partly—as we say—"in memory of her," partly to unite themselves more closely with her. We know also from an inscription that the priest of the Samothracian mysteries broke sacred bread and poured out drink for the mystae (*Arch. epigr. Mitth.*, 1882, p. 8, No. 14). But neither in these nor in the Eleusinian is there any trace of the more mystic sacramental conception, any indication that the votaries believed themselves to be partaking of the actual body of their

[1]Daremberg et Saglio, *Dictionnaire,* i., p. 1066.
[2]*Introduction to the Study of Religion.*

divinity[1], for there is no evidence that Demeter was identified with the corn, still less with the barley-meal of which the κυκεὼν was compounded. Nor is it likely that the sacrament was the pivot of the whole mystery or was part of the essential act of the μύησις itself. In the first place we have an almost certain representation of the Eleusinian sacrament on an archaic vase in Naples[2], probably of Attic *provenance*, and the artistic reproduction of a holy act would have been impious and dangerous, if this had belonged to the inner circle of the mystery. Again, there is no mention of sacrament or sacrifice among the five essential parts of μύησις given by Theo Smyrnaeus, nor in the imaginary narrative of the late rhetorician Sopatros (*Rhet. Graec.* viii, 121) who supposes the strange case of a man being initiated by the goddesses in a dream: they admit him to their full communion merely by telling him something and showing him something.

Besides the δρώμενα, then, there were also certain things said in the hall, or in the earlier stages of initiation, which we would gladly discover. Part of these were mystic formulae, one of which has been discussed already, the pass-word of the votaries. We gather also from Proclus and Hippolytus (*in Tim.* 293[c]; *Ref. Omn. Haer.* 5, 7, p. 146) that in the Eleusinian rites they gazed up to heaven and cried aloud "rain"—ὕε—and gazed down upon the earth and cried "conceive"—κύε. This ritual charm—we cannot call it prayer—descends from the old agrarian magic which underlay the primitive mystery. What else the votaries may have uttered, whether by way of thanksgiving or solemn litany, we do not know[3]. But there was also a certain ἱερὸς λόγος some exposition accompanying the unfolding of the mysteries; for it was part of the prestige of the hierophant that he was chief spokesman, "who poured forth winning utterance and whose voice the catechumen ardently desired to hear" (*Anth. Pal.*, app. 246); and Galen speaks of the rapt attention paid by the initiated "to the things done and said in the Eleusinian and Samothracian mysteries" (*De usu part.* 7. 14). But we have no trustworthy evidence as to the real content of the λόγος of the hierophant. We need not believe that the whole of his discourse was taken up with corn-symbolism, as Varro seems to imply (Aug. *de civit. Dei.* 20), or that he taught natural philosophy rather than theology, or again, the special doctrine of Euhemerus, as two passages in Cicero (*De natur. deor.* i. 42; *Tusc.* i. 13) might prompt us to suppose. His chief theme was probably an exposition of the meaning and value of the ἱερά as in an Australian initiation rite it is the privilege of the elders to explain the nature of the "churinga" to the youths. And his discourse on these may have been coloured to some extent by the theories current in the philosophic speculation of the day. But though in the time of Julian he appears to have been a philosopher of Neo-platonic tendencies, we ought not to suppose that the hierophant as a rule would be able or inclined to rise above the anthropomorphic religion of the times. Whatever symbolism attached to the ἱερά, the sacred objects shown, was probably simple and natural; for instance, in the Eleusinian, as in Egyptian eschatology, the token of the growing corn may have served as an emblem—though not a proof—of man's resurrection. The doctrine of the continuance of the soul after death was already accepted by the popular belief, and the hierophant had no need to preach it as a dogma; the votaries came to Eleusis to ensure themselves a happy immortality. And in our earliest record, the Homeric hymn, we find that the mysteries already hold out this higher promise. How, we may ask, were the votaries assured? The Egyptianizing theory of Foucart, that they were given directions and spells to take them past the terrors of the underworld, after the manner of the *Book of the Dead,* is wholly improbable. The terror of hell is not normal Greek, although something of the kind existed in Orphism; nor have we any evidence that spells of any kind were taught or that the λόγος was regarded as particularly important. If we could be sure that the Minoans had a developed eschatology (*see* Evans in *Journ. Hell. Stud.,* xlv. p. 43 ff., but *cf.* Nilsson, *Minoan-Myc. Rel.,* p. 549 ff.), we might suppose some of it to survive; but the matter is very doubtful.

The assurance of the hope of the Eleusinian votary was obtained by the feeling of friendship and mystic sympathy, established by mystic contact, with the mother and the daughter, the powers of life after death. Those who won their friendship by initiation in this life would by the simple logic of faith regard themselves as certain to win blessing at their hands in the next.

That the mysteries preached a higher morality than that of the current standard is not proved. That they exercised a direct and elevating influence on the individual character is nowhere explicitly maintained, as Diodorus (v. 49) maintains concerning the Samothracian. But on general grounds it is reasonable to believe that such powerful religious experience as they afforded would produce moral fruit in many minds. The genial Aristophanes (*Frogs,* 455) intimates as much, and Andocides (*De myster.* p. 36, § 31; p. 44, § 125) assumes that those who had been initiated would take a juster and sterner view of moral innocence and guilt.

Besides the greater mysteries at Eleusis, we hear of the lesser mysteries of Agrae on the banks of the Ilissus. Established, perhaps, originally by Athens herself at a time when Eleusis was independent and closed her rites to strangers, they became wholly subordinated to the greater, and were put under the same management and served merely as a necessary preliminary to the higher initiation into them. Sacrifice was offered to the same great goddesses at both; but we have the authority of Duris (*Athenae, 253d*), the Samian historian, and the evidence of an Attic painting, called the *pinax* of Nannion[1], that the predominant goddess in the mysteries at Agrae was Kore. And this agrees with the time of their celebration, in the middle of Anthesterion, when Kore was supposed to return in the young corn. Stephanus (*s.v.* Ἄγρα), drawing from an unknown source, declares that the Dionysiac story was the theme of their mystic drama; an isolated statement with nothing to confirm or interpret it.

The influence of Eleusis in early times must have been great, for we find offshoots of its cult, whether mystic or not, in other parts of Greece. In Boeotia, Laconia, Arcadia, Crete and Thera, Demeter was called Eleusinia, meaning in all probability "goddess of Eleusis." The initiation rites of Demeter at Celeae near Phlius, at Lerna in Argolis, and at Naples, were organized after the pattern of the Eleusinian. But of these and the other Demeter mysteries in the Greek world, there is little to record that is certain and at the same time of primary importance for the history of religion. The Arcadian city of Pheneus possessed a mystery that boasted an Eleusinian character and origin, yet in the record of it there is no mention of Kore, and we may suspect that, like other Demeter-worships in the Peloponnese, it belonged to a period when the goddess was revered as a single personality and Kore had not yet emanated from her. We know much more of the details of the great Andanian mysteries in Messenia, owing to the discovery of the important and much-discussed Andanian inscription of 91 B.C.[2]. But what we know are facts of secondary importance only. We gather from Pausanias (4. 33. 4; *cf.* 4. I. 5. and 4. 26. 8; 4. 27. 6) that the rites, which he regards as second in solemnity and prestige to the Eleusinian alone, were consecrated to the Μεγάλαι θεαί (the great goddesses) and that Kore enjoyed the mystic title of Hagnē, "the holy one." The inscription has been supposed to correct and to refute Pausanias, but it does not really controvert his statements, which are attested by other evidence; it proves only that other divinities came at

[1]This is Dr. Jevons's supposition—*op. cit.*—on which he bases an important theory of the whole Eleusinian mysteries and their intrinsic attraction.

[2](Farnell, *Cults,* vol. iii. pl. xv.[b]).

[3]The other formula which the scholiast on Plato (*Gorg.* 407 *c.*) assigns to the Eleusinian rite: "I have eaten from the timbrel, I have drunk from the cymbal, I have carried the sacred vessel, I have crept under the bridal-chamber," belongs, not to Eleusis, but, as Clement and Firmicus Maternus themselves attest, to Phrygia and to Attis.

[1]Farnell, *Cults of the Greek States,* vol. iii. p. 242, Pl. xvi.

[2]*See* Sauppe, *Mysterieninschrift von Andania; cf.* Foucart's commentary in Le Bas, *Voyage archéol.* 2, No. 326[a]; H. Collitz, *Dialect-inschriften,* 4689.

a later time to have a share in the mysteries, such as the Μεγάλοι θεοί who were probably the Cabeiri (*q.v.*). It is clear that the Andanian mysteries included a sacred drama, in which women personated the goddesses. The priestesses were married women, and were required to take an oath that they had lived "in relation to their husbands a just and holy life." We hear also of grades of initiation, purification-ceremonies, but of no sacrament or eschatologic promise; yet it is probable that these mysteries, like the Eleusinian, maintained and secured the hope of future happiness.

The Eleusinian faith is not wholly unattested by the grave-inscriptions of Hellas, though it speaks but rarely on these. The most interesting example is the epitaph of a hierophant who proclaims that he has found that "death was not an evil, but a blessing[1]."

Of equal importance for the private religion of Greece were the Orphic mystic societies, bearing a Thraco-Phrygian tradition into Greece, and associated originally with the name of Dionysus, and afterwards with Sabazius also and the later cult-ideas of Phrygia[2]. The full account of the Dionysiac mysteries would demand a critical study of the Dionysiac religion as a whole, as well as of the private sects that sprang up under its shadow. It is only possible here to indicate the salient characteristics of those which are of primary value for the history of religion.

Originally a great nature-god of the Thraco-Phrygian stock, powerful over all vegetation and especially revealing his power in the vine, Dionysus was forcing his way into Greece at least as early as the Homeric period, and by the 6th century was received into the public cults of most of the Greek communities. We can gather with some certainty or probability his aboriginal characteristics and the form of his worship. Being a god of the life of the earth, he was also a nether divinity, the lord of the world of souls, with whom the dead votary entered into privileged communion; his rites were mystic, and nightly celebrations were frequent, marked by wild ecstasy and orgiastic self-abandonment, in which the votary became at one with the divinity and temporarily possessed his powers; women played a prominent part in the ritual; a savage form of sacramental communion was in vogue, and the animal victim of whose flesh and blood the votaries partook was at times regarded as the incarnation of the divinity, so that the god himself might be supposed to die and to rise again; finally we may regard certain cathartic ideas as part of the primeval tradition of this religion. Admitted among the soberer cults of the Greek communities, it lost most of its wildness and savagery, while still retaining a more emotional ecstatic character than the rest. But this cooling process was arrested by a new wave of Dionysiac fervour that spread over Greece from the 7th century onwards, bringing with it the name of Orpheus, and engendering at some later date the Orphic brotherhoods (*thiasoi*). This religious movement may have started like the earlier one from the lands north of Greece; but Crete and even Egypt are supposed to have contributed much to the Orphic doctrine and ritual. Plato's contemptuous mention (*Rep.* 364A) of wandering Orphic initiators brings to our notice a phenomenon unknown elsewhere in Greek religion; the missionary spirit, the impulse to preach to all who would hear, which foreshadows the breaking down of the gentile religious barriers of the ancient world. And it is probable that some kind of "Orphic" propagandism, whether through books or itinerant mystery-priests, or both, had been in vogue some time before Plato. Orphism was known to Pindar (*Olym.* ii. and frags. 129-133 v. Christ) and Euripides, see *Hipp.* 952–4 and, yet more important, frag. 472 (*Nauck*) which attests the antiquity of these mystic Dionysiac associations in Crete. The initiated votary proclaims himself as sanctified to Zeus of Ida, to Zagreus and to the mountain-goddess Rhea-Cybele; he has fulfilled "the solemn rite of the banquet of raw flesh," and henceforth he "robes himself in pure white and avoids the taint of childbirth and funerals and abstains from meat." And—what is most significant—he calls himself by the very name of his god—he is himself Βάκχος. In spirit and in most of its details the passage accords well with the *Bacchae* of Euripides, which reflects not so much the public worship of Greece, but rather the mystic Dionysiac brotherhoods. Throughout this inspired drama the votary rejoices to be one with his divinity and to call himself by his name, and this mystic union is brought about partly, though Euripides may not have known it, through "the meal of raw flesh" or the drinking of the blood of the goat or the kid or the bull. The sacramental intention of this is confirmed by abundant proof; even in the state-cult of Tenedos they dressed up a bull-calf as Dionysus and reverentially sacrificed it (Ael. *Nat. an.* 12. 34); those who partook of the flesh were partaking of what was temporarily the body of their god. The Christian fathers at once express their abhorrence of this savage ὠμοφαγία and reveal its true significance (Arnob. *Adv. nat.* 5. 119); and Firmicus Maternus (*De error.*, p. 84) attests that the Cretans of his own day celebrated a funeral festival in honour of Dionysus in which they enacted the life and the death of the god in a passion-play and "rent a living bull with their teeth."

But the most speaking record of the aspirations and ideas of the Orphic mystic is preserved in the famous gold tablets found in tombs near Sybaris, one near Rome, and one in Crete. These have been frequently published and discussed; and here it is only possible to allude to the salient features that concern the general history of religion. They contain fragments of a sacred hymn that must have been in vogue at least as early as the 3rd century B.C., and which was inscribed in order to be buried with the defunct, as an amulet that might protect him from the dangers of his journey through the under-world and open to him the gates of Paradise. The verses have the power of an incantation. The initiated soul proclaims its divine descent: "I am the son of Earth and Heaven." "I am perishing with thirst, give me to drink of the waters of memory." "I come from the pure": "I have paid the penalty of unrighteousness": "I have flown out of the weary, sorrowful circle of life." His reward is assured him: "O blessed and happy one, thou hast put off thy mortality and shalt become divine." The strange formula ἔριφος ἐς γάλ' ἔπετον "I a kid fell into the milk," has been interpreted by Dieterich (*Eine Mithras-Liturgie*, p. 174) with great probability as alluding to a conception of Dionysus himself as ἔριφος, the divine kid, and to a ritual of milk-baptism in which the initiated was born again[1].

We discern, then, in these mystic brotherhoods, the germs of a high religion and the prevalence of conceptions that have played a great part in the religious history of Europe. And as late as the days of Plutarch they retained their power of consoling the afflicted (*Consol. ad. uxor.*, *c.* 10).

The Oriental mysteries, associated with Attis, Cybele, Isis and Sabazius, which invaded later Greece and early imperial Rome, were originally akin to these and contained many concepts in common with them. But their orgiastic ecstasy was more violent, and the psychical aberrations to which the votaries were prone through their passionate desire for divine communion were more dangerous. Emasculation was practised by the devotees of Attis, whatever the reason may have been[2], and the high priest himself bore the god's name. Or communion with the deity might be attained by the priest through the bath of blood in the taurobolium (*q.v.*), or by the gashing of the arm over the altar. A more questionable method which lent itself to obvious abuses, or at least to the imputation of indecency, was the simulation of a sacred marriage, in which the catechumen was corporeally united with the great goddess in her bridal chamber (Dieterich, *op. cit.* pp. 121–134). Prominent also in these Phrygian mysteries were the conception of rebirth and the belief, vividly impressed by solemn pageant and religious drama, in the death and resurrec-

tion of the beloved Attis. The Hilaria in which these were represented fell about the time of our Easter; and Firmicus Maternus reluctantly confesses its resemblance to the Christian celebration (Farnell, *Cults*, iii, 299).

The Eleusinian mysteries are far more characteristic of the older Hellenic mind. These later rites breathe an oriental spirit, and though their forms appear strange and distorted they have more in common with the subsequent religious phenomena of Christendom. And the Orphic doctrine may have even contributed something to the later European ideals of private and personal morality.*

MYSTERY STORIES. Although the "mystery story" as a minor literary genre, a convenient category for book reviewers, is not old, its origins are lost in the blackout of antiquity. Its seeds are found in the folklore of the oldest nations: little tales, hints, anecdotes, superstitions, that are as old as recorded time. They are part of ethnology, philosophy, religion; and their long growth into a department of literary art or artifice parallels the history of man's mind.

In that history the emotion of fear always has bulked large, and the oldest and strongest of man's fears is fear of the unknown. Mystery, by definition, is that which is unknown. But tied in with fear of the unknown is the emotion of curiosity concerning it; and out of that fear and curiosity perhaps was born the mystery story, at first a tale of wonder and terror concerned largely with supernatural matters. Later it became a subsidiary of romance; and in still later times, notably our own, it came to be a sort of game invented and played for intellectual relaxation and artificial excitement.

"The art of self-tormenting is an ancient one, with long and honorable literary traditions," in the words of Dorothy L. Sayers[1]; and, commenting on the present scene, she adds: "Man, not satisfied with the mental confusion and unhappiness to be derived from contemplating the cruelties of life and the riddle of the universe, delights to occupy his leisure moments with puzzles and bugaboos." More pungently, Carolyn Wells[2] has observed that "in safe surroundings people like to be frightened."

Early examples of the mystery story are to be found in the folklore of all times and races, notably in that of Egypt, China, India and the Semitic nations. Cosmic terror appears as an ingredient of this mythology in all literatures; it is probable that great tracts of it vanished in prehistoric times for lack of a written medium. Certain supernatural themes appear, with little variation, in the traditions of all nations, pointing to yet earlier stories unknown to historians. The earliest known specimens are concerned with witchcraft, fairies, vampires, werewolves, ghosts (friendly and unfriendly), wraiths of the living and similar occult phenomena, much of it still in use by contemporary practitioners.

It will not do to identify the mystery story too completely with the horror story or the tale of terror; but in its origins it was probably no more than that—before the creative impulse added riddles and puzzles ingeniously devised for their own sake. Today a mystery story is, loosely, any story containing a mystery. It may be, and frequently is, a tale of horror and terror; but it may also be a pseudoscientific fantasy, a tale of diplomatic intrigue, an affair of codes and ciphers and secret societies, a crime story or a dozen other things involving an enigma. In the beginning, however, it was a tale of spectres and the supernatural.

It will be noted that the detective story *per se* is omitted from the above list. By recent arbitrary definition, the detective story, lustiest offspring of the mystery story, is a separate and distinct division of literature, a "pure" form that demands individual consideration. However, it is obviously a mystery story; the separation is largely one of convenience.

While mystery stories cannot always be classified with exactness—since mystery is everywhere present—they may be divided, for easy understanding, into three groups: ghost stories, riddle stories and detective stories. The literature of ghosts, as already stated, is time old. The middle ages took over the dark heritage of antiquity and amplified it with academically formulated magic and cabbalism. In Germany and England particularly, the tale took on a terrible intensity and a macabre atmosphere, with its Witches' Sabbaths, Daemon Lovers, and similar paraphernalia that doubled the force of its horrors. Perhaps the ghostly angle—complicated by devils, ghouls, ruined castles, subterranean passages, and suchlike mediaeval claptrap—began to emerge most clearly as a department of romance in the 18th century, with what is called the Gothic tale.

It was invented by a worldly Englishman, Horace Walpole, whose *Castle of Otranto* (1764) may be said to have founded the horror story as a permanent form. Among his outstanding successors were Anne Radcliffe (*The Mysteries of Udolpho*, 1794), Matthew Gregory Lewis (*The Monk*, 1795), Charles Robert Maturin (*Melmoth the Wanderer*, 1820) and the early American novelist, Charles Brockden Brown. Mary Godwin Shelley, the wife of the poet, took a hand in the game, in 1817, with her famous novel *Frankenstein*, still a classic horror story, and with it introduced the pseudoscientific note—the creation out of charnel fragments of a monster that ultimately destroyed its creator.

The influence of the Gothic tale persisted well into the 19th century in the work of such writers as J. Sheridan Le Fanu and Wilkie Collins; indeed, it is obvious in Bram Stoker's gruesome vampire tale *Dracula*, published as late as the year 1891. And pseudoscientific nightmares have not ended with H. G. Wells. Greatest of all names in the field, however, is that of Edgar Allan Poe (1809–1849), who first forced the tale of mystery and horror into the artistic regions of pure literature, and invented the modern short story form. He is the classic of the genre, and his influence has been enormous in nearly all lands. His masterly stories of bizarre incident, his tales of ratiocination, his psychological studies, tales of conscience and romances of death, have made him a major prophet of literature. His most relevant successors perhaps have been Le Fanu, a strangely neglected Irish genius, Robert Louis Stevenson, Arthur Conan Doyle, Ambrose Bierce, Arthur Machen, Algernon Blackwood, Lord Dunsany and the American *fantaisiste*, H. P. Lovecraft. But any such list of masters is inevitably and unfairly incomplete—such isolated masterpieces as W. W. Jacobs' "The Monkey's Paw," have not infrequently lifted writers of a more miscellaneous genius into the front rank of mystery masters.

Riddle stories too began in time out of mind, for the enjoyment of puzzles—Miss Sayers' "art of self-tormenting"—is as old as humanity itself. But there is a practical utility in puzzle-solving, also, that no doubt was recognized by the ancients; regular exercise is as necessary for the brain as for the body. The riddle of Samson, propounded in the Bible (*Judges*, 14: 12–18), is the most famous early example; but, although Samson has been called the Father of Riddles, it may be that older and better ones were even then buried in antiquity. "Out of the eater," *etc.*, propounded about 1200 B.C., at least contains the true principle of the riddle and the riddle story: the asker already knew the solution, and that was the reason the guessers strove to attain a re-solution. In those days riddles were commonly proposed at wedding feasts and other social events, and obviously they were very popular.

Among the Egyptians puzzling was a religious rite and the Sphinx was their goddess. We are told that such was the esoteric religion of the Egyptians that all the priests were riddlers and their religion one vast enigma. The classic "riddle of the Sphinx," however, belongs to Grecian mythology. Its date is not authenticated but it wears the halo of antiquity, for Sophocles wrote about it in the 4th century B.C.

So much for antiquity: the riddle story came down the years as did the ghost story, and not infrequently the two overlapped. Its distinguishing feature, at the moment, is that the reader shall be confronted with a number of mysterious facts and situations, explanation of which is reserved until the end of the story. Unlike the pure detective story—which also, of course, is a riddle story—there may be no clues, either leading or misleading, to assist or to trick the reader. The whole operation of reading may be one of sustained wonder and abiding curiosity. Equally, however, there may be numerous clues to solution: the tale will not turn into a detective story unless there is crime and detection—*i.e.*, crime *plus* detection.

A good example of the riddle story may be one describing a search for lost treasure, in which mysterious conditions are encountered. In many such, a cipher or cryptogram is added to the business of the tale, to complicate the over-all mystery with an interior riddle that most readers find irresistibly attractive. Poe's great short story, "The Gold Bug," is a classic example of this ingenious and popular story-plot. Of another kind is Kipling's short mystery, "The Sending of Dana Da," a tale involving a plethora of cats visited upon a hater of cats. In the more sinister field of murder are innumerable tales of roguery involving mystery and crime, but without the familiar detective interludes. Two notable—almost notorious—riddle stories of modern times offered no solution to the riddle posed and gained wide attention by their novelty—"The Lady or the Tiger" by Frank R. Stockton, and "The Mysterious Card" by Cleveland Moffett.

More nearly kin to the detective story than any of these are the spy stories, the secret service stories, the tales of international intrigue and adventure that, in our own day, have been entertainingly

*See *Archiv für Religionswiss.* (1906), article by Salomon Reinach.

written and prolifically produced by such men as E. Phillips Oppenheim, John Buchan, "Francis Beeding," Valentine Williams, H. C. McNeile and William Le Queux, to name only half a dozen out of many who are typical. These stories are on the borderline between adventure and bona fide detection; in certain instances—*Bulldog Drummond, Clubfoot, et al.*—they overlap the pure detective story and almost force an entrance into the more select field. But they have been relegated to the broader acres of general mystery by detective story students and specialists who prefer their detection straight.

Detective Stories.—The detective story, as a literary form, celebrated its 100th anniversary in April 1941. Pedantry asserts that its seeds are to be found in the earliest folklores, and it is true that the antecedents of the various motifs combined in the genre are as old as man's mental habits, of which they are in part the history. The puzzle motif is as old as the Prophets, and the Erinyes theme—revenge relentlessly tracking down the wicked—is anterior to literature. Alleged examples of the "detective story," in this prenatal sense, have been dug from the pages of Aesop, Herodotus, Cicero, Vergil and the authors of the Apocryphal Scriptures: specimens have been found in all the literatures of the East. Best of these, perhaps, is the Apocryphal account of Daniel's superb sleuthing in the story of "Bel and the Dragon," in which the prophet is shown to have anticipated Sherlock Holmes by many centuries.

Mediaeval literature also yields relevant tales and legends from the writings of Boccaccio, Chaucer and others, revealing detectival habits of thinking in certain fictive characters; and more pertinent examples are outstanding in the *Arabian Nights.* Most striking of modern prototypes is a famous chapter in Voltaire's *Zadig,* an 18th century romance in which the philosopher-hero accurately describes a lost horse and dog, although he has seen neither, by pure Holmesian deduction.

Nevertheless, the detective story as we know it was born in the pages of *Graham's Magazine,* a Philadelphia journal, in April 1841, with the publication of a short story, "The Murders in the Rue Morgue," by Edgar Allan Poe. Of this story, Dorothy L. Sayers[3] has observed that "it constitutes in itself almost a complete manual of detective theory and practice." A sequel, "The Mystery of Marie Rogêt," appeared in *Snowden's Ladies' Companion,* of New York, in the issues of November and December 1842, and February 1843. Poe's third and last pure detective story, "The Purloined Letter," was published in a Philadelphia annual, *The Gift,* for the year 1845, in which year all three stories, with others, were brought together in a book called simply, *Tales,* the most important volume in the history of the detective story. Each of the three tales celebrated an exploit of the Chevalier C. Auguste Dupin, who must be called the first fictional detective, and this for a good reason: the profession of detective had only recently been invented, and until there were detectives in the world to write about, no stories about them were possible.

If anybody preceded the American, it was Eugène François Vidocq, the reformed French thief, who established the world's first official detective bureau, at Paris in 1817, and published his *Mémoires* in 1828–29. There is no doubt that Poe read this book and was influenced by it; but presumably—and ostensibly—Vidocq's volume was a factual record of his own experience, not a fictional detective story. And if Poe drew somewhat of his inspiration from the French book—the background of his tales was the Paris of Vidocq's *Brigade de Sureté*—Dupin was no Vidocq: he was Poe, himself, in a new rôle invented for the occasion, that of the perfect reasoner, the divine amateur, later to find world popularity in the epic figure of Sherlock Holmes. It may be noted, however, that Poe did not use the word *detective* in any of his stories: that was to come later.

With Poe's three tales of ratiocination, almost miraculously the detective story sprang into flower full blown. "The extraordinary thing," says H. Douglas Thomson, in *Masters of Mystery,* "is that at its very inception the principles and canons of detective fiction writing were brilliantly conceived, even with a touch of finality." It is not known why Poe stopped at the third story: he may have tired of his creation or, as is more likely, the public response may have been lukewarm. Two other mysteries by this author, "The Gold Bug" and "Thou Art the Man," are sometimes called detective stories, but strictly speaking they are outside the canon.

Poe was ahead of his public. Twenty years were to elapse before the infant he had laboured and then deserted was adopted; and then it was by a parent from another land. The year was 1866 when Emile Gaboriau, who had been contributing stories of military and fashionable life to the Parisian newspapers, began to publish his *L'Affaire Lerouge* in *Le Pays,* and woke up one morning to find himself famous. Thereafter until his death in 1873 he was a busy man, for he had invented the *long* detective story and it was a spectacular success. Other detective novels flowed from his pen—*Le Dossier 113, Le Crime d'Orcival, Monsieur Lecoq*—and his detective creations, Père Tabaret and Lecoq, now stand with Dupin on the shelf of illustrious practitioners. Less clever than Dupin, they were more humorously alive—more recognizably human, indeed: Tabaret, the bibliomaniac amateur, Lecoq, the brilliant professional. With Dupin they are the forerunners, the immediate ancestry, of Sherlock Holmes. It is possible that Gaboriau was familiar with Poe's *Tales,* in the translation of Baudelaire (1856–57), but more likely that he was directly influenced by Vidocq, whose *Mémoires* were looted by scores of French writers of the period, among them Balzac, Hugo and Dumas. These masters, however, never wrote a detective story. Gaboriau's only relevant contemporary was his successor and imitator, Fortuné du Boisgobey, author of a line of sensational police romances, of which the first, *Le Forçat Colonel,* was published in 1872.

But before Gaboriau had ceased to write, the movement had crossed the Channel; the next landmark in detective fiction was English. In 1868, within a year of the appearance of *L'Affaire Lerouge,* a famous book was published in London—*The Moonstone,* by Wilkie Collins. An earlier masterpiece by Collins, *The Woman in White,* had appeared in 1860, but, although an excellent mystery, it was not a detective story. In *The Moonstone,* Collins wrote what many critics have called the greatest detective story of them all. However that may be—and the detection in the book is not exhibitional, but a device to catalyze the elaborate ingredients—it was the first full-length detective novel in English, and is properly a classic. With Sergeant Cuff, the professional detective who raised roses in his unprofessional moments, says Mr. Thomson,[4] "the paradox was born, the detective with a sensibility greater than his sense." With Sergeant Cuff also, it has been said, "character began to raise its head."

Throughout all these years, Charles Dickens had been writing voluminously in England, without producing a detective novel. He was, however, interested in police work and had watched the growth of England's protective system with alert appreciation of its possibilities for literature. In 1829, Sir Robert Peel had established the London metropolitan police force, with a back door opening on a spot called Scotland Yard; and in 1842 a detective branch had been added, with headquarters in the Yard itself. Thus the scene was set; and it may be said that Dickens in a sense inaugurated the long literature that followed those momentous events when, in 1853, he made his friend Inspector Field a character in *Bleak House.* However, *Bleak House* is not a detective novel. Suddenly, in the last year of his life, and probably under the influence of Collins, he began to write *The Mystery of Edwin Drood* but died with the novel half finished on his desk. The fragment was published in 1870 and remains to this day the most exasperating detective story in the world. Hundreds of literary detectives have tried to penetrate its mystery and none has succeeded. There can be little doubt, though, that the book is another landmark in this history.

In America, meanwhile, a young woman named Anna Katharine Green was getting ready to write *The Leavenworth Case,* first of a long line of melodramatic novels of crime and detection from the same hand. The book appeared in 1878 and is still its author's most famous story, although possibly not her best. It is an American classic, however, the first detective *novel* by an American and the first by a woman in any language. Stilted and old-fashioned as Miss Green's books now seem, her plots, says Howard Haycraft, in *Murder for Pleasure,* are "models of careful construction that can still hold their own against today's competition."

Two remarkable events occurred in 1887 to make that year memorable in the history of the detective story. Out of Australia came a sensational thriller, *The Mystery of a Hansom Cab,* by Fergus Hume, to become the greatest commercial success in the annals of literary crime. Issued in paper wrappers at a small figure, it is said that its first London edition of 25,000 copies was exhausted in three days. When Hume died, in 1932, more than half a million copies had gone over the counter, and all without profit to the author, who had sold the book outright for £50. This famous tale is scarcely readable today, but historically it is important; and with it survives the name of its author. Although Hume wrote more than a hundred other books after his first great triumph, he was never able to repeat his success.

That was the first event. The second was the appearance of Sherlock Holmes, still the greatest name in detective literature. His creator, Arthur Conan Doyle, was a young Scotch-Irish physician, who had been inspired by an insufficiency of patients to try his hand at writing: *A Study in Scarlet,* first of the Holmes stories, was a potboiler that brought him only £25. It appeared just before Christmas, 1887, and there was no sequel until 1890, when *The Sign of Four* was written for an American magazine. Neither story set England on fire, but both were widely pirated in America, in the absence of an international copyright act. The widespread popularity of the detective dates from July 1891, when "A Scandal in Bohemia," first of the shorter *Adventures of Sherlock Holmes,* was published in the *Strand Magazine,* to be followed by 23 others over the next two years. The last 12 became the *Memoirs of Sherlock Holmes,* and in the final story Holmes was killed off by his creator, a deed of violence that shocked the world. By that time, however, the doctor's future had been assured; he had given up medicine, and was—as he confessed—heartily tired of his famous puppet, who was obscuring his more important work in the historical field.

But public indignation harassed him until he was forced to bring Holmes back to life. In 1902 he yielded to supplication and published *The Hound of the Baskervilles,* a "reminiscence" of Sherlock Holmes; in 1905 he surrendered unconditionally, in *The Return of Sherlock Holmes,* in which he resurrected the detective with great ingenuity.

Three other volumes followed, *The Valley of Fear* in 1915, *His Last Bow* in 1917, and *The Case-Book of Sherlock Holmes* in 1927. Sir Arthur Conan Doyle died in 1930, leaving behind him the greatest reputation in the history of detective fiction, and a detective whose name bids fair to remain a permanent part of the English language.

For the inspiration that led Conan Doyle to write the tales of Sherlock Holmes we have to thank, first, his unemployment; second, his admiration for the work of Poe and Gaboriau; and last, his happy recollection of the methods and mannerisms of his old teacher, Dr. Joseph Bell of Edinburgh, who was the living prototype of the detective. Most of the stories are told by the amiable and obtuse Doctor Watson, a fictional character almost as famous and well-loved as Holmes himself. In Watson, it is fair to assume, we have a self-portrait of Dr. Conan Doyle, the impecunious Portsmouth physician who contributed them both to the gallery of immortals.

Thus, says Dorothy L. Sayers,[3] "the ball—the original nucleus deposited by Edgar Allan Poe nearly 40 years earlier—was at last set rolling. As it went, it swelled into a vast mass—it set off others—it became a spate—a torrent—an avalanche of mystery fiction." In England and America writers were quick to try their talents at the popular game, and for the most part the Sherlock model prevailed. Best of immediate imitations was *Martin Hewitt, Investigator* (1894), by Arthur Morrison, and its several sequels. Simultaneously, pseudo-scientific detection made its appearance in the tales of Mrs. L. T. Meade and her collaborators, Clifford Halifax and Robert Eustace, a series that began with *Stories from the Diary of a Doctor,* in 1894. The aestheticism of the 1890s was reflected in the genre, to some extent, in M. P. Shiel's *Prince Zaleski* (1895); and Grant Allen closed the decade with three excellent volumes, of which the best was *Hilda Wade,* published in 1900.

The 20th century opened with the Baroness Orczy's anonymous detective, *The Old Man in the Corner,* functioning brilliantly in the magazines (book publication was delayed), and between the years 1907 and 1911 three detectives of the first water appeared in covers: Dr. John Thorndyke, in R. Austin Freeman's *The Red Thumb Mark* (1907), A. E. W. Mason's Hanaud, in *At the Villa Rose* (1910) and G. K. Chesterton's Father Brown, in *The Innocence of Father Brown* (1911). Father Brown, the little English Catholic priest, has been called one of the immortals, and Thorndyke is indubitably great, a scientific investigator whose science is as sound as it is fascinating. In 1913 *Trent's Last Case,* by E. C. Bentley, was hailed by critics as one of the great masterpieces of the genre. The Sherlock Holmes period may be said to have ended, in England, with Ernest Bramah's *Max Carrados* (1914), a volume of notable short stories introducing the first *blind* detective.

The American scene, in the early years of the century, produced detective stories in number, but only a few that were important. Still remembered is the work of Jacques Futrelle, best viewed in *The Thinking Machine* (1907), and Arthur B. Reeve, whose stories in *The Silent Bullet* (1912) introduced the long series about Craig Kennedy. More important are Mary Roberts Rinehart and, perhaps, Carolyn Wells. Mrs. Rinehart's *The Circular Staircase* (1908) was the first of several books—on the borderline between detection and mystery—that helped to make her for a time the most popular of American storytellers. Miss Wells, with less talent, wrote more than 70 detective novels, most of them starring her Sherlockian creation, Fleming Stone. "High spots" of the period were *In the Fog* (1901) by Richard Harding Davis, Cleveland Moffett's *Through the Wall* (1909), *The Mystery of the Boule Cabinet* (1912) by Burton E. Stevenson and *The Achievements of Luther Trant* (1910) by William MacHarg and Edwin Balmer. In the latter book the methods of the psychological laboratory were used for the first time in fictional crime detection.

America's outstanding contribution to detective fiction, after Poe's Dupin stories, was *Uncle Abner, Master of Mysteries,* by Melville Davisson Post, which was not published until 1918; but as early as 1896 Post had begun his career in crime literature. His first attempts were stories of legal chicanery, but by 1909 his tricksy lawyers had gone over to the side of law and order and this superlative technician was moving into the field of pure detection. In the Uncle Abner stories, tales of early Virginia, he produced an American classic and added the first great American investigator to the gallery of illustrious detectives. Post's only comparable contemporary was Frederick Irving Anderson, who published just three books between 1914 and 1930, and was in consequence forgotten between volumes: his best-known work is *The Book of Murder* (1930).

Of the years between the first and second world conflicts it is difficult to write briefly. For a time, the most popular writer of detective fiction in the world probably was J. S. Fletcher, whose excellent novels were given a tremendous impetus by President Wilson's publicized pleasure in *The Middle Temple Murder* (1918). Then, in 1920, another great landmark made its appearance in England: this was *The Cask,* by Freeman Wills Crofts, a book of remarkable quality that has influenced profoundly the modern detective story as a whole. "Mr. Crofts," says John Carter,[5] "combined the elaboration of Gaboriau with an integrity of method which set an altogether new standard for the many police detectives who have followed [his] Inspector French." And the years from 1920 onward introduce, one after another, names that today are household words among readers of detective fiction: Poirot, in Agatha Christie's *Mysterious Affair at Styles* (1920); Reggie Fortune, in H. C. Bailey's *Call Mr. Fortune* (1920); Lord Peter Wimsey, in Dorothy L. Sayers' *Whose Body?* (1923); Anthony Gethryn, in Philip MacDonald's *The Rasp* (1924); Dr. Priestley, in "John Rhode's" *Paddington Mystery* (1925); Roger Sheringham, in Anthony Berkeley's *Layton Court Mystery* (1925); J. G. Reeder, in Edgar Wallace's *The Mind of Mr. J. G. Reeder* (1926).

Others who contributed notable volumes of detection in this period were Eden Phillpotts and A. A. Milne, authors more widely known in other fields. In *Enter Sir John* (1928), Clemence Dane and Helen Simpson created a popular actor-detective. Albert Campion, languid hero of a dozen distinguished books by Margery Allingham, although he made his first appearance in 1928, did not reach his peak until 1934. All in all, the third decade of the century was memorable—a golden age of the detective story.

In America also, in this decade, important deeds were accomplished: at least four fictional detectives of stature were added to the records. Chronologically, Charlie Chan was first: a new and appealing figure in the world of fantasy, he made his bow in *The House Without a Key* (1925), by Earl Derr Biggers. Five other novels now celebrate his exploits and, aided by the motion pictures, the aphoristic little Chinese-American lives in the affection of readers more surely than many better detectives.

Philo Vance, his immediate successor, is still the best American detective in the English tradition. With Vance, according to Howard Haycraft,[6] "overnight, American crime fiction came of age." Introduced in *The Benson Murder Case* (1926), by S. S. Van Dine, his later appearances broke records for detective fiction and made him for some years the most famous fictional sleuth in the world. Van Dine, his reputed creator, was in reality Willard Huntington Wright, a well-known critic of the arts—and, like his hero, a dilettante—who brought all his imposing erudition in several fields to the task of making Vance one of the immortals of detective fiction. In spite of considerable pretentiousness, and some lack of humour, it may be admitted that he succeeded.

Ellery Queen, as writer and detective, entered the field in 1929: the name is a pseudonym concealing the identities of Frederic Dannay and Manfred B. Lee; but Queen also is the central figure in the stories written under that name. Since his appearance in *The Roman Hat Mystery,* his adventures have been increasingly popular: his name is the trademark of a reliable brand of entertainment.

Last and most important of the four leading American writers of the period is Dashiell Hammett, ex-Pinkertonian and graduate of the pulp magazines, whose unsentimental narratives have established new standards of realism in the detective story field. In five novels of startling originality, backgrounded largely by the underworld of American gangsterdom, Hammett invented what has been called the hard-boiled school of crime fiction; but he did more than that—he created a definitely American *style,* separate and distinct from the English pattern which had been slavishly followed by American writers for generations. As character studies alone, it is claimed, his stories approximate capitalized Literature. His influence, however, while enormous, has not been altogether good: it has been the more meretricious of Hammett's spectacular bag of tricks that have been exploited by his less talented imitators, in particular his not infrequent salaciousness. First of the Hammett novels was *Red Harvest* (1929). His masterpiece is generally believed to be *The Maltese Falcon* (1930), one of the all-time high points in its field. His most sensationally successful story, *The Thin Man* (1932), was the last of an extraordinary quintette. As summing up his short and brilliant career critical opinion today finds that no other writer of modern times has so basically changed and influenced the detective story form.

Most popular of American writers since Hammett have been Erle Stanley Gardner, author of the persistent Perry Mason novels; Rex Stout, whose fat, orchid-raising Nero Wolfe seems to have become a permanent part of the new mythology; and Raymond Chandler, Hammett's most relevant successor. In England, the best traditions of Holmes, Thorndyke, *et al.,* have been carried on in the literate entertainments of such writers as Nicholas Blake, Michael Innes, Ngaio Marsh and Cyril Hare. A top-flight practitioner hailed on both sides of the Atlantic is the Anglo-American writer John Dickson Carr ("Carter Dickson").

On the continent of Europe, except in France, few detective stories of distinction were published at any time. Germany's efforts along the years have been abortive and ponderous; and examples of Scandinavian detective literature, although readable, are unexceptional and not strictly canonical. In France, two writers of high importance must be noted in Gaston Leroux and Maurice Leblanc. Leroux's *Le Mystère de la Chambre Jaune* (1908) has been called the masterpiece of French detective fiction. In Arsène Lupin, in the same period, Leblanc created a romantic rogue, half detective, who ranks with E. W. Hornung's Raffles in popular esteem. It was not until 1930 that a writer came to stand with Gaboriau, Leroux and Leblanc: then there appeared a figure of international interest, Georges Simenon. His masterful and masterly Inspector Maigret is now popular in 17 languages and recently has taken England and America by storm. Introduced to the English-speaking world in *The Patience of Maigret* (1940), he is the newest of the "immortals"; in the opinion of a critic, "the greatest character in detective fiction since Sherlock Holmes."

Thus the detective story's climb to the world popularity it now

enjoys is seen to have been slow until recent times. Figures indicate that from its beginnings with Poe, in 1841, up to and including the year 1920, approximately only 1300 new titles were published in English-speaking countries; whereas, from 1921 to the end of 1940 more than 8,000 new titles were published. In this summary, "dime novel" figures are included; *i.e.,* the statistics of such series as the Nick Carter and Sexton Blake libraries. The greater activity began in 1929, in which year, and the next, as many books were published as in the preceding 8 years. The most extraordinary gain was in the years 1931–40 inclusive, when some 6,000 titles were published. The peak year was 1938, a year that produced 2 volumes a day throughout its course. In the years 1931–40 about 1,100 new writers of detective stories appeared, as against an approximate 600 in the previous decade, and as against about 300 in all the preceding 80 years.

MYSTICISM, a phase of thought, or rather perhaps of feeling, which from its very nature is hardly susceptible of exact definition. It appears in connection with the endeavour of the human mind to grasp the divine essence or the ultimate reality of things, and to enjoy the blessedness of actual communion with the Highest. The first is the philosophic side of mysticism; the second, its religious side. The first effort is theoretical or speculative; the second, practical. The thought that is most intensely present with the mystic is that of a supreme, all-pervading, and indwelling power, in whom all things are one. Hence the speculative utterances of mysticism are always more or less pantheistic in character. On the practical side, mysticism maintains the possibility of direct intercourse with this Being of beings—intercourse, not through any external media such as an historical revelation, oracles, answers to prayer, and the like, but by a species of transfusion or identification, in which the individual becomes in very truth "partaker of the divine nature." God ceases to be an object to him, and becomes an experience.

Universality.—In the writings of the mystics, ingenuity exhausts itself in the invention of phrases to express the closeness of this union. Mysticism differs, therefore, from ordinary pantheism in that its inmost motive is religious; but, whereas religion is ordinarily occupied by a practical problem and develops its theory in an ethical reference, mysticism displays a predominatingly speculative bent, starting from the divine nature rather than from man and his surroundings, taking the symbolism of religious feeling as literally or metaphysically true, and straining after the present realization of an ineffable union. The union which sound religious teaching represents as realized in the submission of the will and the ethical harmony of the whole life is then reduced to a passive experience, to something which comes and goes in time, and which may be of only momentary duration. Mysticism, it will be seen, is not a name applicable to any particular system. It may be the outgrowth of many differing modes of thought and feeling. Most frequently it appears historically, in relation to some definite system of belief, as a reaction of the spirit against the letter. When a religion begins to ossify into a system of formulas and observances, those who protest in the name of heart-religion are not unfrequently known by the name of mystics. At times they merely bring into prominence again the ever-fresh fact of personal religious experience; at other times mysticism develops itself as a powerful solvent of definite dogmas. Mysticism appears in various phases in all the higher religions known to history. Its distinctive characteristics emerge in the religions of India and Persia as well as in the faith of Islam. These subjects are dealt with elsewhere; but its relation to Judaism and the religions of Greece requires special mention here. For opposite reasons, neither the Greek nor the Jewish mind lent itself readily to mysticism: the Greek, because of its clear and sunny naturalism; the Jewish, because of its rigid monotheism and its turn towards worldly realism and statutory observance. It is only with the exhaustion of Greek and Jewish civilization that mysticism becomes a prominent factor in Western thought. It appears, therefore, contemporaneously with Christianity, and is a sign of the world-weariness and deep religious need that mark the decay of the old world. Whereas Plato's main problem had been the organization of the perfect state, and Aristotle's intellect had ranged with fresh interest over all departments of the knowable, political speculation had become a mockery with the extinction of free political life, and knowledge as such had lost its freshness for the Greeks of the Roman Empire. Knowledge is nothing to these men if it does not show them the infinite reality which is able to fill the aching void within. Accordingly, the last age of Greek philosophy is theosophical in character, and its ultimate end is a practical satisfaction. Neoplatonism seeks this in the ecstatic intuition of the ineffable One. The systematic theosophy of Plotinus and his successors does not belong to the present article, except so far as it is the presupposition of their mysticism; but, inasmuch as the mysticism of the mediaeval Church is directly derived from Neoplatonism through the speculations of the pseudo-Dionysius, Neoplatonic mysticism fills an important section in any historical review of the subject.

Neoplatonism.—Neoplatonism appears in the first half of the 3rd century, and has its greatest representative in Plotinus. He develops the Platonic philosophy into an elaborate system by means of the doctrine of emanation. The One, the Good, and the Idea of the Good were identical in Plato's mind, and the Good was therefore not deprived of intelligible essence. It was not separated from the world of ideas, of which it was represented as either the crown or the sum. By Plotinus, on the contrary, the One is explicitly exalted above the *νοῦς* and the "ideas"; it transcends existence altogether (*ἐπέκεινα τῆς οὐσίας*), and is not cognizable by reason. Remaining itself in repose, it rays out, as it were, from its own fullness an image of itself, which is called *νοῦς*, and which constitutes the system of ideas of the intelligible world. The soul is in turn the image or product of the *νοῦς*, and the soul by its motion begets corporeal matter. The soul thus faces two ways—towards the *νοῦς*, from which it springs, and towards the material life, which is its own product. Ethical endeavour consists in the repudiation of the sensible; material existence is itself estrangement from God. (Porphyry tells us that Plotinus was unwilling to name his parents or his birthplace, and seemed ashamed of being in the body.) Beyond the *καθάρσεις*, or virtues which purify from sin, lies the further stage of complete identification with God (*οὐκ ἔξω ἁμαρτίας εἶναι, ἀλλὰ θεὸν εἶναι*). To reach the ultimate goal, thought itself must be left behind; for thought is a form of motion, and the desire of the soul is for the motionless rest which belongs to the One. The union with transcendent deity is not so much knowledge or vision as ecstasy, coalescence, *contact* (*ἔκστασις, ἅπλωσις, ἀφή, Ennead.,* vi. 9. 8–9). But in our present state of existence the moments of this ecstatic union must be few and short.

It will be seen from the above that Neoplatonism is not mystical as regards the faculty by which it claims to apprehend philosophic truth. It is first of all a system of complete rationalism; it is assumed, in other words, that reason is capable of mapping out the whole system of things. But, inasmuch as a God is affirmed beyond reason, the mysticism becomes in a sense the necessary complement of the would-be all-embracing rationalism. The system culminates in a mystical act, and in the sequel, especially with Iamblichus and the Syrian Neoplatonists, mystical practice tended more and more to overshadow the theoretical groundwork.

Dionysius Areopagiticus.—It was probably about the end of the 5th century, just as ancient philosophy was dying out in the schools of Athens, that the speculative mysticism of Neoplatonism made a definite lodgment in Christian thought through the literary forgeries of the pseudo-Dionysius (*see* DIONYSIUS AREOPAGITICUS). The doctrines of Christianity were by that time so firmly established that the Church could look upon a symbolical or mystical interpretation of them without anxiety. The author of the *Theologia mystica* and the other works ascribed to the Areopagite proceeds, therefore, to develop the doctrines of Proclus with very little modification into a system of esoteric Christianity. God is the nameless and supra-essential One, elevated above goodness itself. Hence "negative theology," which ascends from the creature to God by dropping one after another

every determinate predicate, leads us nearest to the truth. The return to God (ἕνωσις, θέωσις) is the consummation of all things and the goal indicated by Christian teaching. The same doctrines were preached with more of churchly fervour by Maximus the Confessor (580–622).

The West.—St. Maximus represents almost the last speculative activity of the Greek Church, but the influence of the pseudo-Dionysian writings were transmitted to the West in the 9th century by Erigena, in whose speculative spirit both the scholasticism and the mysticism of the middle ages have their rise. Erigena translated Dionysius into Latin along with the commentaries of Maximus, and his system is essentially based upon theirs. In Erigena mysticism has not yet separated itself in any way from the dogma of the Church. There is no revulsion, as later, from dogma as such, nor is more stress laid upon one dogma than upon another; all are treated upon the same footing, and the whole dogmatic system is held, as it were, in solution by the philosophic medium in which it is presented. No distinction is drawn, indeed, between what is reached by reason and what is given by authority; the two are immediately identical for Erigena. In this he agrees with the speculative mystics everywhere, and differentiates himself from the scholastics who followed him. The chief representatives of scholasticism aim at demonstrating that the content of revelation and the teaching of reason are identical, but this is only an equation of two things which have been dealt with on the supposition that they are separate. Mysticism, on the other hand, is marked on its speculative side by even an overweening confidence in human reason; and this is pre-eminently visible in the work of Erigena. Nor need this be wondered at if we consider that the unity of the human mind with the divine is its underlying presupposition. Hence where reason is discarded by the mystic it is merely reason overleaping itself; it occurs at the end and not at the beginning of his speculations. Even then there is no appeal to authority; nothing is accepted from without. The appeal is still to the individual, who, if not by reason then by some higher faculty, claims to realize absolute truth and to taste absolute blessedness.

Anti-dialectical.—Mysticism first appears in the mediaeval Church as the protest of practical religion against the predominance of the dialectical spirit. It is so with Bernard of Clairvaux (1090–1153), who condemns Abelard's distinctions and reasonings as externalizing and degrading the faith. St. Bernard's mysticism is of a practical cast, dealing mainly with the means by which man may attain to the knowledge and enjoyment of God. Reason has three stages, in the highest of which the mind is able, by abstraction from earthly things, to rise to *contemplatio* or the vision of the divine. More exalted still, however, is the sudden *ecstatic* vision, such as was granted, for example, to Paul. This is the reward of those who are dead to the body and the world. Asceticism is thus the counterpart of medieval mysticism; and, by his example as well as by his teaching in such passages, St. Bernard unhappily encouraged practices which necessarily resulted in self-delusion. Love grows with the knowledge of its object, he proceeds, and at the highest stage self-love is so merged in love to God that we love ourselves only for God's sake or because God has loved us. "As the little water-drop poured into a large measure of wine seems to lose its own nature entirely and to take on both the taste and the colour of the wine; or as iron heated red-hot loses its own appearance and glows like fire; or as air filled with sunlight is transformed into the same brightness so that it does not so much appear to be illuminated as to be itself light—so must all human feeling towards the Holy One be self-dissolved in unspeakable wise, and wholly transfused into the will of God. For how shall God be all in all if anything of man remains in man? The substance will indeed remain, but in another form, another glory, another power" (*De diligendo Deo*, c. 10).

Mysticism was more systematically developed by Bernard's contemporary Hugh of St. Victor (1096–1141). The Augustinian monastery of St. Victor near Paris became the headquarters of mysticism during the 12th century. It had a wide influence in awakening popular piety, and the works that issued from it formed the textbooks of mystical and pietistic minds in the centuries that followed. Hugh's pupil, Richard of St. Victor, declares, in opposition to dialectic scholasticism, that the objects of mystic contemplation are partly above reason, and partly, as in the intuition of the Trinity, contrary to reason. He enters at length into the conditions of ecstasy and the yearnings that precede it. Bonaventura (1221–1274) was a diligent student of the Victorines, and in his *Itinerarium mentis ad Deum* maps out the human faculties in a similar fashion. He introduces the terms "apex mentis" and "scintilla" (also "synderesis" or συντήρησις) to describe the faculty of mystic intuition. Bonaventura runs riot in phrases to describe the union with God, and his devotional works were much drawn upon by mystical preachers.

Theology of the Heart.—From the 12th and 13th centuries onward there is observable in the different countries of Europe a widespread reaction against the growing formalism and worldliness of the Church and the scandalous lives of many of the clergy. Men began to feel a desire for a theology of the heart and an unworldly simplicity of life. In the beginning of the 13th century the foundation of the Dominican and Franciscan orders furnished an ecclesiastical and regular means of supplying the same wants, and numerous convents sprang up at once throughout Germany. The German mind was a peculiarly fruitful soil for mysticism, and a number of women appear about this time, combining a spirit of mystical piety and asceticism with sturdy reformatory zeal directed against the abuses of the time. Even before this we hear of the prophetic visions of Hildegard of Bingen (a contemporary of St. Bernard) and Elizabeth of Schönau. In the 13th century Elizabeth of Hungary, the pious landgravine of Thuringia, assisted in the foundation of many convents in the north of Germany. (For an account of the chief of these female saints *see* the first volume of W. Preger's *Geschichte der deutschen Mystik.*) Mechthild of Magdeburg appears to have been the most influential, and her book *Das fliessende Licht der Gottheit* is important as the oldest work of its kind in German. It proves that much of the terminology of German mysticism was current before Eckhart's time. Mechthild's clerico-political utterances show that she was acquainted with the "eternal gospel" of Joachim of Floris. Joachim had proclaimed the doctrine of three world-ages—the kingdom of the Father, of the Son, and of the Spirit. The reign of the Spirit was to begin with the year 1260, when the abuses of the world and the Church were to be effectually cured by the general adoption of the monastic life of contemplation.

Very similar to this in appearance is the teaching of Amalric of Bena (d. 1207); but, while the movements just mentioned were reformatory without being heretical, this is very far from being the case with the mystical pantheism derived by Amalric from the writings of Erigena. His followers held a progressive revelation of God in the ages of the Father, Son and Holy Spirit. Just as the Mosaic dispensation came to an end with the appearance of Christ, so the sacraments of the new dispensation have lost their meaning and efficacy since the incarnation of God as Holy Spirit in the Amalricans. With this opposition to the Church they combine a complete antinomianism, through the identification of all their desires with the impulses of the divine Spirit. Amalric's teaching was condemned by the Church, and his heresies led to the public burning of Erigena's *De divisione naturae* in 1225.

Eckhart.—In Meister Eckhart (? 1260–1327) the German mind definitively asserts its pre-eminence in the sphere of speculative mysticism. Eckhart was a distinguished son of the Church; but in reading his works we feel at once that we have passed into quite a different sphere of thought from that of the churchly mystics; we seem to leave the cloister behind and to breathe a freer atmosphere. The scholastic mysticism was, for the most part, practical and psychological in character. It was largely a devotional aid to the realization of present union with God; and, so far as it was theoretical, it was a theory of the faculties by which such a union is attainable. But in Eckhart the attitude of the churchman and traditionalist is entirely abandoned. His system enables him to give a profound significance to the doctrines

of the Church; but, instead of the system being accommodated to the doctrines, the doctrines—and especially the historical facts—acquire a new sense in the system, and often become only a mythical representation of speculative truth.

The political circumstances of Germany in the first half of the 14th century were in the last degree disastrous. The war between the rival emperors, Frederick of Austria and Louis of Bavaria, and the interdict under which the latter was placed in 1324 inflicted extreme misery upon the unhappy people. From some places the interdict was not removed for twenty-six years. Men's minds were pained and disquieted by the conflict of duties and the absence of spiritual consolation. The country was also visited by a succession of famines and floods, and in 1348 the Black Death swept over Europe like a terrible scourge. In the midst of these unhappy surroundings religion became more inward in men of real piety and the desire grew among them to draw closer the bonds that united them to one another. Thus arose the society of the Friends of God (*Gottesfreunde*) in the south and west of Germany, spreading as far as Switzerland on the one side and the Netherlands on the other. They formed no exclusive sect. They often took opposite sides in politics and they also differed in the type of their religious life; but they uniformly desired to strengthen one another in living intercourse with God. Among them chiefly the followers of Eckhart were to be found. Such were Heinrich Suso of Constance (1295–1366) and Johann Tauler of Strasbourg (1300–1361), the two most celebrated of his immediate disciples. It was doubtless one of the Friends who sent forth anonymously from the house of the Teutonic Order in Frankfort the famous handbook of mystical devotion called *Eine deutsche Theologie,* first published in 1516 by Luther..

Jan van Ruysbroeck (1294–1381), the father of mysticism in the Netherlands, stood in connection with the Friends of God, and Tauler is said to have visited him in his seclusion at Groenendal near Brussels. He was decisively influenced by Eckhart, though there is noticeable occasionally a shrinking back from some of Eckhart's phraseology. Ruysbroeck's mysticism is more of a practical than a speculative cast. He is chiefly occupied with the means whereby the *unio mystica* is to be attained, whereas Eckhart dwells on the union as an ever-present fact, and dilates on its metaphysical implications. Towards the end of Ruysbroeck's life, in 1378, he was visited by the fervid lay-preacher Gerhard Groot (1340–1384), who was so impressed by the life of the community at Groenendal that he conceived the idea of founding a Christian brotherhood, bound by no monastic vows, but living together in simplicity and piety with all things in common, after the apostolic pattern. This was the origin of the Brethren of the Common Lot (or Common Life). The first house of the Brethren was founded at Deventer by Gerhard Groot and his youthful friend Florentius Radewyn; and here Thomas à Kempis (*q.v.*) received his training. Similar brother-houses soon sprang up in different places throughout the Low Countries and Westphalia, and even Saxony.

Mystics and the Reformation.—It has been customary for Protestant writers to represent the mystics of Germany and Holland as precursors of the Reformation. In a sense this is true. But it would be false to say that these men protested against the doctrines of the Church in the way the Reformers felt themselves called upon to do. There is no sign that Tauler, for example, or Ruysbroeck, or Thomas à Kempis had felt the dogmatic teaching of the Church jar in any single point upon their religious consciousness. Nevertheless, mysticism did prepare men in a very real way for a break with the traditional system. Mysticism instinctively recedes from formulas that have become stereotyped and mechanical. On the other hand its claim for spiritual freedom was soon to be found in opposition also to the Reformers. The wild doctrines of Thomas Münzer and the Zwickau prophets, merging eventually into the excesses of the Peasants' War and the doings of the Anabaptists in Münster, first roused Luther to the dangerous possibilities of mysticism as a disintegrating force. He was also called upon to do battle for his principle against men like Caspar Schwenkfeld (1490–1561) and Sebastian Franck (*c.* 1499–*c.* 1543), the latter of whom developed a system of pantheistic mysticism, and went so far in his opposition to the letter as to declare the whole of the historical element in Scripture to be but a mythical representation of eternal truth. Valentin Weigel (1533–1588), who stands under manifold obligations to Franck, represents also the influence of the semi-mystical speculation that marked the transition from scholasticism to modern times. The final breakdown of scholasticism as a rationalized system of dogma may be seen in Nicolas (or Nicolaus) of Cusa (1401–1464), who insists that all real apprehension of God is by way of a "knowledge above knowledge." The influence of later mediaeval mysticism is seen in Jacob Boehme (1575–1624).

Other Forms of Mysticism.—Mysticism did not cease within the Catholic Church at the Reformation. In St. Theresa (1515–1582) and John of the Cross the counter-reformation can boast of saints second to none in the calendar for the austerity of their mortifications and the rapture of the visions to which they were admitted. But, as was to be expected, their mysticism moves in that comparatively narrow round, and consists simply in the heaping up of these sensuous experiences. The speculative character has entirely faded out of it, or rather has been crushed out by the tightness with which the directors of the Roman Church now held the reins of discipline. The gloom and harshness of these Spanish mystics are absent from the tender, contemplative spirit of François de Sales (1567–1622); and in the quietism of Mme. Guyon (1648–1717) and Miguel de Molinos (1627–1696) there is again a sufficient implication of mystical doctrine to rouse the suspicion of the ecclesiastical authorities.

In the 17th century mysticism is represented in the philosophical field by the so-called Cambridge Platonists, and especially by Henry More (1614–1687), in whom the influence of the Kabbalah is combined with a species of Christianized Neoplatonism. Pierre Poiret (1646–1719), an ardent student of Tauler and Thomas à Kempis, exhibits a violent reaction against the mechanical philosophy of Descartes, and especially against its consequences in Spinoza. The first influence of Boehme was in the direction of an obscure religious mysticism. J. G. Gichtel (1638–1710), the first editor of his complete works, became the founder of a sect called the Angel-Brethren. All Boehme's works were translated into English in the time of the Commonwealth, and regular societies of Boehmenists were formed in England and Holland. Later in the century he was much studied by the members of the Philadelphian Society, John Pordage, Thomas Bromley, Jane Lead, and others. The mysticism of William Law (1686–1761) and of Louis Claude de Saint Martin in France (1743–1803), who were also students of Boehme, is of a much more elevated and spiritual type. The "Cherubic Wanderer," and other poems, of Johann Scheffler (1624–1677), known as Angelus Silesius, are more closely related in style and thought to Eckhart than to Boehme.

The religiosity of the Quakers, with their doctrines of the "inner light" and the influence of the Spirit, has decided affinities with mysticism; and the autobiography of George Fox (1624–1691), the founder of the sect, proceeds throughout on the assumption of supernatural guidance. Stripped of its definitely miraculous character, the doctrine of the inner light may be regarded as the familiar mystical protest against formalism, liberalism, and scripture-worship. Swedenborg, though selected by Emerson in his *Representative Men* as the typical mystic, belongs rather to the history of spiritualism than to that of mysticism as understood in this article. He possesses the cool temperament of the man of science rather than the fervid Godward aspiration of the mystic proper; and the speculative impulse which lies at the root of this form of thought is almost entirely absent from his writings. Accordingly, his supernatural revelations resemble a course of lessons in celestial geography more than a description of the beatific vision.

Analysis.—The term mysticism is often extended by popular usage and philosophical partisanship to the whole activity of the German idealistic thinkers who followed Kant; but this looseness of phraseology only serves to blur important distinctions. However absolute a philosopher's idealism may be, he is erroneously styled a mystic if he moves towards his conclusions only by the

patient labour of the reason. Hegel therefore, to take an instance, can no more fitly be classed as a mystic than Spinoza can. It would be much nearer the truth to take both as types of a thoroughgoing rationalism. In either case it is of course open to anyone to maintain that the apparent completeness of synthesis really rests on the subtle intrusion of elements of feeling into the rational process. But in that case it might be difficult to find a systematic philosopher who would escape the charge of mysticism; and it is better to remain by long-established and serviceable distinctions.

So, again, when Récéjac defines mysticism as "the tendency to draw near to the Absolute in moral union by symbolic means," the definition, as developed by him, is one which would apply to the philosophy of Kant. Récéjac's interesting work, *Les Fondements de la connaissance mystique* (Eng. trans. 1899), though it touches mysticism at various points, and quotes from mystic writers, is in fact a protest against the limitations of experience to the data of the senses and the pure reason to the exclusion of the moral consciousness and the deliverances of "the heart." But such a position is not describable as mysticism in any recognized sense. On the other hand, the term is in place where the movement of revulsion from a mechanical philosophy takes the form rather of immediate assertion than of reasoned demonstration, and where the writers, after insisting generally on the spiritual basis of phenomena, either leave the position without further definition or expressly declare that the ultimate problems of philosophy cannot be reduced to articulate formulas. Examples of this are men like Novalis, Carlyle and Emerson, in whom philosophy may be said to be impatient of its own task.

Modern Studies.—Study of the subject may be said to begin with Dean Inge's Bampton Lectures on Christian Mysticism (1899). It has since been pursued along the parallel routes of psychology, history and philosophy of religion, with the result that the claim of mysticism to be regarded as a genuine form of human experience is justified. These aspects of mysticism cannot rigidly be separated, or indeed understood in isolation, each being of vital importance to the rest.

William James, in his epoch-making Gifford Lectures on *The Varieties of Religious Experience* (1902), originated the serious study of mysticism, especially from the psychological point of view, and attempted to discover its relation to other forms of consciousness. Although based on material chosen from too restricted a field, the publication of this book revolutionised the attitude of students towards religious psychology. The conception of the subconscious was now first used to provide an explanation and sanction for the ecstatic and other abnormal phenomena found in connection with mysticism, and an attempt was made to distinguish the accompaniments of genuine religious apprehension from their pathological imitations.

These researches have continued vigorously, especially in America and France. Pratt's *Religious Consciousness* (1921) represents the matured result of the movement started by James. Considerable advance has been made towards the correlation and better understanding of such types as the prophet, visionary and religious revivalist, in all of whom a strong mystical impulse is commonly at work. The hostile study of mysticism from the psychological standpoint has its chief exponent in J. H. Leuba, and to some extent in the work of experimental psychologists such as P. Janet, whilst an approach midway between the philosophical and psychological is provided by Bucke's *Cosmic Consciousness*, a curious work which has exercised considerable influence. Delacroix's sympathetic but penetrating analyses of the evolution of the great mystics have shed much light on the psychological characteristics of religious genius. Valuable studies of the nature of mystical contemplation, and restatement in modern terms of its processes, have been produced by Roman Catholic scholars, the best being those of Père Poulain, S.J.

Influence of Psychology.—The psychological study of mystical phenomena has illuminated many historical problems, especially those connected with prophecy and the origins of religious movements. The treatment of the subject in such works as Heiler's *Das Gebet* and *Der Katholizismus* or Brémond's monumental *Histoire du Sentiment religieux en France,* is symptomatic of the changed outlook. Material available for students of historical mysticism has been much enriched. Good texts and translations of many masterpieces of European mysticism have appeared, with valuable studies such as those of Abbot Butler and Rufus Jones, based on the historical method.

The changed outlook of physical science, the new understanding of its limitations and the marked revolt from 19th-century materialism, have brought about a *rapprochement* between mysticism and philosophy. Inge's *Philosophy of Plotinus* (1918) and Otto's widely discussed essay *Das Heilige* (The Idea of the Holy, 1924) show different aspects of the reaction of philosophy to mysticism. But this is also felt in the pure metaphysics of Wittgenstein, and in the inimical attitude of Croce and his school. The greatest and ultimately most influential expositions of the place of mysticism in theistic philosophy, and its limitations and rightful relation with other aspects of knowledge, are Von Hügel's *Mystical Element of Religion* and *Eternal Life.* These books have affected all modern religious thinkers, and may provide the starting-point of a critical realism harmonising the mystical, moral and intellectual approaches to reality. In America, Hocking's *Meaning of God in Human Experience* is probably the most important philosophic contribution to this subject.

Modern Practical Mysticism.—The first quarter of the 20th century saw, especially in France, a revival of genuine Christian mysticism; possibly the beginning of what later historians may recognise as a "mystical epoch." Its most impressive document is the *Spiritual Journal* of the lady known as Lucie-Christine (1844–1908), a record which bears comparison with the historical classics of mysticism. Its most striking product is the career of the hermit saint of the Sahara, Charles de Foucauld (1858–1916). These stand out among a number of more obscure personalities, such as Elizabeth de la Trinité (1880–1906) and Madeleine Sémer (1874–1921), all of whom claim and describe with a conviction and sobriety compelling respect the characteristic mystical experience and certitude. From India, the autobiography of the saintly Hindu theist Maharshi Devendranath Tagore (1817–1905), and the experiences of the Christian convert Sadhu Sundar Singh (born 1889), whose career and personality have made a widespread impression, provide unspoilt examples of first-hand mysticism, and deepen the sense of unity in the spiritual intuitions.

The revived interest in mysticism has had popular results in several directions. It has seemed to endorse the shallow eclecticism in which many escape the difficulties of belief. Its superficial peculiarities have been exploited by theosophists and other apostles of eccentric religiosity. It has produced numerous bastard cults, mostly hailing from America though often wearing Oriental disguise; cults mainly compounded of pantheism, quietism and crude autosuggestion, and offering a "mystical religion" to those seeking a spiritual home full of modern conveniences and devoid of discipline. On the other hand, its spirit has affected for good the literature and activity of the organised Churches; shifting the emphasis from tradition to experience, and bringing back into focus those mysterious realities which religious symbols and institutions seek to express.

schichte der Deutschen Mystik (1874–93). *See* also articles on the greater mystical writers named. (A. S. P.-P.; E. Un.; X.)

MYTH AND RITUAL. The fundamental association of myth with ritual emerges clearly in the view of Robertson Smith, that in all antique religions mythology takes the place of dogma. He thought that mythology was no essential part of ancient religion for it had no sacred sanction and no binding force on the worshippers. Belief in myths was not obligatory as a part of true religion. He argued that, from the outset, ritual and practical usage were strictly speaking, the sum total of ancient religions. Political institutions are older than political theories and in like manner religious institutions are older than religious theories. Dr. Cook (*Religion of the Semites,* 3rd Edn. 1927) points out that myth and ritual often act upon each other. Some, he thinks, are based upon misunderstandings, are explanations of explanations, are the product of the more intelligent and sophisticated individuals, or have been purified of earlier crudities, while fancy and imagination have transformed them. While myths are specifically of personal interest, in general they appeal to the different types of mind in mixed communities. The views of Robertson Smith have assumed a more precise shape in the argument of Professor Radcliffe-Brown that "it is necessary to take into account the explanations given by the natives themselves. Although these explanations are not of the same kind as the scientific explanations that are the objects of research, yet they are of great importance as data. Like the civilized man of Western Europe, the savage of the Andamans seeks to rationalise his behaviour; being impelled to certain actions by mental dispositions of whose origin and real nature he is unaware, he seeks to formulate reasons for his conduct, or even if he does not when left to himself, he is compelled to when the enquiring ethnologist attacks him with questions. Such a reason as is produced by this process of rationalisation is rarely, if ever, identical with the psychological cause of the action that it justifies, yet it will nearly always help us in our search for the cause. At any rate, the reason given as explaining the action is so intimately connected with the action itself that we cannot regard any hypothesis as to the meaning of a custom as being satisfactory unless it explains, not only the custom, but also the reasons that the natives give for following it. . . . Tales that might seem merely the products of a somewhat childish fancy are very far indeed from being merely fanciful and are the means by which the Andamanese express and systematise their fundamental notions of life and nature and the sentiments attaching to these notions." (A. Radcliffe-Brown, *The Andaman Islanders,* pp. 234 and 330, 1922.)

The process of symbolic thought is of important reference to and criticism of the interpretation of "the beliefs of savages as being the result of attempts to *understand* natural facts such as dreams, death, birth, etc. Such writers assume that the savage is impelled by the same motive that so strongly dominates themselves, the desire to understand—scientific curiosity, and that such beliefs as animism or totemism are in the nature of scientific hypothesis, invented to explain the facts of dreaming and of death on the one hand, and of conception and birth on the other. If this view of the nature of primitive thought were correct it would be impossible to conceive how such inconsistencies as those that were met with among the Andamanese could be permitted. On the view that the myths of primitive society are merely the result of an endeavour to express certain ways of thinking and feeling about the facts of life which are brought into existence by the manner in which life is regulated in society, the presence of such inconsistencies need not in the least surprise us, for the myths satisfactorily fulfil their function, not by any appeal to the reasoning powers but by appealing, through the imagination, to the mind's affective dispositions." (A. Radcliffe-Brown, *The Andaman Islanders,* 1922, p. 397.)

Malinowski insists that "the function of myth, briefly, is to strengthen tradition and endow it with a greater value and prestige by tracing it back to a higher, better, more supernatural reality of ancient events." From myth spring the epic romance and tragedy. Myth, therefore, touches the deepest desires of man—his fears, his hopes, his passions, his sentiments as it validates the social order, justifies the existing social scheme and ranges from expressions of sheer artistry to legalism. (*Myth in Primitive Psychology,* 1927.)

MYTHOLOGY, the science which examines μῦθοι, myths or legends of cosmogony and of gods and heroes. Mythology is also used as a term for these legends themselves. Thus when we speak of "the mythology of Greece" we mean the whole body of Greek divine and heroic and cosmogonic legends. When we speak of the "science of mythology" we refer to the various attempts which have been made to explain these ancient narratives. Very early indeed in the history of human thought men awoke to the consciousness that their religious stories were much in want of explanation. The myths of civilized peoples, as of the Aryans of India and the Greeks, contain two elements, the rational and what to modern minds seems the irrational. The rational myths are those which represent the gods as beautiful and wise. The real difficulties of mythology spring from the irrational element, which to modern minds appears senseless or repellent.

Classical mythology is discussed under Greek Religion; Roman Religion and Odysseus; Theseus; Orpheus. For other mythology consult Animism; Totemism; Lycanthropy; Metempsychosis, etc.; *see* Religion and Theology, Articles on.

MYXINE, a genus of cyclostome fishes known as slime eels. They are closely related to the hagfishes, differing in having a single external gill-opening. They have similar parasitic habits. (*See* Hagfish; Cyclostomata.)

MYXOEDEMA, the medical term for a constitutional disease (*see* Metabolic Diseases) caused by a deficiency or hypofunction of the thyroid gland, and occurring in adults; cretinism is essentially the same condition appearing in early childhood. There are two forms, myxoedema proper and operative myxoedema (*cachexia strumipriva*). (1) Myxoedema was termed "Gull's Disease" from Sir William Gull's observations in 1873. Women are more often the victims than men, in a ratio of six to one. It frequently affects members of the same family and may be transmitted through the mother; it has been observed sometimes to follow exophthalmic goitre. The symptoms are a marked increase in bulk and weight of the body, puffy appearance of skin which does not pit on pressure, the line of the features becoming obliterated and getting coarse and broad, the lips thick and nostrils enlarged, with loss of hair, subnormal temperature and marked mental changes. There is striking slowness of thought and action, the memory becomes defective, and the patient becomes irritable and suspicious. In some instances the condition progresses to that of dementia. The basal metabolic rate is very low. The thyroid gland itself is diminished in size, and may become completely atrophied and converted into a fibrous mass. The untreated disease is progressive, but the course is slow and the symptoms may extend over 12 to 15 years, death from asthenia or tuberculosis being the most frequent ending. (2) Symptoms similar to the above may follow complete removal of the thyroid gland. Kocher of Berne found that, in the total removal of the gland by operation, out of 408 cases operative myxoedema occurred in 69, but it is thought that if a small portion of the gland is left, or if accessory glands are present, these symptoms will not develop. The treatment of myxoedema, like that of cretinism, is by administration of thyroid extract.

N

IN all known alphabets the letter N has stood in close connection with M, the particular form of one being generally reflected in the other. Semitic (*nun*) and Greek (*nu*) are its predecessors. In the inscriptions from Thera the form was consistently . Other forms were from Corinth and N in the Ionic alphabet of Abu-Simbel. In the Lydian alphabet the form was , Etruscan has sometimes the curious form corresponding to its five-stroked (M). In the Italic alphabets the form of the letter followed that of M, being found in Umbrian as , in Oscan as and in Faliscan as . The Latin forms were N and .

The minuscule cursive form of the 6th century was , probably accounted for by the writing of the letter without taking the pen from the paper commencing at the top of the left-hand vertical stroke. This would cause the oblique stroke to rise from left to right instead of being downward in direction. The Carolingian hand developed the rounded minuscule form . From this derives the modern minuscule. The sound that the letter has represented throughout its history is the dental nasal, the nasals being of all sounds the least liable to change. (B. F. C. A.)

DEVELOPMENT OF THE LETTER "N" FROM THE EARLIEST TIMES TO THE PRESENT DAY

NABATAEANS, a people of ancient Arabia, whose settlements gave the name of Nabatene to the border-land between Syria and Arabia from the Euphrates to the Red sea. The history of the Nabataeans cannot be carried back beyond 312 B.C., at which date they were attacked without success by Antigonus I. (*Cyclops*) in their mountain fortress of Petra.

The Nabataeans were Arabs—as their proper names show—who came under Aramaic influence. They wrote a letter to Antigonus "in Syriac letters," and Aramaic continued to be the language of their coins and inscriptions when the tribe grew into a kingdom, and profited by the decay of the Seleucids to extend its borders northward over the more fertile country east of the Jordan. They occupied Haurān, and about 85 B.C. their king Aretas (Ḥārīthath) became lord of Damascus and Coele-Syria. Allies of the first Hasmonaeans in their struggles against the Greeks (i. Macc. v. 25, ix. 35; 2 Macc. v. 8), they became the rivals of the Judaean dynasty in the period of its splendour, and a chief element in the disorders which invited Pompey's intervention in Palestine. The Roman arms were not very successful, and King Aretas retained his whole possessions, including Damascus, as a Roman vassal. (*cf.* 2 Cor. xi. 32). As "allies" of the Romans the Nabataeans continued to flourish throughout the first Christian century. Their power extended far into Arabia, particularly along the Red sea; and Petra was a meeting-place of many nations, though its commerce was diminished by the rise of the Eastern trade-route from Myoshormus to Coptos on the Nile. A sober, acquisitive, orderly people, wholly intent on trade and agriculture (Strabo, xvi. 4), they might have long been a bulwark between Rome and the wild hordes of the desert but for the short-sighted cupidity of Trajan, who reduced Petra and broke up the Nabataean nationality (A.D. 105). (*See* SEMITIC LANGUAGES.) (W. R. S.; S. A. C.)

NABBES, THOMAS (b. 1605), English dramatist, was born in humble circumstances in Worcestershire. He entered Exeter College, Oxford, in 1621, but left the university without taking a degree, and about 1630 began a career in London as a dramatist.

Nabbes's plays were collected in 1639; and *Microcosmus* was printed in Dodsley's *Old Plays* (1744). All his works, with the exception of his continuation of Knolles's history, were reprinted by A. H. Bullen in his *Old English Plays* (second series, 1887). *See* also F. G. Fleay, *Biog. Chron. of the English Drama* (1891).

NABHA, an Indian state, within the Punjab. Area 947 sq.mi. Pop. (1941) 340,044. Its territories are scattered; one section with twelve separate tracts, lies among the territories of Patiala and Jind, in the east and south of the Punjab; the other section is in the extreme southeast. Nabha is one of the Sikh states, founded by a member of the Phulkian family, which established its independence about 1763. In 1807–1808, the raja obtained British protection against threatened encroachments of Ranjit Singh. During the Mutiny in 1857 the raja showed distinguished loyalty, and was rewarded by grants of territory to the value of over £10,000. The state also did good service during World War I. The ruler in 1944 was Maharaja Pratap Singh Malvendra Bahadur (born 1919), who succeeded in 1928. He has a salute of 13 guns. The average revenue is £212,000.

The town of Nabha, founded in 1755, has a station on the North-Western railway. Population (1941) 12,704.

NÁBIGHA DHUBYÁNÍ [Ziyād ibn Muʻawīyya] (6th and 7th centuries), Arabian poet, was one of the last pre-Islamic poets.

He lived at the courts of Hira and Ghassān. In Hira he remained under Mondhir (Mundhir) III and his successor. After a sojourn at the court of Ghassān, he returned to Hira under Nu'mān. He was compelled to flee to Ghassān, but returned again about 600. About 605 he withdrew to his own tribe. The date of his death is uncertain. He wrote mainly eulogies and satires concerned with the strife of Hira and Ghassān, and of the Bani Abs and the Bani Dhubyān. He is one of the six pre-Islamic poets whose poems were collected before the middle of the 2nd century of Islam.

His poems have been edited by W. Ahlwardt in the *Diwans of the Six Ancient Arabic Poets* (London, 1870), and separately by H. Derenbourg (Paris, 1869, a reprint from the *Journal asiatique* for 1868). (G. W. T.)

NABIS, tyrant of Sparta, seized the throne after Sparta's heavy defeat by the Achaean League in 207 B.C. He seems to have put into practice the "four points" of the revolutionary programme of the day, abolition of debt, division of land, confiscation of personal property and liberation of slaves, though he does not appear to have tackled the Helot problem very completely. Whether he was the monster of cruelty represented by Polybius it is difficult to say. No revolutionary leader gets fair play from contemporary historians as a rule, and few revolutionary leaders can afford very gentle measures. In any case, he carried out more thoroughly the aims of Agis and Cleomenes, and extended his system to Argos, which was put into his hands by Philip V in 198. The Achaeans under Philopoemen first attacked him in 201, and defeated him at Scotitas. Later in 195 B.C. after the conclusion of the war with Philip the Romans under Flamininus turned their attention to the affairs of Greece. The League was unanimous for war against Nabis, and Flamininus duly undertook it. Nabis organized a vigorous defense, and raised an army of 10,000 from Sparta with the help of the enfranchised Helots. After some desultory fighting and a good deal of negotiation, Nabis obtained peace at the price of losing Argos and some harbours, and the internal affairs of Sparta were left undisturbed. As soon as the Romans had gone Nabis was embroiled with the Achaeans again. He was eventually murdered by some Aetolian auxiliaries, and Philopoemen ruthlessly suppressed one of the few whole-hearted attempts at social revolution in Greek history.

See Plutarch, *Philopoemen;* Polyb. xiii–xx; Paus. iv–viii; Liv. 31–35; W. W. Tarn, in *The Hellenistic Age* (Cambridge, 1923), and *Hellenistic Civilization* (1927).

NABOB, a corruption of the word *nawab,* a native Indian ruler. In the 18th century it was sarcastically applied to Englishmen who returned with fortunes from the east.

Bibliography.—H. H. Dodwell, *The Nabobs of Madras* (London, 1926); T. G. P. Spear, *The Nabobs* (Oxford, 1932); J. M. Holzman, *The Nabobs in England* (1926).

NABUA, a municipality (with administrative centre and 17 *barrios* or districts) in the extreme south of the province of Camarines Sur, Luzon, Philippine Islands, on the Bikol river, a short distance north of Lake Bato. Pop. (1939) 29,433; one was white. The surrounding country produces palay (rice), maize (corn), sugar and pepper.

NACHTIGAL, GUSTAV (1834–1885), German explorer in Central Africa, son of a Lutheran pastor, was born at Eichstedt in the Mark of Brandenburg, on Feb. 23, 1834. After studying medicine at the universities of Halle, Würzburg and Greifswald he practised for some years as a military surgeon. He went to Algiers and Tunis in search of health, and took part, as a surgeon, in several expeditions into the interior. The king of Prussia sent him on a mission to the sultan of Bornu in 1869. He visited Tibesti and Borku, regions of the central Sahara then unknown to Europeans. From Bornu he went to Bagirmi, and, proceeding by way of Wadai and Kordofan, arrived at Khartum in the winter of 1874. His journey, graphically described in his *Sahara und Sudan* (3 vols., 1879–89), placed the intrepid explorer in the front rank of discoverers. Nachtigal was consul-general for the German empire at Tunis until 1884, when he was sent by Bismarck to West Africa as special commissioner, ostensibly to enquire into the condition of German commerce, but really to annex territories to the German flag. As the result of his mission Togoland and Cameroon were added to the German empire. On his return voyage he died at sea off Cape Palmas on April 20, 1885.

NADEN, CONSTANCE CAROLINE WOODHILL (1858–1889), English author, was born at Edgbaston, Birmingham, on Jan. 24, 1858, her father being an architect. In 1881 she published *Songs and Sonnets of Springtime;* in 1887, *A Modern Apostle, and other Poems.* W. E. Gladstone included her, in an article in the *Speaker,* among the foremost English poetesses of the day. She died on Dec. 23, 1889. After 1876 she had paid increasing attention to philosophy, with her friend Dr. Robert Lewins, and the two had formulated a system of their own, which they called "Hylo-Idealism." Her main ideas on the subject are contained in a posthumous volume of her essays (*Induction and Deduction,* 1890), edited by Dr. Lewins.

NADIA, a district of India, in the Presidency division of Bengal. Area, 2,879 sq.mi.; pop. (1941) 1,759,846. Standing at the head of the Gangetic delta, Nadia is an alluvial plain, the level of which has been raised by deposits of silt, so that it is subject to inundation only in years of high flood. Along the north-eastern boundary flows the main stream of the Ganges or Padma, of which the remaining rivers of the district are offshoots. The Bhagirathi on the eastern border, and the Jalangi and the Matabhanga meandering through the centre of the district, are the chief of those offshoots, called distinctively the "Nadia rivers." In former times the Nadia rivers afforded a regular means of communication between the Ganges and the seaboard; but the levels of the river beds have risen and, except in the rains, the rivers have diminished into shallow streams. The land no longer receiving a fertilizing deposit of silt, the productiveness of the soil has been reduced; this, with obstructed drainage and consequent epidemics of fever, has caused a gradual loss of population. Rice is the staple crop; but the district is not as a whole fertile, the soil being sandy. The manufacture of molasses from the juice of date palms is the principal industry.

The headquarters of the district are at Krishnagar (pop. [1941] 32,016), which contains the residence of the Maharajah of Nadia.

Nabadwip or Nadia was formerly situated on the east bank of the Bhagirathi, which has since changed its course. Population (1941) 30,583. It is celebrated for its capture by the Mohammedans in the 12th century, for the sanctity and learning of its pundits, and as the birthplace of Chaitanya, the Vaishnava reformer.

NADIR, a term used in astronomy for the point in the heavens exactly opposite to the zenith, the zenith and nadir being the two poles of the horizon; that is, the zenith is directly overhead, the nadir directly under foot. It is also used figuratively of the lowest point in a career.

NADIR SHAH GHAZI, MOHAMMED (1880–1933), King of Afghanistan, born April 10, 1880. After abdication of Amanullah (*q.v.*) in 1929, Nadir Shah defeated Habibullah, who had seized the throne, and became king. In 1933 he was assassinated. His son, Mohammed Zahir Shah, succeeded him.

NAEGELI, KARL WILHELM VON (1817–1891), Swiss botanist, was born on March 26, 1817, near Zürich. He studied botany under A. P. de Candolle at Geneva, graduated at Zürich in 1840, then devoted himself to the microscopical study of plants. Soon after graduation he became *Privatdozent* and subsequently professor extraordinary, in the University of Zürich. He was later called to fill the chair of botany in the universities of Freiburg (1852), and Munich (1858), where he died on May 10, 1891.

Naegeli made many important and varied discoveries. He extended Robert Brown's discovery of the nucleus to the principal families of Cryptogams and asserted that it is present in all plants. He investigated the "mucous layer" (*Schleimschicht*) in cells and showed this to be the living matter of the cell. This discovery was made independently and at the same time by Hugo von Mohl, who called the living substance "protoplasm." Naegeli also investigated the mode of growth in a large number of plants belonging to the algae, mosses, liverworts and angiosperms. He discovered the spermatozoids and antheridia of ferns. He also wrote papers on the anatomy of vascular plants and on the structure,

development and various forms of starch grains. In his last book he introduced the idea of a substance which he called "idioplasm" as the definite material basis of heredity.

Among his more important contributions to science were a series of papers in the *Zeitschrift für wissenschaftliche Botanik* (1844–46); *Die neuern Algensysteme* (1847); *Gattungen einzelliger Algen* (1849); *Pflanzenphysiologische Untersuchungen* (1855–58), with C. E. Cramer; *Beiträge zur wissenschaftlichen Botanik* (1858–68); a number of papers contributed to the Royal Bavarian academy of sciences, forming three volumes of *Botanische Mitteilungen* (1861–81); and, finally, his volume, *Mechanisch-physiologische Theorie der Abstammungslehre*, published in 1884.

Biographies of Naegeli are to be found in *Nature*, Oct. 16, 1891, and in *Proc. Roy. Soc.*, vol. li; see also C.-Ed. Cramer, *Leben und Wirken von Carl von Naegeli* (1896).

NAEVIUS, GNAEUS (*c.* 264–? 194 B.C.), Latin epic poet and dramatist. From a phrase in Gellius (i. 24. 1.) it has been inferred that he was born in a colony in Campania, but it seems just as probable that he was a Roman citizen. He served in the First Punic War. His career as a dramatic author began with the exhibition of a drama in or about the year 235, and continued for 30 years. Towards the close he incurred the hostility of some of the nobility, especially, it is said, of the Metelli, by the attacks which he made upon them on the stage, and at their instance he was imprisoned (Plautus, *Mil. Glor.* 211). After writing two plays during his imprisonment, in which he is said to have apologized for his former rudeness (Gellius iii. 3. 15), he was liberated through the interference of the tribunes of the commons; but he had shortly afterwards to retire from Rome (in or about 204) to Utica. His epic may have been written during his exile. Probably his latest composition was the epitaph already referred to, written like the epic in Saturnian verse:—

"Immortales mortales si foret fas flere,
Flerent divae Camenae Naevium poetam;
Itaque postquam est Orci traditus thesauro
Obliti sunt Romai loquier lingua Latina"[1]

Like Livius, Naevius professed to adapt Greek tragedies and comedies to the Roman stage. Among the titles of his tragedies are *Aegisthus, Lycurgus, Andromache* or *Hector Proficiscens, Equus Trojanus,* the last named being performed at the opening of Pompey's theatre (55). But he also produced at least two specimens of the *fabula praetexta* (national drama) one founded on the childhood of Romulus and Remus (*Lupus* or *Alimonium Romuli et Remi*), the other called *Clastidium,* which celebrated the victory of M. Claudius Marcellus over the Celts (222). But it was as a writer of comedy that he was most famous. He is placed in the canon of the grammarian Volcacius Sedigitus third (immediately after Caecilius and Plautus) in the rank of Roman comic authors. He is there characterized as ardent and impetuous in character and style. He is also appealed to as a master of his art in one of the prologues of Terence. His comedy, like that of Plautus, seems to have been rather a free adaptation of his originals than a rude copy of them, as those of Livius probably were, while the titles of most of them, like those of Plautus, are Latin. He used the stage, as it had been used at Athens, as a political arena, and his sympathies are strongly popular and anti-Senatorial. Among the few lines still remaining from his lost comedies, we seem to recognize the idiomatic force and rapidity of movement characteristic of the style of Plautus. There is also found that love of alliteration which is a marked feature in all the older Latin poets. In one considerable comic fragment attributed to him—the description of a coquette—there is great truth and shrewdness of observation. But we find no trace of the exuberant comic power and geniality of his great contemporary.

He was not only the oldest native dramatist, but the first author of an epic poem (*Bellum Punicum*)—which, by combining the representation of actual contemporary history with a mythical background, may be said to have created the Roman type of epic poetry. The earlier part of it treated of the mythical adventures of Aeneas, and the later part of the events of the First Punic War in the style of a metrical chronicle. This poem is the first appearance in Roman literature of the belief in the foundation of Rome by Aeneas. The few remaining fragments produce the impression of vivid and rapid narrative, to which the flow of the native Saturnian verse, in contradistinction to the weighty and complex structure of the hexameter, was naturally adapted.

[1]"If it were permitted that immortals should weep for mortals, the divine Camenae would weep for Naevius the poet; for since he hath passed into the treasure-house of death men have forgotten at Rome how to speak in the Latin tongue."

Fragments (dramas) in L. Müller, *Livi Andronici et Cn. Naevi Fabularum Reliquiae* (1885), and (*Bellum Punicum*) in his edition of Ennius (1884); monographs by E. Klussmann (1843); M. J. Berchem (1861); D. de Moor (1877); F. Marx, *Naevius* (Leipzig, 1911); Mommsen, *History of Rome*, bk. iii., ch. 14. On Virgil's indebtedness to Naevius and Ennius, *see* V. Crivellari, *Quae praecipue hausit Vergilius ex Naevio et Ennio* (1889).

NAEVUS, in medicine, a non-malignant tumour composed of newly-formed blood channels. Three varieties, capillary, venous, and arterial, are described, but the walls of the blood channels differ widely in their microscopic appearances from the corresponding normal vessels. The capillary naevus consists of tortuous small channels, often with relatively thick walls; it may be slightly raised above the surface of the skin (and then bleeds readily on slight injury) or flat and purple in colour, when it constitutes the "port-wine stain" or "mother's mark." The venous naevus consists of large irregular channels with very thin walls and is usually found in the subcutaneous tissue or the liver. Capillary and venous naevi are common on the face and may extend in size rapidly. The arterial naevus is rare; it pulsates and the channels may be emptied by pressure. Most naevi are so small as to call for no special treatment; if they take on growth or are initially so large as to cause disfigurement they may be treated by electro-puncture or by application of radium or carbonic-acid snow. The object desired is coagulation of the contained blood and replacement of the tumour by scar tissue. In the case of a large naevus, especially if venous, treatment may take weeks but great cosmetic improvement is usually possible.

NAGA, a municipality (with administrative centre and 11 *barrios* or districts), capital of the province of Camarines Sur, Luzon, Philippine Islands, a short distance south of San Miguel bay, on the Bikol river. Pop. (1939) 22,505; 74 were white. As early as 1573 Juan de Salcedo reached the vicinity and shortly afterward, by order of Gov. Francisco de Sande, the town of Nueva Cáceres was founded on or near the site of the native settlement which had existed there long before. The new town became the capital of Camarines province which, in 1919 was divided into Camarines Norte and Camarines Sur, Naga becoming the latter's capital. It is on the railway from Manila to the southeast and is reached on the river by small steamers from Manila and elsewhere. The surrounding region is fertile, and there are various household industries.

Bikol is the vernacular. Of the inhabitants aged 6 to 19 inclusive, 46·5% in 1939 attended school, while 63·8% of the population 10 years old and over was literate.

NAGA HILLS, a district of British India in the Surma Valley and Hill Districts division of Assam. It forms part of the mountainous borderland lying between the Brahmaputra valley and Upper Burma. Area, 4,289 sq.mi.; pop. (1941) 189,641. The whole country forms a wild expanse of forest, mountain and stream: Japvo (9,890 ft.), south of Kohima, is the highest mountain in Assam. Coal is known to exist in many localities, as well as iron ore and petroleum; a coal mine is worked by the Nazira Coal Company. The administrative headquarters of the district are at Kohima, at which is stationed a battalion of the Assam Rifles. When the British first came into contact with them, the Nagas were blood thirsty savages with a passion for head-hunting. The necessity of protecting British subjects from their ferocious raids led to punitive expeditions and the gradual occupation of the hills. A frontier district was first formed in 1866; the twelfth and last expedition came to a successful issue in 1880, after which it was decided that the Naga Hills should be administered as British territory. In 1904 some territory of the eastern Angamis, the most warlike tribe, was annexed, and during the operations of 1917–19 against the Kukis of Manipur a further tract was occupied, bringing the boundary up to Burma, north of Manipur. Since 1880 the Nagas have given no serious trouble and have been pacified and to some extent civilized. (X.)

The Nagas.—This name is used for a group of tribes inhabiting the northern part of the hills dividing Assam from Burma. Within the group are tribes of mixed origin, varying cultures, and very different physique and appearance, but having enough in common to make it generally possible to say, within the area indicated, whether a given tribe is Naga (as distinct from Kachin, Kuki, Kachari, etc.) or not.

Every sort of political organization is found from the autocracy of tabued chiefs (Konyak tribes) though gerontocracy (Ao tribe) to purest democracy (Angami tribe). Socially patrilineal exogamy is everywhere the rule, but there are indications of the pre-existence of matrilineal and perhaps totemistic systems and of leviritical polyandry. Dual organization (*q.v.*) is found and communal houses for the unmarried. Some tribes (*e.g.*, Sema, Chang) practice polygyny; monogamy is more common, divorce being easy and frequent. Inheritance of land always passes in the male line.

Agriculture is practised by all tribes, some growing rice on elaborately built up and irrigated terraces (Angami, Tangkhul), others growing it dry, and others using millet, *Coix lachryma* or taro as the staple crop, with maize, sorghum, yams and sago as subsidiary. Millet is often grown on dry terraces among pollarded alders; cotton is grown, cattle are kept and numbers of mithun (*bos frontalis*), which has generally but not everywhere displaced the buffalo. Dogs are reared for food (*see* CYNOTHERAPY) as well as hunting. Fishing is practised, particularly with the use of intoxicants which kill or incapacitate the fish. Manufactures and the arts include weaving (on simple tension looms), dyeing, potmaking, blacksmith's work and rough wood-carving. Material culture shows many links with Indonesia and Melanesia, and the northern tribes make huge wooden xylophones, membraneless "drums" often suggestive of dug-out canoes with carved figureheads, which are beaten to raise an alarm or celebrate important events. The prevailing weapon is the throwing-spear, but crossbows are used by some tribes, also guns. Music and dancing are most highly developed in the southern tribes, but are everywhere popular. The languages, which belong to the Tibeto-Burmese family, are diverse and excessively numerous, nearly every village having its own dialect. All dialects are tonal and agglutinative.

See Mills, *The Ao Nagas* (1926, bibl.). (J. H. H.)

NAGASAKI, a town on the south-west of the island of Kyushu, Japan, in 32° 44′ N., 129° 51′ E., with 252,630 (1940) inhabitants. The first port of entry for ships coming from the south or the west to Japan, it lies at the head of a beautiful inlet some 3 mi. long, which forms a splendid anchorage, and is largely used by ships coming to coal and by warships. The most important industries of the town are represented by the engine works of Aka-no-ura, three large docks and a patent slip, the property of the Mitsubishi Company.

Nagasaki is a noted shipbuilding port and coaling station. The coal is obtained chiefly from Takashima, an islet 8 mi. S.E. of the entrance to the harbour, and in lesser quantities from two other islets, Naka-no-shima and Ha-shima, which lie about 1 mi. farther out.

Nagasaki owed its earliest importance to foreign intercourse. Originally called Fukae-no-ura (Fukae Bay), it was included in the fief of Nagasaki Kotaro in the 12th century, and from him it took its name. But it remained an insignificant village until the 16th century, when, becoming the headquarters of Japanese Christianity, and subsequently the sole emporium of foreign trade in the hands of the Dutch and the Chinese, it developed considerable prosperity. The opening of the port of Moji (*q.v.*) deprived Nagasaki of its monopoly as a coaling station and in general diminished its importance in foreign trade, since the industrial portions of Kyushu are nearer to Moji and Shimonoseki.

NAGAUR, a town in India, in Jodhpur state of Rajputana. Pop. (1941) 14,714. Nagaur is surrounded by a wall more than 4 mi. in circuit. It has given its name to a famous breed of cattle.

NAGINA, a town of British India, in Bijnor district of the United Provinces, 48 mi. N.W. of Moradabad. Pop. (1941) 26,077. There is considerable trade in sugar, besides manufactures of guns, glassware (especially bottles for the use of pilgrims carrying the sacred water of the Ganges from Hardwar) and ebony wares.

NAGOYA, the capital of the province of Owari, Japan, on the great trunk railway of Japan, 235 mi. from Tokyo and 94 mi. from Kioto. Pop. (1940) 1,328,084. It is the third of the chief cities in Japan. It lies near the head of the shallow Isenumi bay, about 30 mi. from the port of Yokkaichi, with which it communicates by light-draught steamers and by rail. The castle of Nagoya, erected in 1610, never suffered in war, but in modern times became a military depôt; the interior contains much splendid decoration. The religious buildings of Nagoya include a very fine Buddhist temple, Higashi Hongwanji. Nagoya is one of the great seats of the pottery trade; 13½ mi. distant are the potteries of Seto, where the first glazed pottery made in Japan was produced by Kato Shirozaemon, after a visit to China in 1229.

Nagoya is an important weaving and spinning centre, but in recent years the relative importance of its textiles has declined, and by 1940 it ranked only below Tokyo and Osaka as an industrial centre, manufacturing light and heavy machinery, including aircraft engines.

NAGPUR, a city, district and division of British India in the Central Provinces, of which it is the capital. The old capital of the Bhonsla dynasty has expanded out of all recognition between 1852, when it came under British rule, and the present day. Its population, 84,000 in 1872, had expanded to 301,957 at the census of 1941. From being the terminus of a branch line it has become an important railway centre, nearly half way between Bombay and Calcutta and on the new north and south railway route between Madras and Delhi. It is also connected by a 2 ft. 6 in. gauge railway with Chindwara and Chanda. It is the commercial, as well as the administrative capital of the Province and the centre of education, being the seat of the university and the headquarters of both the Anglican and Roman Catholic dioceses and of important Protestant missions.

The whole area is dominated by the hill and fort of Sitabaldi, overlooking the civil station on the west, the city proper on the east and north, and the suburbs of Sitabaldi and Craddock Town to the south. This hill is the scene of the famous battle of Nov. 1817 where a small British force of less than 1,500 strong repulsed the Mahratta army of 20,000. The only regular troops in Nagpur now are those stationed in this fort, but it is the headquarters of the auxiliary force. Besides the mills, there is an important hand-weaving industry carried on by Koshtis, producing fine fabrics and silk-bordered cloths. There is also a large community of Momins or Mohammedan weavers.

The DISTRICT OF NAGPUR has an area of 3,836 square miles and a population of (1941) 1,059,989 as compared with 630,346 in 1872. It contains in all 12 towns and is situated on an extension of the Berar plain eastwards of the Wardha river. In the western portion Deccan trap overlies sandstone formation. In the eastern portion the sandstone is broken up by granite and the juxtaposition of these formations, which meet at Sitabaldi, makes the geology of the district interesting. In the north and north-east there are valuable deposits of manganese ore which are worked by three large companies and several individual concessionaires. The sacred hill of Ramtek in the north-east, with its gleaming white temples, is a landmark for miles around. The drainage of the east is to the Wainganga in Bhandara, and of the west to the Wunna and Wardha rivers. The plain is broken up in the west by ranges of flat-topped hills, but there are many plains, fertile valleys and pockets of rich land.

Agriculture is varied, Kunbis being the great cultivating Mahratta caste, but Raghvis and Kirars, immigrants from Upper India, are also excellent cultivators. To the west the cropping is mainly cotton and *juar*, in the centre and south wheat, linseed, and pulses are the chief staples. On the north-east and south-east there is a considerable area of rice. There are fine betel leaf plantations and the district is famous for its orange gardens. Government forests cover 500 square miles, mostly concentrated in the reserves along the Pench river on the north, but isolated blocks of not much value are scattered over the rest of the district.

NAGYKANIZSA (nŏd'ĭ-kăn-ĭts'ah), a town of west Hungary, county Zala, a railway junction and agricultural market town. It has large flour-mills, distilleries, breweries and vegetable-preserving works, manufactures bricks and trades in cereals and cattle. It was once a powerful fortress, important during the attacks of the Turks who held it 1600–90. Pop. (1930) 34,217.

NAGYSZOMBAT: *see* TRNAVA.

NAHUATL. The Nahua or Nahuatl language was that spoken in and about Anahuac—the high valley of Mexico. It forms, with Shoshonean and Piman, the Uto-Aztecan speech family. The centre of the Nahuan peoples was on the south-east end of the great central mesa of Mexico, where the Toltecs were the most important prehistoric and the Aztecs the best known historic representatives. Nahuan groups also extended southward into Morelos and Guerrero, eastward along the coast to Colima, and northward again into Jalisco, where they abutted on Piman-Sonoran peoples. Except at this point, the related Piman and Nahuan groups were not in contact, but were separated by the alien Tarasca and Otomi. South-east of Mexico and Puebla, the Atlantic lowlands from Vera Cruz to Tabasco were Nahuan; here were the Olmecs and others, north of the Zapotec and Mixe-Zoque, and bordering in the east on Mayan peoples. The Nahua territory is continuous thus far. Beyond, there were detached areas in Chiapas, Guatemala, El Salvador, Nicaragua, and even Panama. These represented dispersal migrations, some early, some later. Nahuan speech seems to have been fairly uniform, but was further standardized to the dominant Aztec by Spanish influence. It is still the mother tongue of over half a million Mexican Indians, while probably as many more, and many whites, are partially acquainted with it. Through the Toltecs and Aztecs, the Nahuan peoples share with the Maya the distinction of having been the bearers of highest culture in aboriginal America.

NAHUM (Hebrew for "rich in comfort [is God]"), an Old Testament Prophet. Of the Prophet himself, all that is known is the statement of the title that he was an Elkoshite. But the locality denoted by the designation is quite uncertain. The original heading of Nahum's prophecy is contained in the second part of the superscription: "(the book of) the vision of Nahum the Elkoshite." The first part ("Oracle concerning Nineveh") is a late editorial insertion, but correctly describes the main contents of the little book.

Contents.—Chapters i. and ii. The prophecy against Nineveh in its present form really begins with chapter ii. 1, followed immediately by v. 3, and readily falls into three parts, viz. (*a*) ii. 1, 3–10; (*b*) ii. 11–13; and (*c*) iii. Here (*a*) describes the assault on Nineveh. The city is mentioned by name in ii. 8 (9 Heb. text), its capture and sack; (*b*) contains an oracle of Yahweh directed against the king of Assyria; (*c*) again gives a vivid picture of war and desolation which are to overtake and humiliate Nineveh, as they have already overtaken No-Amon (*i.e.*, Egyptian Thebes, vv. 8–10). The absence of distinctly religious motive is remarkable.

Chapter i. forms the exordium of the prophecy of doom against Nineveh. Its tone is exalted, and a fine picture is given of Yahweh appearing in judgment: The effects of the divine anger on the physical universe are forcibly described (vv. 3–6); on the other hand, God cares for those "that put their trust in Him" (v. 7), but overwhelms His enemies (vv. 8–12*a*). In the following verses (12*b*–15) the joyful news is conveyed to Judah of the fall of the oppressor.

Regarding Chapter i. and ii. 2 (=i. and ii. 1, 3, Heb. Text) there has been much discussion in recent years. It was long ago noticed that traces of an alphabetic acrostic survive in this section of the book. In vv. 12*b*, 13 and (certainly) v. 15 (=ii. 1 Heb.) Judah appears to be addressed. The text of i. 1–15, ii. 1–2 has been reconstructed by H. Gunkel and G. Bickell so as to form a complete alphabetic psalm with contents of an eschatological character, and is regarded by them as a later addition to the book. It is generally held by scholars that i. 1–8, 13, 15, and ii. 2 certainly do not proceed from Nahum (i. 9–12 may, however, belong to the prophet). No satisfactory solution has been reached.

Date.—The date of the composition of Nahum's prophecy must lie between 612, when Nineveh was captured and destroyed by the Babylonians and Medes, and the capture of Thebes (No-Amon), which is alluded to in iii. 8–10, in 663 B.C. On the whole a date somewhat near 612 is more probable. The poetry of the book is of a high order.

BIBLIOGRAPHY.—The *Commentaries* on the minor prophets, especially those of J. Wellhausen, D. W. Nowack and K. Marti (all German); G. A. Smith, *The Book of the Twelve Prophets,* 2 vol., rev. ed. (1929); A. B. Davidson (ed.), *Nahum, Habakkuk and Zephaniah* (1896). (G. H. B.)

NAIADS, in Greek mythology the nymphs of wells, mountains and the sea, taking their name from the sphere of nature they represented. (*See* NYMPHS.)

NAIDU, SAROJINI (1879–1949), Indian poetess, orator in languages and nationalist, eldest child of Aghorenath Chattopadhyaya, principal of the Nizam's college, Hyderabad, Deccan, was born in that city on Feb. 13, 1879. She matriculated at the Madras university when only 12, and began soon after to write English verse. Sent to Britain in 1895, she studied at King's college, London, and Girton college, Cambridge. Her volumes of verse were sponsored by such discerning critics as Arthur Symons and Edmund Gosse, and included *The Golden Threshold, The Bird of Time* and *The Broken Wing.* They were translated into the chief Indian vernaculars and European languages, and her verse was frequently set to music. Her marriage to M. G. Naidu, a rajput who became head of the medical service in Hyderabad state, was resented in orthodox Hindu circles on grounds of caste. Mme. Naidu soon deserted the poetic muse to promote social and political reform and the feminist movement—fields which gave scope for fiery oratory and telling wit—and increasingly identified herself with the advanced wing of the Indian National Congress party. At Cawnpore in 1925 she was the first Indian woman to preside at an annual session. She threw herself into Mohandas Gandhi's civil disobedience movement in 1930, and underwent the first of several imprisonments. She accompanied the mahatma to London when he was the sole representative of the Congress party at the second session of the Indian round table conference. Though inclined to realism, she supported the attitude of aloofness from, and then of avowed hindrance of, India's great part in the war effort of the United Nations. Following on the decision in Aug. 1942 to embark on mass civil disobedience, she was arrested with other members of the working committee of the Congress party, being released in March 1943 on grounds of health. In 1947 she became governor of the United Provinces. She died in Lucknow, India, on March 2, 1949. (F. H. BR.; X.)

NAIK or NAYAK, from a Sanskrit word meaning a leader, a title used in India in various senses. In the army it denotes a rank corresponding to that of corporal, and Hyder Ali of Mysore was proud of being called Haidar Naik, analogous to "le petit caporal" for Napoleon.

It was also the title of the petty dynasties that arose in southern India on the downfall of the Hindu empire of Vijayanagar in the 16th century.

NAIL MANUFACTURE. Iron nails were commonly in use during the Roman occupation of Britain, large numbers having been found in places where they were wrought by the Romans. There is a striking similarity between the forged Roman nail (fig. 1) and the type of nail which is manufactured at the present time.

The forging of nails was an industry of some importance in Great Britain up to the end of the 17th century, and gave way only before the advent of machinery and the cut and machine-headed nail.

Wire Nails.—The use of wire for nail making has completely revolutionized the method of manufacture; nails made from drawn wire are produced so cheaply that they can be purchased at almost the same price as the wire from which they are made. Cut nails, sheared from plates or flat stock, are produced, but the quantities in which these nails are used are so small, compared to the production of round wire nails, that cut nails are now negligible items.

Catalogues of prominent nail manufacturers show nearly 100 different types of nails or fasteners made of round wire, but the

number of items, by gauges and sizes, run over 400. Figure 1 shows many common types of wire nails, (*a*) common nail, (*b*) barbed car nail, (*c*) finishing nail, (*d*) clinch nail, (*e*) slating nail, (*f*) countersunk head, (*g*) double-head form nail, (*h*) flooring brad, (*i*) broom nail, (*j*) roofing nail, (*k*) fine nail.

Screw type (*m*) nails have been developed and are used to some extent, principally as roofing nails. This type of nail tends to drive more easily, rotates as it enters the wood and retains greater holding power than does a similar nail of round wire. One method in common use for the manufacture of this type of nail is to produce it as a round wire nail and then pass the nail between two rolls and roll into the shank four or five spiral flutes. Another type of nail, developed to increase holding power, has annular serrations or saw-tooth ridges around the shank that are designed to bite into the grain of the wood when forces tend to withdraw the nail. This particular type of nail is used to some extent for fastening composition type shingles and siding.

Forming wire nails is a typical cold heading operation. Stresses and pressures in various parts of the nail machine are great and nail machines are relatively massive. There are principally four component parts in a nail machine; a hammer mounted in a cross-head to which is imparted reciprocating motion through a connecting-rod and a crankshaft, a set of cam-actuated slides which hold case-hardened tools that form the point and cut the nail after it is headed, another set of cam-actuated slides which hold the dies that grip the round wire and act as an anvil for the hammer forming the head, and a reciprocating feed table which straightens the wire as it unwinds from the coil and feeds through the heading dies the proper amount of wire stock for the nail. In operation, the feed table straightens and forces wire through the header dies in sufficient amount to provide stock for the head, the header

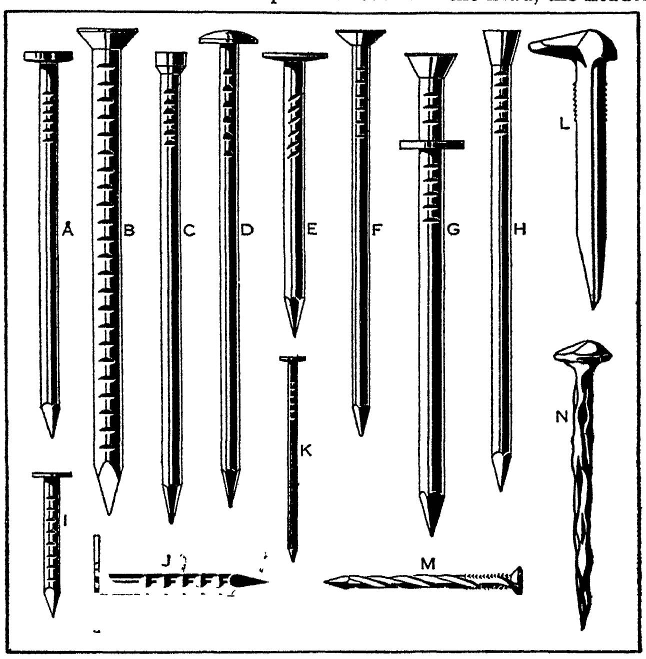

FIG. 1.—VARIOUS KINDS OF NAILS
(A) Common, (B) barbed car, (C) finishing, (D) clinch, (E) slating, (F) countersunk, (G) double-head form, (H) flooring brad, (I) broom, (J) roofing, (K) fine nail, (L) dog spike, (M) screw nail, (N) Roman

dies then grip the wire and the hammer moves forward to form the head. During the forward travel of the hammer, the feed table is retracted, ready to feed material into the machine for the next nail. After the head is formed, the hammer is withdrawn and the feed table moves forward with wire for another nail. After the feed table has completed its forward travel and the header dies have gripped the wire, the cutting and pointing tools move together, form the point and cut off the nail and the cycle is repeated, for each nail, at every revolution of the crankshaft.

Nail machines operate at speeds varying from 150 12″ spikes to over 600 cigar-box nails per minute. After nails are "cut," they are placed in rumblers, with a small amount of sawdust, and rumbled 15 or 20 minutes to remove "whiskers" and be polished and are then dumped into kegs for shipment.

Staples.—As staples are a form of nail, their manufacture is usually carried on with that of nails. They are made both from bright and galvanized wire, and in all kinds of sizes. The three different forms of points on staples are illustrated (fig. 2), the names themselves indicating the difference in the style of point. The term "presser point" simply means that the point is so sharp and fine that the staple can be stuck into the wood by simple pressure previous to being hammered down.

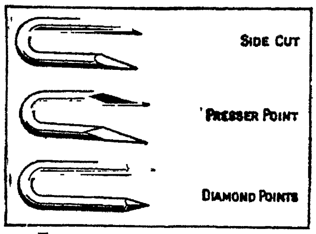

FIG. 2.—FENCING STAPLES
The points are selected according to the kinds of wood used

The several types of machines used in the making of staples follow the same principle as in the making of the straight nail, the wire being automatically fed forward from the swift, and the operation of cutting and pointing being immediately followed by the bending of the wire into its required shape to form the staple.

(R. M. HU.)

NAIL VIOLIN, a musical curiosity invented by Johann Wilde, a musician in the imperial orchestra at St. Petersburg. It consisted of a wooden soundboard about 1½ft. long and 1ft. wide, bent into a semicircle. In this soundboard were fixed a number of iron or brass nails of different lengths, tuned to give a chromatic scale, and the sound was produced by friction with a strong bow, strung with black horsehair.

NAINI TAL, a town and district in the Kumaon division of Uttar Pradesh, republic of India. The town (which is the divisional headquarters) is 6,400 ft. above sea level. Pop. (1951) 12,350. Naini Tal is a popular sanatorium for the residents in the plains. It is situated on a lake, surrounded by high mountains, and is subject to landslides; a serious catastrophe of this kind occurred in Sept. 1880. There are several European schools and a college of Agra university, besides military barracks.

NAINI TAL DISTRICT comprises the lower hills of Kumaon and the adjoining Tarai or submontane strip. Area, 2,632 sq.mi. Pop. (1951) 335,414. The district includes the Gagar and other foothills of the Himalayas, which reach an extreme height of nearly 9,000 ft. The Bhabar tract at their base consists of boulders from the mountains, among which the hill streams are swallowed up. Forests cover vast areas of the hill country and the Bhabar. Beyond this is the Tarai, moist and extremely unhealthy. There the principal crops are rice and wheat. In the hills a small amount of tea is grown, and a considerable quantity of fruit.

NAINSOOK, a light and fine cotton fabric of the plain calico weave, and of texture similar to that of lawn and cambric. It is usually bleached and sometimes striped and checked and finished with a very soft feel for use as lingerie and underwear.

NAIRN, a royal and small burgh and the county town of Nairnshire, Scot., on the Moray Firth, at the mouth of the Nairn, 16 mi. E.N.E. of Inverness by road. Pop. (1951) 4,700. The town attracts many summer visitors by its mild and dry climate, good sea bathing and golf courses. Salmon, herring and white fishing are carried on. There is a good harbour, constructed by Thomas Telford in 1820 and enlarged by the building of a dock in 1932. Nairn (originally Invernairn) was made a royal burgh by Alexander I (d. 1124); but his charter, having been lost, was confirmed by James VI in 1589.

NAIRNE, CAROLINA, BARONESS (1766–1845), Scottish song writer, was born in the "auld hoose" of Gask, Perthshire, on Aug. 16, 1766. She was descended from an old family settled in Perthshire in the 13th century, and could boast of kinship with the royal race of Scotland. Her father, Laurence Oliphant, was one of the foremost supporters of the Jacobite cause, and she was named Carolina in memory of Prince Charles Edward. In 1806 she married W. M. Nairne, who became Baron Nairne in the year 1824. She brought out a collection of national airs set to appropriate words. To this collection, *The Scottish Minstrel* (1821–24), she contributed a large number of original

songs, adopting the signature "B. B."—"Mrs. Bogan of Bogan." The music was edited by R. A. Smith. She died at Gask on Oct. 26, 1845. Among her most famous songs are: "The Laird o' Cockpen," "The Fife Laird," "John Tod," "Charlie is my darling," "Caller Herrin'" and the "Land o' the Leal." For vivacity, genuine pathos and bright wit her songs are surpassed only by those of Burns.

For Lady Nairne's songs, see *Lays from Strathearn, arranged with Symphonies and Accompaniments for the Pianoforte by Finlay Dun* (1846); vol. i of the *Modern Scottish Minstrel* (1857); *Life and Songs of the Baroness Nairne, with a Memoir and Poems of Caroline Oliphant the Younger*, edited by Charles Rogers (1869, new ed. 1886). *See* also T. L. Kington-Oliphant, *Jacobite Lairds of Gask* (1870).

NAIRNSHIRE, a northeastern county of Scotland, bounded west and south by Inverness-shire, east by Elginshire and north by the Moray firth. Land area 104,252 ac. or 162.9 sq.mi. There are 9 mi. of coast. It is the fourth smallest county in Scotland. The seaboard, skirted by sandbanks dangerous to navigation, is lined by low dunes extending into Elginshire. Traces of old marine terraces are seen at elevations of 100, 50 and 25 ft. above present sea level. Parallel with the coast there is a deposit of blown sand and gravel about 90 ft. high stretching inland for 4 or 5 mi. This and the undulating plain behind are a continuation westward of the fertile Laigh of Moray. The lowland rocks are Old Red Sandstone, widely covered with glacial deposits consisting of lower and upper boulder clays, with later gravels forming ridges on the moorland between the rivers Findhorn and Nairn. From this region southward the land rises rapidly to the confines of Inverness-shire, where the chief heights occur. This higher land consists of the eastern, Dalradian, or younger Highland schists, with associated granite masses. Several border hills exceed 2,000 ft. in elevation. The only rivers of importance are the Findhorn and the Nairn, both rising in Inverness-shire. The Findhorn after it leaves that county takes a northeasterly direction down Strathdearn for 17 mi. and enters the sea to the north of Forres in Elginshire after a total course of 72 mi. The Nairn, shortly after issuing from Strathnairn, flows to the northeast for 12 mi. out of its complete course of 38 mi. and falls into the Moray firth at the county town. There are eight lochs, all small: that of Clans contains crannogs, or ancient lake dwellings.

History.—The country was originally peopled by the Gaelic or northern Picts. Stone circles believed to have been raised by them are found at several places, particularly in the valley of the Nairn. To the north of Dulsie Bridge is a monolith called the Princess stone. Mote hills and stones with cup markings are also common. Beyond the occasional finding of Roman coins, there is little evidence of effective Roman occupation. Columba and his successors made valiant efforts to Christianize the Picts, but it was long before their labours began to tell, although the saint's name was preserved late in the 19th century in the annual fair at Auldearn called "St. Colm's Market," while to his biographer Adamnan—corrupted into Evan or Wean—was dedicated the church at Cawdor, where an old Celtic bell also bears this name. By the 10th century the Picts had been subdued with the help of the Norsemen, and Nairn, which was one of the districts colonized by the Scandinavians as part of the ancient province of Moray, soon became an integral portion of the kingdom of Scotland. Hardmuir, between Brodie and Nairn, is the heath where Macbeth is reputed to have met the witches. Territorially Moray was greatly contracted in the reign of David I, and thenceforward the history of Nairn merges in the main in that of the bishopric and earldom of Moray. (*See* ELGIN.) The thane of Cawdor was constable of the king's castle at Nairn, and when the heritable sheriffdom was established toward the close of the 14th century this office was also filled by the thane of the time.

Industries.—The soil of the alluvial plain, or Laigh, is light and porous and careful cultivation has rendered it very fertile, and there is some rich land on the Findhorn. Although advanced methods of agriculture are in use, only a small proportion of the surface is capable of tillage, with oats, turnips and swedes usually predominating. The hills are mostly covered with heath and pasture, suitable for sheep, and cattle are kept on the lower-lying ground. A little sandstone quarrying and the sea and salmon fisheries of the Nairn are the only industries of the shire. The London Midland Region railway from Forres to Inverness crosses the north of the shire.

Population and Government.—The population was 8,719 in 1951. In 1931 Gaelic and English were spoken by 410 persons. Nairn (1951 pop. 4,700), the county town, is the only royal burgh and only small burgh. Nairn and Moray shires combine to return one member to parliament. There are no county districts.

The shire forms a sheriffdom with Moray and a sheriff-substitute from Elgin sits also at Nairn.

NAIROBI, the capital of Kenya colony, British East Africa, 330 mi. by railway from Mombasa; railway headquarters for Kenya and Uganda and the most important urban centre in East Africa. It is built on the Athi plains, at the foot of the Kikuyu hills, and is 5,452 ft. above sea level. It commands magnificent views of Kilimanjaro and Mt. Kenya. Pop. (1948) 54,579 non-natives, of whom 10,830 were Europeans. Nairobi is the seat of the Kenya legislature and the headquarters of most of the European organizations in the colony. Nearly all the whites are British, and the town has most of the amenities of a European city. Both the standard and the cost of living are high. Laid out on a large scale, Nairobi has many fine private and public buildings.

The main thoroughfares are Government road, where numbers of shops and offices are owned by Indians, and Delamere avenue. The churches include an Anglican cathedral, mosques and a synagogue. In Sixth avenue are a cenotaph to the European soldiers who died in World War I and opposite it a striking memorial, three figures on a single base, to the African troops and carriers who died in the war The African memorial was erected in 1928 Parklands, the Hill, Muthiaga, Kilimani and Westlands are residential suburbs for Europeans. The Coryndon Memorial museum, a natural history museum, in Kirk road, was opened in 1922. The McMillan Memorial library was opened in 1931. The Indian bazaar covers nine acres. The natives occupy separate locations on the outskirts at Pumwani Village and Pangani. A memorial hall was erected at Pumwani in memory of the 46,618 natives who gave their lives during World War I. A branch railway runs to the foot of Mt. Kenya, and from Nairobi there is a motor road to the navigable Nile at Nimule or Rejaf. This is part of a motor road from Rhodesia to the Sudan (practicable in dry weather). Nairobi is governed by an elected municipality, with separate franchise rolls for Europeans and Indians. The climate is generally good.

The site of Nairobi was selected as the headquarters of the Uganda railway, and the first buildings were erected in 1899. For some time nearly all its inhabitants were railway officials and Indian coolies engaged in the construction of the line. In 1902 the surrounding highlands were found to be suitable for European settlement and Nairobi speedily grew in importance; in 1907 the headquarters of the administration were transferred to it from Mombasa. Nairobi had then 350 white inhabitants; in 20 years their number increased tenfold. An ambitious town-planning scheme was adopted in 1927.

Nairobi has a good bus system for local transportation, several well-appointed hotels, a number of social clubs, playing fields for cricket, football, soccer and polo and tennis courts and golf links. There are several schools for European children of both sexes. There are local radio broadcasts and daily and weekly newspapers. There is an airport. (R. J. BE.)

NAIVASHA, a lake, town and province, in Kenya colony. The lake, which is roughly circular with a diameter of about 13 mi., lies 6,135 ft. high on the crest of the highest ridge in the eastern rift-valley between the Kikuyu escarpment (east) and the Mau escarpment (west). It is fed by the rivers Gilgal and Morendat, which run in deep gullies, but has no known outlet. The water of the lake is fresh; the shore in many places is lined with papyrus. North and northwest the lake is closed in by the volcanic Buru hills; to the south towers the extinct volcano of Longonot. Hippopotami and otters frequent the lake, and on an island about 1 mi. from the shore are large numbers of antelopes and other game. Naivasha was discovered in 1883 by Gustav Adolf Fischer (1848–86), and visited in the same year by Joseph

Thomson, the Scottish explorer. The railway from Mombasa to Victoria Nyanza skirts the eastern side of the lake, and on the railway close to the lake is built the town of Naivasha, 6,230 ft. above the sea, 395 mi. N. by rail from Mombasa. Naivasha province contains much land suitable for colonization by white men, and large areas have been leased to Europeans. The land is especially suitable for cattle and sheep rearing.

NAJARA, ISRAEL BEN MOSES, Hebrew poet, was born in Damascus and wrote in the latter part of the 16th century (1587–1599). He was inspired by the mystical school, and his poems are marked by their bold, sensuous images, as well as by a depth of feeling unequalled among the Jewish writers of his age. He often adapted his verses to Arabic and Turkish melodies. To tunes which had been associated with light and even ribald themes, Najara wedded words which reveal an intensity of religious emotion which often takes a form indistinguishable from love poetry. Some pietist contemporaries condemned his work for this reason; but this did not prevent many of his poems from attaining wide popularity and from winning their way into the prayer-book.

He published during his lifetime a collection of his poems, *Songs of Israel* (*Zemiroth Israel*), in Safed in 1587; an enlarged edition appeared in Venice (1599–1600). Others of his poems were published at various times, and W. Bacher has described some previously unknown poems of Najara (*Revue des études juives,* no. 116 *et seq.*).

NAJIBABAD, a town of India, in the Bijnor district of Uttar Pradesh. Pop. (1941) 26,898. It was founded in the middle of the 18th century by a Rohilla chief, and still contains several architectural monuments of Rohilla magnificence. There is considerable trade in timber, sugar and grain, and manufactures of metalware, shoes, blankets and cotton cloth.

NAKHICHEVAN, an autonomous republic of Russian Transcaucasia created in 1921, and linked administratively with the Azerbaijan S.S.R., from which it is, however, separated by a strip of Armenian territory. It is bordered on the south and southwest by Iran and on the north and east by the Armenian S.S.R.

Area 2,085 sq.mi. Pop. 117,000 (1933). Though the republic is small, its relief is varied. In the southwest it consists of the valley on the left bank of the Araxes river, which there forms the boundary between Russia and Iran, and along the left bank of which goes the railway loop from Tiflis on the Black sea–Caspian line, which links Armenia and the south of Azerbaijan with Baku, and from which a branch line goes to Tabriz from Dzhulpha in the Nakhichevan republic. The republic thus forms a centre for trade between Russia and Iran. From the valley of the Araxes the Armenian or Transcaucasian plateau rises to a height of about 10,000 ft.

The industries of the region are mainly silk weaving, cotton cleaning and wine production. The numerous small cotton-cleaning enterprises were reorganized after the revolution into two large government factories.

Of the mineral wealth in the republic, salt, lead, sulphur, arsenic, copper, sulphur pyrites and coal, only salt is exploited. Curative arsenical and sulphur springs have been known to the native shepherds for centuries.

The population consists chiefly of Armenians and Azerbaijan Turks, with some Russians in the towns of Nakhichevan (pop. 11,700) and Ordubat (pop. 3,665). The number of schools and teachers has markedly increased, and there are Turkish, Armenian and Russian schools, but many children still receive no education.

Grants from the central government of the U.S.S.R. provided for the building of a school, hospital and electric station in the town of Nakhichevan, and a grant was also made for the repair and rebuilding of the small factories, and the irrigation canals, and the development of cotton, silk and salt production. The region was important at an early date because it lay on the route from Teheran and Tabriz to Caucasia. It was laid waste by the Persians in the 4th century, by the Seljuk Turks in the 11th century and by the Mongols in the 13th century. From that time until 1828, when by the peace of Turkman-chai it passed under Russian rule, it was a khanate vassal to Persia and was frequently devastated during the wars between Persia, Armenia, Turkey and Russia. Its importance for trade and its great fertility helped it to recover after each of these disasters and after the more recent 1917–20 period of disorder and struggle.

NAKHICHEVAN, a Russian town, the administrative centre of the Nakhichevan S.S.R. in 39° 14′ N., 45° 24′ E., on the Kish-chai river and at the terminus of a short line linking it with the railway that runs north of the Araxes river and which is connected with Baku. The town is on a spur of the Karabagh mountains at an altitude of 2,940 ft. Pop. 11,700 (1933), mainly Tatars and Armenians. It has an electric plant, motor-driven flour mills and a leather factory. A little to the southeast of it, a branch railway goes to Tabriz.

An ancient site on the Tiflis to Tabriz and Teheran road, the town had much transit trade, especially in salt, between Persia and the north in prerailway days. Armenian tradition claims Noah as its founder, and a mound of earth as his grave. Ptolemy mentions it as Naxuana.

The Persians sacked the town in the 4th century and it did not revive until the 10th century. Alp Arslan, Sultan of the Seljuk Turks, captured it in 1064 and the Mongols raided it in the 13th century. From this period onward it was a bone of contention between Persians, Armenians and Turks. By the peace of Turkman-chai in 1828 it became Russian. The present houses have for the most part been quarried from ancient ruins. A gateway with a Persian inscription and the 12th-century Tower of the Khans remain.

NAKHICHEVAN-ON-THE-DON, a town of the Russian S.F.S.R. in the North Caucasian area on the right bank of the Don, in 47° 18′ N., 39° 45′ E., 6 mi. N.E. of Rostov-on-Don. Pop. 71,321. It shares in the trading prosperity of the latter town, and has smelting, rope and cloth works. It was founded in 1780 by Armenian immigrants, and their descendants still form a large percentage of the population along the banks of the Don.

NAKSKOV, a seaport of Denmark, in the *amt* (county) of Maribo, on a wide bay of the Laalands belt at the west end of the island of Laaland, 31 mi. W. of Nykjøbing by rail. Pop. (1950) 16,074.

A great dike, extending southeast to Rødby (20 mi.), protects the coast against inundation. Nakskov possesses a fine harbour and shipyards, and one of the largest sugar factories in Europe.

NAMAQUALAND, a region of southwestern Africa, extending along the west coast more than 600 mi. from Damaraland (22° 43′ S.) on the north to 31° S., and stretching inland 80 to 350 mi. It is divided by the lower course of the Orange river into two portions—Little Namaqualand to the south and Great Namaqualand to the north.

Little Namaqualand forms part of Cape Colony (*see* CAPE PROVINCE), and Great Namaqualand is the southern portion of German South-West Africa (*q.v.*). The people of Namaqualand are the purest surviving type of Hottentots, and number about 20,000 to 30,000.

NAMASUDRA, "low Shudra," the largest caste in Eastern Bengal, Pakistan; the older Chandal now divided into several subcastes. *En masse* it ranks low, but its agricultural subcastes stand higher. Numbering 2,172,823 in 1921, it shows no tendency to decline.

NAME. The distinguishing appellation by which a person, place, thing or class of persons or things is known. (O. Eng. *nama;* the word is common to all Indo-European languages.)

(*a*). **Savage and Barbarian.**—To the savage, and in a lessening but still considerable degree, to the barbarian and the civilized man in his earlier stages, the name shares the essence of the personality. Therefore a savage has a personal name which is seldom or never pronounced, he being referred to in common parlance by some nickname or by a term of relationship. Not infrequently, to avoid calling the attention of evil spirits to him a savage child is not named at all, being referred to simply as "the child," or he may be given some derogatory name, as "grub," "filth," to deceive hostile powers. Apart from this, we may often distinguish, firstly a birth-name. This is given by the

parents or by some relation, as a rule, and its choice is governed by various considerations. Thus, he may be named from some trifling incident at the time of birth, or from the state of affairs in the country at the time ("Famine" and "War" are known Basuto names); or he may be given a name signifying "child of such a one" (patronymic or matronymic); or frequently among peoples who believe in reincarnation, he may be named after some dead relative supposed to be reborn in him. Very often, at puberty, or on undergoing some ceremony of initiation, he is given a new name, which may be kept secret. Various ceremonies often attend the giving even of the childhood name.

(*b*). **Civilized.**—Modern surnames include: those derived from a place-name, as Johnston (the *ton* or steading of John); these often occur among noble families, as Dumaresque (*de Mariscis,* "of the marshes"; a plebeian equivalent is Marsh); from an occupation, as Smith, Miller; nicknames, as Longfellow, Campbell ("crooked-lip"); and patronymics, as Dickenson (son of Dicken). The familiar Celtic names of the types Ap Rhys, Bowen (Ap Owain), O'Brian, MacFarlane, are of this kind, the surname proper being of later development among Celts than among Teutonic peoples.

Roman Names.—The earliest Italian and Roman names, consisted of a personal name (*praenomen*), as Marcus, followed by an adjective signifying the clan to which the person belonged (*nomen*), as Caecilius, "of the *gens Caecilia.*" All the *praenomina* had originally a meaning, as Gaius, "joyful" It is stated by the author of the little work *De praenominibus* that boys were never given a *praenomen* till they came of age, girls until they married. The latter statement is certainly wrong, since a woman never officially had a *praenomen* at all; the former is contradicted by most of the available evidence. It is possible, however, that a boy's name was not officially given him until he took the *toga virilis* or garb of manhood. Later, a third name was added, originally a personal name or nickname, as *Pulcher,* "handsome." This was called a *cognomen,* and often became a family name; *i.e.,* one common to all the direct descendants of its original bearer, who formed a section of the clan or *gens.* A man might have any number of these *cognomina,* as Publius Cornelius Scipio Aemilianus Africanus, where Scipio is the *cognomen* of the family into which the bearer had been adopted, Aemilianus an adjective formed from the name of his original clan, the *gens Aemilia*—this was a common, although not invariable, method of indicating adoption—and Africanus an officially bestowed title. (*See* also PLACE-NAMES.)

Law.—The Christian name, *i.e.,* the name given to a person on admission to baptism into the Christian Church, dates back to the early history of the church. In England individuals were for long distinguished by Christian names only, and the surname (*see* below) or family name is still totally ignored by the church. In process of time the use of surnames became universal, the only exceptions in England being the members of the royal family, who sign by their baptismal names only.

A clergyman of the Church of England is compelled to perform the ceremony of baptism when required by a parishioner, and to give whatever name or names the godparents select, but although the rubrics do not expressly say so he can object to any name on religious or moral grounds.

The freedom enjoyed in England and the United States as to the kind of Christian name which may be given to a child is somewhat limited in France and Germany. In France, by a decree of the 11 Germinal, an XI., the only names permitted to be recorded in the civil register as Christian names (*prénoms*) of children were those of saints in the calendar and the names of personages known in ancient history. Even at the present day an official list is issued (revised from time to time) containing a selection of forenames, and no name of a child will be registered unless it occurs in this list. A limitation more or less similar prevails in Germany and other European countries.

As regards the surname, custom has universally decreed that a man shall be known by the name of his father. But in England and in some of the United States this custom is not legally binding; there is no law preventing a man from taking whatever name he has a fancy for, nor are there any particular formalities required to be observed on the occasion of the adoption of a fresh surname. If a person adopts a new name and wishes to have it publicly notified and recognized in official circles, the method of procedure usually adopted is that by royal licence, which is subject to duty. If granted, the royal licence is given under the sign manual and privy seal of the sovereign, countersigned by the home secretary. Where there is a more formal adoption of a surname it is usual, for purposes of publicity and evidence, to advertise the change of name in the newspapers and to execute a deed poll setting out the change, and enrol the same in the central office of the supreme court. In the U.S. statutes in many states prescribe an application to a court of record as the method by which a person may change his name. A record of the change is thus certain to be made, but these statutes do not commonly deny an individual his common law right to change his name without resort to the courts.

Both in France and Germany official authorization must be obtained for any change of name. By the German code 1900 (s. 12) if the right to a new name is disputed by another or his interest is injured thereby, the person entitled can compel the abandonment of the new name.

In England and the United States, a wife on marriage adopts the surname of her husband, disregarding entirely her maiden surname; in Scotland the practice usually is for the wife to retain her maiden surname for all legal purposes, adding the name of her husband as an alias. On remarriage the rule is for the wife to adopt the name of the new husband, but an exception to this is made in the case of a title acquired by marriage when the holder remarries a commoner. See in *Cowley* v. *Cowley,* 1901, A.C. 450.

In Spain and in its colonies a man takes the surname of his father, followed by the maiden surname of his mother, joined by "and" (*y*), but this conjunction is often omitted in some colonies.

Peers of Great Britain when signing their names use only their surnames or peerage designations. It is merely a privileged custom, which does not go back further than the Stuart period. Peeresses sign by their Christian names or initials followed by their peerage designation. Bishops sign by their initials followed by the name of the see. In Scotland it is very usual for landowners to affix to their names the designation of their lands, and this was expressly sanctioned by an act of 1672.

See *Ency. Eng. Law,* titles "Christian Name," "Surname"; W. P. W. Phillimore, *Law and Practice of Change of Name* (1905); A. C. Fox-Davies and P. W. P. Carlyon Britton, *Law Concerning Names and Changes of Name* (1906).

NAMPA, largest city of Canyon county, Idaho, U.S.A., in the southwestern part of the state, at an altitude of 2,492 ft., near the Snake river and 20 mi. W. of Boise. It is the junction point of the old Oregon trail (now federal highway 30) and federal highway 95 connecting southwestern Idaho with California points by the most direct possible route. Pop. (1950) 16,142; (1940) 12,149 by federal census. Nampa is in the heart of an extensive and highly productive irrigated section, which in 1949, a typical year, shipped 73,834 carloads of agricultural products. Dairying is the most lucrative agricultural pursuit. Nampa is a subdivision point of the Union Pacific railroad, with passenger service running in six directions out of the city. The railroad also maintains a roundhouse. The Pacific Fruit Express, a Union Pacific subsidiary, employs 600 to 700 men annually in Nampa for repair and manufacture of refrigerator cars. An ice plant and icing platform can ice 110 cars in a few minutes. Other industrial plants are a condensary, creameries, chick hatcheries, meat- and produce-packing plants, grain elevators, flour mills, mattress factories, woodworking plant, a broom factory, bottling works and a butane gas plant. The ghost mining towns of Silver City and DeLamar are reached through Nampa.

NAMUR, one of the nine provinces of Belgium, between Hainaut on one side and Liége and Luxembourg on the other, extends from Brabant up the Meuse to the French frontier. Area, 1,413 sq.mi.; pop. (1947) 356,090 or 252 per sq.mi. It is fertile north of the Meuse and forested in the south. There are a few iron and coal mines between the Sambre and Meuse, and the quarries are

important. Arboriculture, especially fruit-tree plantation, is increasing. There are three administrative arrondissements, Namur, Dinant and Philippeville, 14 cantons and 366 communes.

NAMUR (Flemish, *Namen*), a town of Belgium, capital of the province of Namur. Pop. (1947 census) 31,444. The town lies on the left bank at the junction of the rivers Sambre and Meuse, while the rocky promontory forming the fork between them is crowned with the old citadel, which occupies the site of the old castle of the counts of Namur. This citadel was abandoned for military purposes, and its hill was converted into a park, while the crest was occupied by a hotel reached by a cogwheel railway. Namur is connected with the citadel by two bridges across the Sambre, and from the east side of the promontory there is a fine stone bridge to the suburb of Jambes. This bridge was constructed in the 11th century and rebuilt in the reign of Charles V. It is the only old bridge in existence over the Belgian Meuse. The cathedral of St. Aubain or Albin was built in the middle of the 18th century. The church of St. Loup is a century older, and is noticeable for its columns of red marble from the quarry at St. Rémy near Rochefort. There is a considerable local industry in cutlery, and there are tanneries and glassmaking factories.

In the feudal period Namur formed a marquisate in the Courtenay family. Jousts on stilts were a mediaeval custom that lasted into recent times there. Don John of Austria made Namur his headquarters in the Netherlands, and died here in 1578. Louis XIV took it in 1692 and Vauban renewed the defences but William III retook it in 1695, though the French held it again from 1702–12. In 1893, under the new scheme of Belgian defense, the citadel and its detached works were abandoned, and in their place nine outlying forts were constructed at a distance of from 3 to 5 mi. Namur was the scene of intense fighting in both World Wars I and II.

NANAIMO, a city of British Columbia, on the east coast of Vancouver island, 40 mi. W. of Vancouver and 65 mi. N. of Victoria. The population in 1951 was 7,196. It is connected with Victoria by the Esquimalt and Nanaimo railway, and has a twice daily steamer service to Vancouver. It is in a fruit-farming, dairying and poultry-raising district, and has a good harbour, carrying on trade in coal from the neighbouring mines, and in cured herrings, sent to the east. The industries include sawmills and woodworking shops, breweries, canneries, foundries, brickworks, etc.

NANA SAHIB, the common designation of Dandu Panth, an adopted son of the former peshwa of the Marathas, Baji Rao, who took a leading part in the great Indian mutiny (*q.v.*) and was proclaimed peshwa by the mutineers. Nana Sahib had a grievance against the British government because it refused to continue to him the pension of 800,000 rupees (£80,000), which was promised to Baji Rao by Sir John Malcolm on his surrender in 1818. This pension, however, was intended only to be a life grant to Baji Rao himself. For this refusal the Nana bore the British a lifelong grudge, which he satisfied in the massacres at Cawnpore (*q.v.*). In 1859, when the last rebels disappeared into Nepal, he was among the fugitives. His death was reported some time afterward, but his real fate is obscure.

See G. O. Trevelyan, *Cawnpore* (London and Cambridge, 1865).

NANCHANG, the capital of the province of Kiangsi, China, on the Kankiang, and connected by railway with Kiukiang and with the east-west railway from Chuchow to Hangchow. Nanchang was a centre of commerce for the provincial agricultural products, such as tea, rice, cotton, tobacco, hemp, etc., and had some manufactures. The Japanese occupied Nanchang from 1939 to 1945. The population was given as 266,651 in 1948.

NANCY, a town of northeastern France, the capital formerly of the province of Lorraine, and now of the department of Meurthe-et-Moselle, 219 mi. E. of Paris on the railway to Strasbourg. Pop. (1946) 113,477.

At the close of the 11th century Odelric of Nancy, brother of Gérard of Alsace, possessed at Nancy a castle which enabled him to defy the united assaults of the bishops of Metz and Trèves and the count of Bar. In the 12th century the town was surrounded with walls, and became the capital of the dukes of Lorraine; and in 1477 Charles the Bold was defeated here by René II. (*See* SWITZERLAND: *History.*) Refortified by Charles III. it was taken by the French in 1633. After the peace of Ryswick in 1697 it was restored to Duke Leopold. He founded academies, established manufactures and set about the construction of the new town. But it was reserved for Stanislas Leczinski, the last of the dukes of Lorraine, to make Nancy one of the palatial cities of Europe. The city, which became French in 1766, was occupied by the allies in 1814 and 1815 and put to ransom by the Prussians in 1870. After the Franco-German War the population was greatly increased by the immigration of Alsatians and of people from Metz and its district.

Although Nancy remained outside the area of actual fighting during World War I it was bombarded by German aeroplanes and long-range guns, but the damage was not very serious.

Nancy stands on the left bank of the Meurthe 6 mi. above its junction with the Moselle and on the Marne-Rhine canal. The railway from Paris to Strasbourg skirts the city on the southwest side; other railways—to Metz, to Épinal by Mirecourt, to Château Salins—join the main line near Nancy and make it an important junction. The town consists of two portions—the *Ville-Vieille* in the northwest, with narrow and winding streets, and the *Ville-Neuve* (16th–18th centuries) in the southeast, with wide straight streets. Between the two lies the Place Stanislas, and on all sides rise imposing buildings of the 18th century—the town hall, episcopal palace, etc. A fine triumphal arch erected by Stanislas in honour of Louis XV leads from the Place Stanislas to the Place Carrière, which forms a beautiful tree-planted promenade, containing at its further end the government palace (1760) now the residence of the general commanding the XX army corps, and adjoins the so-called Pépinière (nursery) established by Stanislas.

The cathedral in the Ville-Neuve, built in the 18th century, has a wide façade flanked by two dome-surmounted towers. Of particular interest is the church of the Cordeliers, in the old town, built by René II. about 1482 to commemorate his victory over Charles the Bold. Pillaged during the Revolution period, but restored to religious uses in 1825, it contains the tombs of the counts of Vaudémont. Here also is a chapel built at the beginning of the 17th century to receive the tombs of the princes of the house of Lorraine. The church of St. Epvre, rebuilt between 1864 and 1874 on the site of an old church of the 13th, 14th and 15th centuries, has a fine spire and belfry and good stained glass windows. Of the old ducal palace, begun in the 15th century by Duke Raoul and completed by René II., there remains but a single wing, partly rebuilt after a fire in 1871. The entrance to this wing, which contains the archaeological museum of Lorraine, is Gothic of the early 16th century. One of the greatest treasures of the collection is the tapestry found in the tent of Charles the Bold after the battle of Nancy. Of the old gates of Nancy the most ancient and remarkable is the Porte de la Craffe (1463). The town hall contains a museum of painting and sculpture.

Nancy is the seat of a bishop, a prefect, a court of appeal and a court of assizes, headquarters of the XX. army corps, and centre of an *académie* (educational division) with a university comprising faculties of law, medicine, science and letters, and a higher school of pharmacy. There are also tribunals of first instance and of commerce, a board of trade-arbitrators, and a national school of forestry. The industries of Nancy include printing, brewing, cotton- and wool-spinning and the weaving of cotton and woollen goods, and the manufacture of tobacco (by the State), of boots and shoes, straw hats, pottery, casks, embroidery, machinery, motor cars and spare parts, engineering material, farm implements and iron goods.

NANDI, an East African tribe of mixed Nilotic, Bantu and Hamitic origin. With them are more or less closely allied the Lumbwa (correctly Kipsikīs), Buret (or Puret) and Sotik (Soot) tribes, as well as the Elgonyi (properly Kony) of Mount Elgon. They have also affinities with the Masai. The Nandi-Lumbwa peoples inhabit the country stretching south from Mount Elgon to about 1° S. and bounded east by the escarpment of the eastern rift-valley and west by the territory of the tribes, such as the

Kavirondo, dwelling round the Victoria Nyanza. They have given their name to the Nandi plateau. They have a double administrative system, the chief medicine man or *Orkoiyot* being supreme chief and regulating war affairs, while representatives of the people, called *Kiruogik,* manage the ordinary affairs of the tribe.

The medicine men are of Masai origin and the office is hereditary. The young men form a separate warrior class to whom is entrusted the care of the country. A period of about 7½ years is spent in this class, and the ceremony of handing over the country from one "age" to the succeeding "age" is of great importance. (*See* AGE GRADES.) The arms of the warriors are a stabbing spear, shield, sword and club. Many also possess rifles. All the Nandi are divided into clans, each having its sacred animal or totem. They have no towns, each family living on the land it cultivates. The huts are of circular pattern. The Nandi believe in a supreme deity—Asis—who takes a benevolent interest in their welfare, and to whom prayers are addressed daily. Their language is Nilotic. The primitive hunting tribe known as the Wandorobo speak a dialect closely resembling Nandi.

LUMBWA WARRIOR EQUIPPED TO SPEAR LIONS

See A. C. Hollis, *The Nandi: Their Language and Folk-lore,* with introduction by Sir Charles Eliot (1909), and the works there cited.

NANDU, the Brazilian name for the rhea (*q.v.*).

NANKANA, a people resembling the Bura and the Mampursi, living in the Navoro district of the Northern Territories, Gold Coast, and across the Upper Volta border in the Leo district. They speak a Mossi dialect.

See Cardinal, *The Natives of the Gold Coast.*

NANKEEN, a cotton cloth originally made in China, and now imitated in various countries. The name is derived from Nanking, the city in which the cloth is said to have been originally manufactured. The characteristic yellowish colour of nankeen is attributed to the peculiar colour of the cotton from which it was originally made.

NANKING ("the southern capital"), the name by which Kiang-ning, the chief city in the province of Kiangsu, China, has been known for several centuries. Pop. (1935) 1,019,148. The city is nearly equidistant between Canton and Peking, on the south bank of the Yangtze Kiang 235 mi. from the sea. It dates only from the beginning of the Ming dynasty (1368), although it is built on the site of a city which for more than two thousand years figured under various names in the history of the empire. The more ancient city was originally known as Kin-ling; under the Han dynasty (206 B.C. to A.D. 25) its name was converted into Tan-yang; by the T'ang emperors (A.D. 618–907) it was styled Kiang-nan and Shêng Chow; by the first sovereign of the Ming dynasty (A.D. 1368–1644) it was created the "southern capital" (Nan-king), and was given the distinctive name of Ying-t'ien; and with the accession to power of the Manchu rulers it was officially known as Kiang-ning, though still popularly called Nan-king. It was the seat of the imperial court only during the reigns of the first two emperors of the Ming dynasty, and was deserted for Shun-t'ien (Peking) by Yung-lo, the third sovereign of that line, who in 1403 captured the town and usurped the crown of his nephew, the reigning emperor. The area is 180 sq.mi.

The T'aip'ing rebels, who carried the town by assault in 1853, swept away all the national monuments and most of the public buildings it contained, and destroyed the greater part of the magnificent wall which surrounded it. The wall, of which only small portions remain, was about 70 ft. in height, measured 30 ft. in thickness at the base, and was probably 20 miles in circumference and pierced by thirteen gates. Encircling the north, east and south sides of the city proper was a second wall which enclosed about double the space of the inner enclosure. In the north-east corner of the town stood the imperial palace reared by Hung-wu, the imperial founder of the modern city. After suffering mutilation at the overthrow of the Ming dynasty, this building was burnt to the ground on the recapture of the city from the T'aip'ing rebels in 1864. The most conspicuous public building at Nanking was the famous porcelain tower, which was designed by the emperor Yung-lo (1403–1428) on a previously sacred site to commemorate the virtues of his mother. The building was begun in 1413. In shape the pagoda was an octagon, and was about 260 ft. in height. The outer walls were cased with bricks of the finest white porcelain, and each of the nine stories into which the building was divided was marked by overhanging eaves composed of green glazed tiles of the same material. Hung on chains which stretched from this apex to the eaves of the roof were five large pearls of good augury for the city's safety from flood, fire, storm and civil disturbance.

Nanking was formerly one of the chief literary centres of the empire. It was taken by the British in 1842 and made a treaty port by the French treaty of 1858, but was not formally opened. Its proximity to Chinkiang, where trade had established itself while Nanking was still in the hands of the rebels, made its opening of little advantage. In 1899 it was voluntarily thrown open to foreign trade by the Chinese government, and in 1909 it was connected by railway with Shanghai, and became the southern terminus of the Tientsin-Pukow railway.

The new nationalist government moved the capital of China to Nanking in 1928 and Nanking remained the legal capital when the government moved to the wartime capital of Chungking after the Japanese invasion. After 1928 Nanking developed rapidly and a number of new buildings such as a modern railway station and several ministries were built by the government and broad boulevards were constructed. Modern airfields and shipping facilities increased the importance of Nanking as a communication centre. Outside the city the famous Sun Yat-sen mausoleum was erected in memory of the founder of the Chinese republic. In Nov. 1937 Nanking fell to the Japanese troops. The "rape of Nanking" which followed was fully authenticated by many neutral witnesses. From 1940 to 1945 Nanking was the seat of the puppet government of Wang Ching-wei. Following the defeat of Japan, the government officially returned to Nanking, May 6, 1946, after an absence of eight years.

NANNING, former treaty port in the province of Kwangsi, south China (22° 48′ N., and 108° 15′ E.), and onetime capital of the province, is situated about 30 mi. below the junction of the two branches (Tso-kiang and Yu-kiang) of the south (main) stream of the West river, and about 470 mi. above Canton. Nanning was voluntarily opened to foreign trade by China in 1907 to offset French influence at Lungchow, a treaty port near the Tongking frontier. It is the highest accessible point for steamers on the West river, but the river between Wuchow and Nanning during winter suffers from lack of water so that trade is seriously affected. Numerous small competitive river vessels run between Wuchow and Nanning.

Nanning's economic orientation is toward the Canton delta by the natural route of the Si-kiang, rather than toward the nearer Red river delta of Tongking. The construction, however, of the projected railway from Canton, via Nanning, to connect with the Tongking railway system at Langson (the present terminus) may have the effect of diverting some of the trade of Nanning into Tongking; or again, the construction of a railway may draw much of it to Pakhoi on the Gulf of Tongking, the nearest outlet by sea to Nanning. The value of the whole trade which was 6,623,437 Hk Taels in 1924, had suffered as a result of the Hongkong boycott of 1926. In 1936 it was $70,780 (U.S.), but rose to over $160,000 (U.S.) in 1938 and 1939.

The chief imports of Nanning, to be distributed in W. Kwangsi, and adjacent Yunnan and Tongking, were cotton piece goods, kerosene, clothing, matches and straw mats, while exports comprised chiefly aniseed, beans, hides, groundnut cake, medicines and antimony (the export of which increased greatly). In 1940 Nanning was temporarily occupied by the Japanese and its trade suffered after that. Two main channels served this trade—the Yu-kiang which is navigable for large junks during the summer

flood season as far as Pose-ting (whence a road leads up to the high plateau of Yünnan), and the Tso-kiang which is navigable for large junks and small launches as far as the treaty port of Lungchow, close to the Tongking border.

The population of Nanning was 80,283 in 1939.

NANNY-BERRY (*Viburnum Lentago*), a handsome North American shrub or small tree of the honeysuckle family (Caprifoliaceae), called also black haw, sheep-berry, wild raisin and sweet viburnum, sometimes planted for ornament. It is native to rich soil from Quebec to Hudson bay and southward to New Jersey, Georgia and Colorado. The nanny-berry, though usually a shrub, sometimes grows 30 ft. high, with a trunk diameter of 10 inches. It has slender branches, ovate, long-pointed, finely-toothed leaves and bears small white flowers borne in showy clusters, 2 to 5 in. broad. The oval, bluish-black, sweet, edible fruit ripens in late autumn.

NANSEN, FRIDTJOF (1861–1930), Norwegian scientist, explorer and statesman, was born at Fröen near Christiania, where he spent his childhood, on Oct. 10, 1861. In his fifteenth year his parents removed to Christiania, where he went to school. He entered Christiania university in 1880 and studied zoology; in March 1882 he joined the sealing-ship "Viking" for a voyage to Greenland waters. On his return he became curator of the Bergen Museum, under Daniel Cornelius Danielssen (1815–1894). In 1886 he spent a short time at the zoological station at Naples, during which he wrote papers and memoirs on zoological and histological subjects, for one of which, "The Structure and Combination of the Histological Elements of the Central Nervous System" (Bergen, 1887), the Christiania university conferred upon him the degree of doctor of philosophy. But his voyage in the "Viking" had indicated Greenland as a possible field for exploration, and in 1887 he began preparations for a crossing of the great ice field which covers the interior of that country. Nansen took with him Otto Sverdrup (1855–1930), Captain O. C. Dietrichson, K. K. Trana and two Lapps. The expedition started in May 1888, proceeded from Leith to Iceland, and there joined a sealing-ship bound for the east coast of Greenland. On Aug. 16 began the ascent of the inland ice amid storms, intense cold, and other hardships, they reached the highest point of the journey (8,920 ft.) on Sept. 5, and on the 28th struck the west coast at Ameralik Fjord. They were obliged to winter at the settlement of Godthaab, and Nansen used the opportunity to study the Eskimos and gather material for his book *Eskimo Life* (English translation, London, 1893). The party returned home in May 1889. A report of the scientific results was published in *Petermanns Mitteilungen* (Gotha, 1892). On his return from Greenland Nansen became curator of the Zootomic Museum of Christiania university. In Sept. 1889 he married Eva, daughter of Professor Michael Sars of Christiania university, and a noted singer (d. 1907).

In 1890 he propounded his scheme for a polar expedition before the Norwegian Geographical Society, and in 1892 he laid it before the Royal Geographical Society in London. (*See* "How can the North Polar Region be crossed?" *Geogr. Journal,* vol. i.) His adversely criticized plan succeeded. The Norwegian parliament granted two-thirds of the expenses, and the rest was obtained by subscription from King Oscar and private individuals. His ship, the "Fram" (*i.e.,* "Forward"), was specially built of immense strength and peculiar form, being pointed at bow and stern and having sloping sides, so that the colliding ice-floes would tend, not to crush, but merely to slip beneath and lift her. She sailed from Christiania on June 24, 1893. Otto Sverdrup was master; Sigurd Hansen, a Norwegian naval lieutenant, was in charge of the astronomical and meteorological observations; Henrik Blessing was doctor and botanist. On Sept. 22 the "Fram" was made fast to a floe in 78° 50′ N., 133° 37′ E.; she was frozen in, and the long drift began. She bore the pressure of the ice perfectly. On March 14, 1895, Nansen, being satisfied that the "Fram" would continue to drift safely, left her in 84° N., 101° 55′ E., and started northward on foot with Johansen. On April 8 they turned back from 86° 14′ N., the highest latitude then reached by man; and they shaped their course for Franz Josef Land. They suffered from shortage of food, and were compelled to winter on Frederick Jackson Island (so named by Nansen) in Franz Josef Land from Aug. 26, 1895, to May 19, 1896. They were uncertain as to the locality, but, after having reached 80° N. on the south coast of the islands, they were travelling westward to reach Spitsbergen, when, on June 17, they fell in with Frederick Jackson and his party of the Jackson-Harmsworth expedition, and returned to Norway in his ship, the "Windward," reaching Vardö on Aug. 13. A week later the "Fram" also reached Norway safely, having drifted north to 85° 57′, and returned by the west coast of Spitsbergen. A great welcome awaited Nansen. In England he gave the narrative of his journey at a great meeting in the Albert Hall, London (Feb. 8, 1897), and elsewhere.

In 1896 a professorship of zoology was established for him at the Christiania university; he worked up the results of his expedition and made scientific research in physical geography and oceanography. In the summer of 1900 he took part in an Arctic oceanographic expedition in the S.S. "Michael Sars," headed by Dr. Johan Hjort, and became director of the International Central Laboratory in Christiania for the Research of the Sea. In 1902 he published *The Oceanography of the North Polar Basin,* and in 1904 *The Bathymetrical Features of the North Polar Seas.* In 1905 Nansen took up politics, issuing a manifesto and many articles in connection with the crisis between Norway and Sweden. His attitude may be summarized by the last words of a short work published later in the year: "Any union in which the one people is restrained in exercising its freedom is and will remain a danger" (*Norway and the Union with Sweden,* London, 1905). On the establishment of the Norwegian monarchy Nansen was appointed minister to England (1906), and in the same year was created G.C.V.O. In 1908 he retired from his post and returned to his scientific work as professor of oceanography at Christiania university. In co-operation with Professor Bjorn Helland-Hansen, of the Bergen Museum, he wrote *The Norwegian Sea, its Physical Oceanography* (*Report* on Norwegian Fishery and Marine Investigations, vol. 2, 1909).

In 1910 Nansen made an oceanographic cruise in the "Frithjof" through the northeastern North Atlantic from Ireland to Iceland and back to Norway, and in 1911 published *In Northern Mists* (2 vol.) on the exploration of the northern regions from early times up to the beginning of the 16th century. In 1912 he made a further oceanographic cruise to Spitsbergen and the waters to the north in his yacht the "Veslemoy," and in 1913 he made an expedition through the Arctic and the Kama Seas to the mouth of the Yenisei river and through Siberia and the Amur region.

In 1914, jointly with Helland-Hansen, Nansen made an oceanographic expedition in the eastern North Atlantic to Portugal, Madeira and the Azores and back to Norway. During the World War oceanographic expeditions were impossible. In 1917 Nansen became head of a Norwegian Govt. commission to the United States, and secured a satisfactory agreement with the American Govt. in regard to the import into Norway of essential supplies. After the Armistice (1918) Nansen, as Commissioner of the League of Nations with the executive assistance of the national Red Crosses, was responsible for the repatriation of about 500,000 prisoners of war from Siberia, China and other parts of the world. This work was financed largely by the governments participating in the International Committee for Relief Credits, Paris, of which Lord Bradbury was chairman.

In 1919 Nansen conferred with Hoover on the possibilities of assisting the Russian people, and suggested an organization on the lines of the Belgian Relief Commission. The Supreme Council supported the proposal on the condition that all hostilities in Russia cease. As this was at the time when Kolchak and Denikin were advancing towards Moscow the project was abandoned. In 1921 Nansen was asked by an international conference in Geneva of delegates of 48 Red Cross societies and 12 governments to direct relief work for famine-stricken Russia, and on Aug. 27 he signed an agreement in Moscow with Chicherin, the Soviet Foreign Minister, regarding the method of furnishing relief on a large scale, and visited the famine areas. In Sept. Nansen failed to induce the League of Nations to assist the starving

millions in Russia by raising, under safeguards, an international governmental relief loan. He next visited the chief capitals of Europe, and as a result the European Red Cross societies fed and clothed at the peak of the Russian famine over 1,600,000 inhabitants of the Volga and South Ukraine regions. His publicity campaign had great influence in America, which under Hoover's direction fed at one time 10,000,000 Russian sufferers. Nansen's mission in Russia continued to conduct two agricultural demonstration estates in the former famine areas. In 1923 Nansen published *Russia and the Peace,* setting out the economic position of soviet Russia. As high commissioner for refugees to the League, he was responsible for the protection and settlement of Russian, Armenian and Greek refugees.

In 1923 Nansen was awarded the Nobel peace prize, which he gave to the furtherance of the Nansen agricultural demonstration estates and model farms in Saratov and Ekaterinoslav governments, Russia. In his early manhood Nansen was a great athlete and the popularity of skiing in the Alps is largely due to him; and evidence of his enthusiasm for sport is his work on *Sport in the Polar Regions* and *Wild Norway* (1925). Nansen, as delegate for Norway to the League of Nations, made an impassioned intervention protesting against the occupation of Corfu by Italy in 1923, and at the Fifth Assembly in 1924 he conducted the first informal negotiations for the entry of Germany into the League of Nations. Nansen's interest in education was evidenced by his campaign in favour of Russian professors and universities. In 1925 he was elected lord rector of St. Andrews, and in 1928 published *Armenia and the Near East.* (*See* ARCTIC REGIONS; REFUGEES AND THE EXCHANGE OF POPULATIONS). He died of heart failure at Oslo, on May 13, 1930.

Besides works mentioned above, Nansen described his travels in *The First Crossing of Greenland* (Eng. trans., 1893); *Farthest North* (Eng. trans., 1897); *The Waters of the Northeastern North Atlantic* (*Internationale Revue der gesammten Hydrobiologie und Hydrogeographie,* Leipzig, 1913); *En ferd til Spitzbergen* (1912); *Through Siberia, the Land of the Future* (London, 1914) The scientific results of the various expeditions are given in the following works—the 1888 expedition, in *Petermanns Mitteilungen* (Gotha, 1892); the 1893 expedition, in *The Norwegian North Polar Expedition, 1893–96: Scientific Results* (London, etc., 1900 *sqq*); the 1912 expedition, in *Spitzbergen Waters* (Society of Science, Oslo, 1915); of the 1914 expedition jointly with Helland-Hansen, in *The Eastern North Atlantic* (Geophysic Publication, Academy of Science, Oslo).

NANSEN INTERNATIONAL OFFICE FOR REFUGEES. The Office International Nansen pour les Réfugiés was founded in 1931 as an autonomous body under the League of Nations to carry on the work started in 1921 by Fridtjof Nansen (*q.v.*). At the end of World War I there were more than 2,000,000 refugees in Europe and Asia Minor. Of these, approximately 1,250,000 were political refugees from Russia, several hundred thousand were Armenians expelled from Asia Minor and another substantial number was composed of Greeks who fled into Greece as a result of political circumstances in Asia Minor and the Balkans, where their ancestors had been living for several centuries. The remainder were Assyrians, Assyrian Chaldeans, Bulgars and Turks.

The League of Nations accepted responsibility for the legal protection of these refugees, and in 1921 Nansen, well-known polar explorer, became the first League of Nations high commissioner for refugees. Nansen's work resulted in the development of the international identity certificate known as the "Nansen passport" and he did much of the pioneer work in civil rights and employment and social security rights for refugees.

In 1935 the League brought under the protection of the office the 7,000 refugees who left the Saar as a result of the 1935 plebiscite. Administrative funds were voted by the assembly of the League on a diminishing scale until Dec. 31, 1938, the date set for final liquidation of the office. The League had always considered its interest in refugees to be of a temporary nature and, although it accepted responsibility for their legal protection, it wished to avoid responsibility for their relief.

Nansen's objective had been to make refugees self-supporting. However, the depression of the 1930s made the task of finding employment opportunities for refugees unusually difficult. National governments also wished to avoid relief grants to refugees unable to work, and the depression reduced the funds of private charitable organizations.

Despite these handicaps the Nansen office carried forward its work. In order that the legal protection of refugees might be assured after the closing of the office, the League provided, through the medium of the convention of Oct. 28, 1933, for the issuance of Nansen identity certificates by the governments signing the convention and for rights of residence, employment, social security and relief for Russians, Armenians and assimilated refugees then under the protection of the Nansen office.

Unfortunately this 1933 convention was ratified by only eight states and in some cases with important reservations. It served as a model, however, in drawing up the 1938 convention concerning the status of refugees coming from Germany, and became important after World War II when once again the world was faced with the problem of stateless persons.

The 1938 Nobel peace prize was awarded to the Nansen office. At the close of the office in Dec. 1938, M. Michael Hansson of Norway, president of the Nansen office, reported 600,000 refugees of the foregoing groups still unsettled and without secure civil status. Their situation was worsened as they became part of the larger numbers of refugees displaced by World War II. (*See* also REFUGEES AND THE EXCHANGE OF POPULATIONS.)

NANTERRE, a suburb 8 mi. northwest of Notre Dame de Paris, with a port on the Seine, in the department of Seine, at the foot of Mount Valérien, 8 mi. N.W. of Paris on the railway to St. Germain. Pop. (1946) 41,860. The principal manufactures are chemicals, tallow and aluminum; stone is quarried in the vicinity; the town is noted also for its cakes. Nanterre (the ancient *Nemptodurum* or *Nemetodurum*) owes its origin to the shrine of Ste. Geneviève (420–512), the patron saint of Paris.

NANTES, a city of western France, capital of the department of Loire-Inférieure, on the Loire, 35 mi. above its mouth, at the junction of the Orléans, Ouest-état and State railways, 55 mi. W.S.W. of Angers by rail. In population (1946, 200,265), Nantes is the first city of Brittany. The Loire there divides into several west branches forming islands over portions of which the city has spread.

History.—Before the Roman occupation Nantes was the chief town of the Namnetes and consisted of *Condovicnum,* lying on the hills away from the river, and of *Portus Namnetum,* on the river. Under the Romans it became a great commercial and administrative centre, though its two parts did not coalesce till the 3rd or 4th century. In the middle of the 3rd century Christianity was introduced by St. Clair. Clotaire I got possession of the city in 560, and placed it under the government of St. Félix, the bishop who caused the Loire to flow under the walls of the castle. After being several times subdued by Charlemagne, Brittany revolted under his successors, and Nominoé, proclaimed king in 842, razed the fortifications of Nantes because it had sided with Charles the Bald. The Normans held the town from 843 to 936. About this time began the rivalry between Nantes and Rennes, whose counts disputed the sovereignty of Brittany. Pierre de Dreux, declared duke of Brittany by Philip Augustus, made Nantes his capital, surrounded it with fortifications and defended it against John of England During the Breton wars of succession Nantes took part first with Jean de Montfort, but afterward with Charles of Blois, and did not open its gates to Montfort till his success was assured and his English allies had retired. In 1560 Francis II granted Nantes a communal constitution. Averse to Protestantism, it joined the league along with the duke of Mercoeur, governor of Brittany, who helped to raise the country into an independent duchy; and it was not till 1598 that it opened its gates to Henry IV, who there signed on May 2 the Edict of Nantes which until its revocation by Louis XIV in 1685 was the charter of Huguenot liberties in France. The city was in 1793 the scene of the *noyades* of J. B. Carrier, envoy of the Committee of Public Safety.

The Port.—The maritime port of Nantes is reached by way of the Loire and the ship canal between the island of Carnet and La Martinière (9½ mi.). Vessels drawing as much as 20 ft. 8 in., and at spring tides, 22 ft., can reach the port, which extends over a length of about 1½ mi. The outer port stretches ½ mi. to Chantenay. The principal quays extend along the right bank of the branch which flows past the town and on the western shore of the island of Gloriette. Their total length used for trading purposes is 5 mi., and warehouses cover an area of 17 ac. A slipway facilitates the repairing of ships.

The river port occupies the St. Félix and Madeleine branches and has quays extending for half a mile. Finally, on the Erdre is a third port for inland navigation. The quays are bounded by railway lines along the right bank of the river, which the railway to St. Nazaire follows. The older quarter of Nantes is situated to the east of the Erdre.

Buildings.—The cathedral, built above a 12th-century crypt, was unfinished till the 19th century. There are two interesting monuments in the transept; Michel Colomb's tomb of Francis II, duke of Brittany, and his second wife Marguerite de Foix (1507) and that of Gen. Juchault de Lamoricière, a native of Nantes, by Paul Dubois (1879). Between the cathedral and the Loire stands the castle of Nantes, founded in the 9th or 10th century. Rebuilt by Francis II and the Duchess Anne, it is flanked by huge towers and by a bastion erected by Philip Emmanuel, duke of Mercoeur, in the time of the league. A fine Gothic façade looks into the courtyard. From being the residence of the dukes of Brittany, the castle became a state prison and is now occupied as the artillery headquarters. The chapel in which the marriage of Louis XII with Anne of Brittany was celebrated was destroyed in 1800.

Nantes has an archaeological collection in the Dobrée museum, and in the museum of fine arts a splendid collection of paintings, modern French masters being well represented. It is the seat of a prefect, of a bishopric under the archbishop of Tours and a court of assizes and headquarters of the 11th army corps; it has tribunals of first instance and of commerce, a board of trade-arbitrators and a chamber of commerce. It has many educational institutions.

Industries.—Among the more important industries of Nantes are sugar-refining, rice-husking, the manufacture of oil, soap, flour pastes and biscuits, chocolate and the preparation of tinned provisions (sardines, vegetables, etc.); the manufacture of tin boxes, tiles, chemical manures, acid, leather, paper, rope, boots and shoes, brushes, porcelain and glass; shipbuilding, metal founding and the construction of engineering material; and wool and cotton-spinning and the manufacture of cotton and other fabrics, rubber goods, hosiery and knitted goods. Coal and petroleum, sugar, coffee, cottonseed, copra, hemp, grain, phosphates and pyrites, timber and pulpwood are imported. Principal exports are machinery, pit props, iron ore, slate, hoops and provisions. The merchandise handled at the port of Nantes slightly increased after 1913 when the amount of goods handled at the port was 1,964,000 tons (metric). In 1924 it was 2,154,000 and in 1925, 2,086,000 metric tons.

NANTES, EDICT OF, the law promulgated in April 1598 by the French king, Henry IV, which secured a large measure of religious liberty to his Protestant subjects, the Huguenots. Its main provisions may be summarized as follows: (1) It gave liberty of conscience to the Protestants throughout the whole of France. (2) It gave them the right of holding public worship in those places where they had held it in 1576 and the earlier part of 1577; also in places where this freedom had been granted by the edict of Poitiers (1577) and the treaties of Nérac (1579) and of Fleix (1580). The Protestants could also worship in two towns in each *bailliage* and *sénéchaussée*. The greater nobles could hold Protestant services in their houses; the lesser nobles could do the same, but only for gatherings of not more than 30 people. In regard to Paris, the Protestants could conduct worship within five leagues of the city instead of ten leagues as previously. (3) Full civil rights were granted them. They could trade freely, inherit property and enter the universities, colleges and schools. All official positions were open to them. (4) To deal with disputes arising out of the edict, a chamber was established in the parliament of Paris (*le chambre de l'édit*). This group was to be composed of ten Roman Catholic and six Protestant members. Chambers for the same purpose, but consisting of Protestants and Roman Catholics in equal numbers, were established in connection with the provincial parliaments. (5) The Protestant pastors were to be paid by the state and to be freed from certain burdens, their position being made practically equal to that of the Roman Catholic clergy. (6) A hundred places of safety were given to the Protestants for eight years, the expenses of garrisoning them being undertaken by the king.

The edict was greatly disliked by the Roman Catholic clergy, and a few changes were made to conciliate them. The parliament of Paris shared this dislike, but was forced by the king to register the edict on Feb. 25, 1599. After similar trouble it was also registered by the provincial parliaments, the last being the parliament of Rouen, which delayed the registration until 1609.

That the strong political position thus secured to the French Protestants was a danger to the state was proved by the troubles which arose during the minority of Louis XIII. After Richelieu had succeeded in crushing the quasi-independent power of the Huguenot lords and cities, however, the French Protestants ceased to be a political danger. With the revocation of the Edict of Nantes, on Oct. 18, 1685, the French Protestants were deprived of all civil and religious liberty.

NANTEUIL, ROBERT (1623–1678), French line-engraver, was born about 1623, or, as other authorities state, in 1630, the son of a merchant of Reims. Having received an excellent classical education, he studied engraving under his brother-in-law, Nicholas Regnesson. He became known by his crayon portraits, and was pensioned by Louis XIV and appointed designer and engraver of the cabinet to that monarch. It was mainly due to his influence that the king granted the edict of 1660, dated from St. Jean de Luz, by which engraving was pronounced free and distinct from the mechanical arts, and its practitioners were declared entitled to the privileges of other artists. He died at Paris in 1678. The plates of Nanteuil, several of them almost life-size, number about 300. In his early practice he imitated the technique of his predecessors, working with straight lines, strengthened, but not crossed, in the shadows, in the style of Claude Mellan, and in other prints cross-hatching like Regnesson, or stippling in the manner of Jean Boulanger. He then gradually acquired an individual style, modelling the faces of his portraits with the utmost precision and completeness, and employing various methods of touch for the draperies and other parts of his plates. Among the finest of his mature works are the portraits of Pomponne de Bellièvre, Gilles Ménage, Jean Loret, the duc de la Meilleraye and the duchess de Nemours.

A list of his works will be found in Dumesnil's *Le Peintre-graveur français*, vol. iv.

NANTICOKE, a city of Luzerne county, Pennsylvania, U.S., on the Susquehanna river and federal highway 11, 8 mi. W.S.W. of Wilkes-Barre. It is served by the Pennsylvania railroad and (through West Nanticoke) by the Lackawanna, and for freight also by the Central of New Jersey. Pop. (1950) 20,160. It is an anthracite-mining centre and has factories making nylon, rayon and cotton yarns, dresses, stockings and cigars. Nanticoke was laid out in 1793 and was incorporated in 1874.

NANTUCKET, an island 28 mi. S. of Cape Cod off the southeast coast of Massachusetts, U.S., for more than a century a principal seat of the whaling industry. In 1830 the town of Nantucket ranked after Boston and Salem as the third commercial city of the state; in 1842 it was the home port of 86 ships and barks, 2 brigs and 2 schooners, with a total capacity of 36,000 tons. Leadership in the industry passed to New Bedford about 1830,

however, and soon after 1840 the decline of whaling began in earnest. Retaining its old atmosphere and a distinctive physical character inherited from years of Quaker dominance and whaling prosperity, Nantucket has become a summer resort. Pop. (1950) 3,484. For the most part the island is sandy and level. It has few trees and few hills, the highest of which is 191 ft. above the sea. Although the length of the island proper is only about 15 mi., and its average width $2\frac{1}{2}$ mi., there are 88 mi. of shore and an excellent harbour, 7 mi. long. The climate is profoundly modified by this insular position.

Nantucket was discovered by Bartholomew Gosnold and purchased, with Martha's Vineyard, by Thomas Mayhew of Watertown in 1641. Thomas Macy led the first band of settlers in 1659, founding a settlement near Capaum which was called Sherburne in 1673. The island at that time belonged to the province of New York. In 1692 it became part of the state of Massachusetts, and in 1710 the town moved from Sherburne to its present site on Nantucket harbour. In 1695 the name was changed to Nantucket, which is the name of the town, county (including the smaller islands of Tuckunuck and Muskeget) and island. Christopher Hussey took the first sperm whale in 1712, and development of the vessel fishery, succeeding the old shore fishery of whales, was rapid. The American Revolution, the War of 1812 and the American Civil War were the only interruptions to the prosperity based upon whaling until its final decline.

(H. B. H.; X.)

NANTWICH, a market town and urban district in the Crewe parliamentary division, Cheshire, England, 161 mi. N.W. of London, on the London Midland Region and Western Region railway routes. Pop. (1951) 8,840. Area 1.83 sq.mi. It lies on the river Weaver, in the upper part of its flat, open valley. The church of St. Mary is a cruciform building in red sandstone, of the Decorated and Perpendicular periods, with a central octagonal tower. The fine old carved stalls are said to have belonged to Vale Royal abbey, near Winsford. Nantwich retains a few old timbered houses (16th and 17th centuries), but the town as a whole is modern in appearance. The grammar school, founded in 1611, is now coeducational. The salt industry was so important there in the time of Henry VIII that there were 300 saltworks. Though this industry has lapsed, there are now brine baths, and the former mansion of Shrewbridge Hall is converted into a hotel with a spa. Nantwich manufactures clothing and boots and shoes. There is also a tannery and a corn mill.

Remains found in the district indicate a Roman settlement there, probably because of the salt. The Domesday survey contains a long account of the laws, customs and values of the saltworks. The salting houses were divided between the king, the earl of Chester and certain resident freemen. The name of the town appears variously as Wych Manbank, Wie Malban, Nantwich, Lache Mauban, Wysmanban, Wiens Malbanus and Namptewiche. About the year 1070 William Malbedeng was created baron of Nantwich, but the barony became subdivided later. The only town charter was granted by Queen Elizabeth (1568). There was a gild merchant and also a town bailiff, but the latter office was soon dropped. There is documentary evidence of a castle at Nantwich in the 13th century.

NANTY-GLO, a coal-mining borough of Cambria county, Pennsylvania, U.S., 12 mi. N. of Johnstown; served by the Cambria and Indiana and the Pennsylvania railways. Pop. 5,425 in 1950; 6,217 in 1940 by the federal census.

NAOMI (Hebrew, "pleasant"; also Noemi in Douay version), mother-in-law of Ruth in the old testament Book of Ruth. She was the wife of Elimelech of Bethlehem and the mother of Mahlon and Chilion.

During a famine in Bethlehem, the family went to the country of Moab. After the death of both her husband and her two sons, Naomi returned with her daughter-in-law, Ruth, to Bethlehem in Judah. Ruth was a native of Moab, but she was devoted to her mother-in-law and insisted on remaining with her.

As a result of her misfortunes, Naomi was not recognized readily when she returned to Bethlehem. Whereupon she said, "Call me not Naomi, call me Mara (bitterness); for the Almighty hath dealt very bitterly with me."

During the harvest, Ruth went to work in the corn fields of Boas, a wealthy kinsman of Naomi. After Ruth and Boas met, Naomi advised and encouraged Ruth to remarry and was soon successful. Naomi later became the nurse for Obed, the son who was born to Ruth and Boas.

(*See* RUTH, BOOK OF.)

NAOROJI, DADABHAI (1825–1917), Indian politician, was born at Nasik on Sept. 4, 1825, the son of a Parsi priest. During a long and active life, he played many parts: professor of mathematics at the Elphinstone college (1854); founder of the *Rast Goftar* newspaper; partner in a Parsi business firm in London (1855); prime minister of Baroda (1874); member of the Bombay legislative council (1885); M.P. for Central Finsbury (1892–95), being the first Indian to be elected to the house of commons; and three times president of the Indian National congress. Many of his numerous writings were collected in *Poverty and Un-British Rule in India* (1901).

NAOS, in architecture the Greek name for temple or, more specifically, the enclosed part (cella) of it. When the cella contains but one room, this is the naos; when it contains two, the naos is the larger of these, in which the statue of the deity is placed.

NAP, the pile on cloth, the surface of short fibres raised by special processes, differing with the various fabrics, and then smoothed and cut. Formerly the word was applied to the roughness on textiles before shearing. "Nap" in this sense appears in many Teutonic languages, cf. German *Noppe*, Dutch *nop*, Norwegian *napp;* the verbal form is *noppen* or *nappen*, to trim, cut short. The word nap also means a short sleep or doze (O. Eng. *hnappian*). In "napkin," a square of damask or other linen used for wiping the hands and lips or for protecting the clothes at meals, the second part is a common English suffix, sometimes of diminutive force, and the first is from "nape," Low Lat. *napa* or *nappa*, a corrupt form of *mappa*, tablecloth. "Nape," the back of the neck, is of doubtful origin; it may be a variant of "knap," a knob or protuberance. Nape still survives in "napery," a name for household linen in general.

NAPA, a city of California, U.S., 11 mi. N. of San Pablo bay and 40 mi. N. by E. of San Francisco, at the head of navigation on the tidal Napa river; the county seat of Napa county. It is served by the Southern Pacific railway. The population in 1950 was 13,579; and 7,740 by the federal census of 1940.

Napa is the commercial and industrial centre of the fertile Napa valley, which is famous for its grapes, nuts, prunes, early pears, apples, oats, alfalfa and other ranch products. The city's manufactures include shoes, gloves, shirts, athletic equipment, paper boxes, stone, dried fruits, butter, cheese, mineral water and grape juices. Napa was settled in 1831 and incorporated as a city in 1872.

NAPERVILLE, a city of Du Page county, Illinois, U.S., on the Burlington Route railway, 28 mi. W. of Chicago. Pop. 7,013 in 1950 and 5,272 in 1940 by the federal census. It has greenhouses, nurseries, poultry farms and several factories, and is the seat of North Central college, founded by the Evangelical church in 1861 at Plainfield, Ill., and moved to Naperville in 1870, and of the Evangelical Theological seminary (1910). The city was founded about 1831.

Naperville has a city commission form of government. The mayor and four councilmen are directly elected for terms of four years.

A sewage treatment plant and water works are city-owned and operated. The city also controls distribution of electricity.

Two weekly newspapers, the *Clarion* and the *Sun,* and a semimonthly newspaper, *Organized Farmer*, are published in Naperville. Manufactured products include furniture, carbon, concrete, toys, machine tools and burlap bags. Agricultural products include corn, oats, hay and grain.

NAPHTALI was, according to Gen. xxx, 8, a son of Jacob by Rachel's handmaid Bilhah, and full brother of Dan. This may be no more than a reflection of the fact that geographically the tribes of Dan and Naphtali are closely associated. Not only did the land of Naphtali in northern Palestine border on that of Dan, but there is in Deut. xxxiii, 23, an indication that Naphtali dwelt near to Dan in the older seat of the latter tribe in the southwest. The story of the conflict against Sisera, Judges iv, *et seq.*, associates Zebulon closely with Naphtali, and informs us that from Kadesh, the old Amorite city which was the chief place in Naphtali's territory, came the hero Barak. Naphtali, because of its exposed situation, suffered at the hands of Syria (I Kings xv, 20); it was depopulated by Tiglath-Pileser (II Kings xv, 29). The reference to Naphtali in the Blessing of Jacob, Gen. xlix, 21, is obscure and of uncertain interpretation. (W. L. W.)

NAPHTHA, a word originally applied to the more volatile kinds of petroleum, issuing from the ground in the Baku district of Russia and in Persia. It is the *νάφθα* of Dioscorides, and the *naphtha*, or *bitumen liquidum candidum* of Pliny. By the alchemists the word was used principally to distinguish various highly volatile, mobile and inflammable liquids, such as the ethers, sulphuric ether and acetic ether having been known respectively as *naphtha sulphurici* and *naphtha aceti*.

The term is now seldom used, either in commerce or in science, without a distinctive prefix, as in the following:

1. *Coal Tar Naphtha.*—A volatile commercial product obtained by the distillation of coal tar. (*See* COAL TAR.)
2. *Shale Naphtha.*—Obtained by distillation from the oil produced by the destructive distillation of bituminous shale. (*See* PARAFFIN.)
3. *Petroleum Naphtha.*—A name sometimes given (*e.g.*, in the United States) to a portion of the more volatile hydrocarbons distilled from petroleum. (*See* PETROLEUM.)
4. *Wood Naphtha.*—Methyl alcohol (*q.v.*).

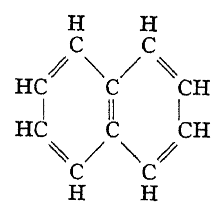
NAPHTHALENE, a hydrocarbon, $C_{10}H_8$, formed when many organic compounds are passed as vapours through a red-hot tube. This accounts for its presence in coal tar (*q.v.*), from the distillates of which it was first isolated by A. Garden in 1819, and also for its formation in modern processes for the high-temperature catalytic cracking of petroleum. Its composition was first determined by Michael Faraday in 1826. Naphthalene is the most abundant single constituent of coal tar, being present to the extent of about 5%. The amount depends on the type of coal used and increases with rising temperature of carbonization. Naphthalene may be carried with the coal gas through the various purifying chambers and deposited in the service pipes to such an extent as to cause partial blockage. For the technical production of naphthalene the appropriate coal-tar distillate, boiling point 170° C. to 230° C., known as middle oil or carbolic oil, is strongly cooled, whereupon the naphthalene crystallizes and may be pressed free from most of the adhering oil. For purification, it is treated with hot caustic soda to remove acidic phenols and then, in the molten state, with a little concentrated sulphuric acid to remove bases and other impurities; it is finally distilled or sublimed.

When the rising demand for naphthalene as a chemical raw material began to create a shortage, substitutes were sought. By a process known as hydroforming the normal paraffin hydrocarbons of petroleum undergo catalytic dehydrogenation and cyclization to aromatic hydrocarbons. In this way a suitable petroleum fraction may be converted into xylenes, from which orthoxylene may be separated and used for the production of phthalic anhydride by vapour-phase oxidation. This gave promise of providing an important new source of phthalic anhydride, formerly manufactured almost entirely by oxidation of naphthalene.

Properties and Uses.—Pure naphthalene crystallizes in lustrous white plates, melting at 80.1° C. and boiling at 218° C. It is almost insoluble in water, sparingly soluble in cold alcohol and in petroleum spirit, but is readily soluble in ether and in hot alcohol. It is characterized by its volatility (also with steam), and it readily sublimes. It forms with picric acid a stable crystalline molecular compound, $C_{10}H_8,C_6H_2(NO_2)_3OH$, melting point 151° C., the formation of which may be used for the characterization and quantitative estimation of naphthalene. The hydrocarbon has a characteristic odour; as "carbon balls" or moth balls, it was formerly used as a moth repellent but was replaced for this purpose by more efficient insecticides such as paradichlorobenzene, D.D.T. and gammexane (benzene hexachloride). Naphthalene has toxic properties, and when administered to rabbits produces a form of cataract, or opalescence of the lenses of the eye. It becomes detoxified by combination with cysteine, forming naphthalene-α-mercapturic acid, which has been isolated from urine. Naphthalene was also shown to undergo metabolic oxidation to 1:2-dihydroxy-1:2-dihydronaphthalene. The products obtained by chemical oxidation of naphthalene vary considerably with the conditions and type of oxidizing agent. Chromic acid in acetic acid gives mainly 1:4-naphthoquinone, whereas potassium permanganate in alkaline solution gives phthalonic acid. In acid solution phthalic acid is the chief product, and this is also formed by oxidation with potassium dichromate and sulphuric acid. Phthalic acid was formerly manufactured by oxidizing naphthalene with hot concentrated sulphuric acid in the presence of mercuric sulphate. This process has been superseded by vapour-phase catalytic oxidation with air, using a vanadium pentoxide catalyst; the phthalic acid which is formed is dehydrated to phthalic anhydride, which sublimes into a condenser.

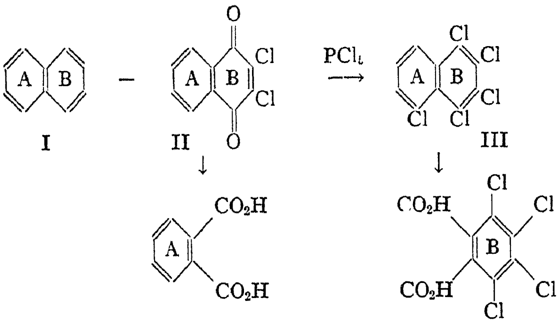
Naphthalene is extensively used as a raw material for the manufacture of dyestuffs and synthetic resins. Phthalic anhydride may be converted into anthranilic acid, an intermediate in the manufacture of indigo; into triphenylmethane dyes; and into anthraquinone and its derivatives, which form the starting material for the preparation of fast vat dyes such as indanthrene and flavanthrene. Phthalic anhydride is also much used for the production of alkyd resins and glyptals in which it is combined with polyhydric alcohols such as glycerol (*see* RESINS). Naphthalene gives rise to a host of substitution products which are important components in the manufacture of azo dyes. These intermediates are principally naphthalene derivatives which contain hydroxyl, amino and sulphonic acid groups in various combinations. One of the earliest of the sulfonamide drugs, prontosil soluble, is an azo dye derived from an aminonaphtholdisulphonic acid. It was subsequently found, however, that the therapeutic effect is in no way dependent on the azonaphthalene grouping, which is in fact disadvantageous.

Constitution.—The empirical formula of naphthalene, $C_{10}H_8$, points to a high degree of unsaturation. The hydrocarbon is, however, not much more unsaturated than benzene, and on treatment with chemical reagents gives mainly substitution products. By catalytic hydrogenation under fairly vigorous conditions, the molecule takes up ten atoms of hydrogen, giving decahydronaphthalene, $C_{10}H_{18}$. This still contains four hydrogen atoms less than the paraffin hydrocarbon, decane, $C_{10}H_{22}$. From these considerations it may be inferred that the molecule of naphthalene contains two rings. That there are, in fact, two rings, each of them a benzene ring, was suggested as early as 1866 by E. Erlenmeyer, Sr., who proposed the following structural formula based on F. A. Kekulé's structure for benzene.



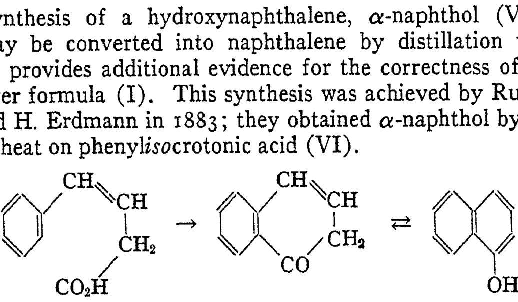
This formula shows two benzene rings combined in such a manner that two carbon atoms are common to both rings. For ease of writing, this formula is usually contracted as shown in formula I. Erlenmeyer's suggestion was confirmed in 1868–69 by C. Graebe, who obtained from naphthalene a series of degradation products which showed conclusively the presence of two distinct benzene rings. He oxidized dichloronaphthoquinone (II), which had been prepared from naphthalene by Auguste Laurent, in 1840, and obtained phthalic acid, or benzene-1:2-dicarboxylic acid (IV). This indicates the presence of an unsubstituted benzene

ring in the dichloroquinone. When the latter was treated with phosphorus pentachloride, there was formed a pentachloronaphthalene, which must be represented by a structure in which four chlorine atoms are attached to one ring and the fifth to the other ring (*e.g.*, III), for oxidation with nitric acid gave tetrachlorophthalic acid (V). Clearly the formation of phthalic acid must involve degradation of one ring (B), and the formation of tetrachlorophthalic acid the degradation of a different ring (A).



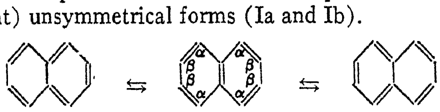
I II III IV V

The synthesis of a hydroxynaphthalene, α-naphthol (VII), which may be converted into naphthalene by distillation with zinc dust, provides additional evidence for the correctness of the Erlenmeyer formula (I). This synthesis was achieved by Rudolf Fittig and H. Erdmann in 1883; they obtained α-naphthol by the action of heat on phenyl*iso*crotonic acid (VI).



VI VII

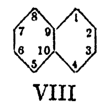
Just as Kekulé suggested that benzene should be represented by a dynamic formula, in which two (equivalent) Kekulé forms represent extreme phases in the vibration of the molecule, so also Erdmann suggested that naphthalene should be similarly represented by a dynamic formula in which the Erlenmeyer symmetrical structure represents an intermediate position between two (equivalent) unsymmetrical forms (Ia and Ib).



Ia I Ib

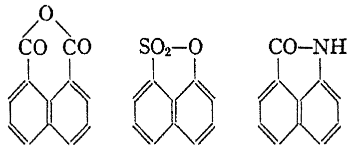
The exact nature of the valence-bond structure of naphthalene has been the subject of much investigation. Some naphthalene derivatives behave as if they have exclusively the Erlenmeyer structure I. This fact may, however, indicate merely the way in which the molecule can be polarized by the attacking reagents in the courses of the reactions in question, and it does not require that, in the unreacting molecule, the bonds be rigidly fixed in the way characteristic of the Erlenmeyer structure. L. C. Pauling approached the problem from the standpoint of the theory of resonance and pointed out that the three bond structures (I, Ia, Ib) are the most stable bond structures, that they have approximately the same energy and that they correspond to approximately the same molecular configuration. They would therefore be expected to contribute, through resonance, about equally to the normal state of the naphthalene molecule. Resonance among these *three* stable structures should, according to Pauling, stabilize the molecule to a greater extent than the Kekulé resonance in benzene, which involves *two* equivalent structures. The resonance energy of naphthalene (63.5 kg.cal./mole) is in fact much greater than that of benzene (39 kg.cal./mole). The chemical reactivity of naphthalene derivatives was interpreted by Pauling in terms of this resonance concept, which led to the conclusion that the bonds between α- and β-carbon atoms (formula I) have $\frac{2}{3}$ double-bond character whereas the others have $\frac{1}{3}$ double-bond character. X-ray crystallographic measurements show the naphthalene molecule to be planar, and a very accurate X-ray analysis by J. M. Robertson revealed small but definite differences between the lengths of the $\alpha\beta$- and $\beta\beta$-bonds. At the present time it is conventional to write the structure of napthalene either in the Erlenmeyer form I, or else, more simply, as two fused hexagons, as in VIII, below.

It follows from the structural formula of naphthalene that the eight hydrogen atoms are not equivalent. They fall into two groups: four occupy α-positions and the other four occupy β-positions (see formula I). Consequently, monosubstitution products exist in two isomeric forms. For di-substituted derivatives theory requires the existence of 10 isomerides if the two substituents are identical, but 14 if they are different. If there are three identical substituents the number of isomerides is 14. The positions of substituents are denoted by numbering the carbon atoms, as in formula VIII. For simple naphthalene derivatives it is unnecessary to number the two "submerged" carbon atoms which are not associated with replaceable hydrogen atoms. In the fully reduced naphthalene derivatives, however, substituents may be attached to these carbon atoms, which are accordingly designated 9 and 10.



VIII

The 1 and 8 positions of naphthalene (*peri* positions) show some similarity to the *ortho* positions of benzene. Thus, naphthalene-1:8-dicarboxylic acid (naphthalic acid), like phthalic acid, readily forms an anhydride (IX). Similar dehydration, with formation of a peri bridge, takes place with 1:8-naphtholsulphonic acid and 1:8-aminonaphthoic acid, which give naphthasultone (X) and naphthastyril (XI), respectively. To this class belongs also the coal tar hydrocarbon, acenaphthene.



IX X XI

Just as 1:8-derivatives are designated *peri-*, so 2:6-derivatives are often designated *amphi-*.

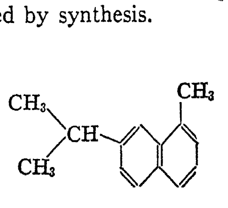
Chemical Reactions.—In its chemical behaviour naphthalene shows the aromatic character associated with benzene and its simple derivatives. Its reactions are mainly reactions of substitution, and naphthalene may be readily chlorinated, brominated, nitrated and sulphonated, and it will undergo the Friedel-Crafts reaction. In reactions such as nitration and halogenation, the substituent enters the more reactive α-positions almost exclusively, although chlorination and bromination lead to a certain extent to β-substitution. Reversible reactions subject to steric hindrance lead to substitution in the less hindered β-positions to an extent which increases with increase in reaction temperature, but varies with the nature of the reagent and sometimes with the solvent. This is exemplified by the Friedel-Crafts reaction. With acetyl chloride and aluminum chloride in carbon disulphide solution at −15° C., naphthalene gives a mixture of α-acetylnaphthalene and β-acetylnaphthalene in a ratio of about 3:1. These may be separated by crystallization of their picrates, the β-compound being much less soluble. In nitrobenzene solution the chief product is the β-ketone. These acetylnaphthalenes may be converted by oxidation with hypochlorite into the corresponding α- and β-naphthoic acids. In the sulphonation of naphthalene the α-sulphonic acid is formed at low temperatures (below the melting point of naphthalene) whereas the β-sulphonic acid is formed at high temperatures (optimum temperature, 160° C. to 170° C.). By heating with sulphuric acid, the α-acid is converted into the β-acid. These temperature effects have been shown to be due to the fact that the α-acid is hydrolyzed about 50 times more rapidly than the β-acid, and the difference becomes more marked with rise of temperature and concentration of sulphuric acid. Increase in temperature or acid concentration thus favours the formation of β-sulphonic acid.

Naphthalene is more reactive than benzene, and substitution reactions usually take place under milder conditions in the case of naphthalene. A striking example of this is given by the Friedel-Crafts reaction between naphthalene and phthalic anhydride, which may be carried out in benzene solution without appreciable formation of *o*-benzoylbenzoic acid. In addition reactions, naphthalene also shows greater reactivity. It is reduced by sodium and ethyl alcohol to the 1:4-dihydride, whereas benzene is unattacked. With sodium and amyl alcohol naphthalene is reduced to the tetrahydro compound (tetralin), and the reaction stops abruptly at this stage because the product is a simple benzene derivative which is resistant to addition of hydrogen. Naphthalene, but not benzene, reacts by addition with alkali metals. Thus, sodium in dimethyl ether at −70° C. to −80° C. gives sodium naphthalene, which appears to be a mixture of two isomerides, for reaction with carbon dioxide gives a mixture of 1:4-dihydronaphthalene-1:4-dicarboxylic acid and 1:2-dihydronaphthalene-1:2 dicarboxylic acid. Naphthalene also adds chlorine more readily than benzene, and by treatment with the dry gas there is formed the tetrachloride, $C_{10}H_8Cl_4$.

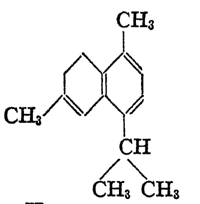
NAPHTHALENE DERIVATIVES

Homologues.—Many of the alkyl derivatives of naphthalene have played an important part in the elucidation of the molecular structures of naturally occurring sesquiterpenes, triterpenes and related compounds. They are also present in coal tar. The simplest of these hydrocarbons are α- and β-methylnaphthalenes, both of which are coal tar constituents. E. A. Coulson described a process by which they may be isolated by fractional distillation of a suitable tar oil fraction, using a column having a rectifying efficiency corresponding with about 100 theoretical plates. α-Methylnaphthalene is a liquid, boiling point 240° C., and β-methylnaphthalene is a low-melting crystalline solid. Eight of the ten possible dimethylnaphthalenes have been isolated from coal tar and two of them (1:6 and 2:6) from Rumanian petroleum. The best known of these are the 1:6-, 2:3-, 2:6- and 2:7-dimethylnaphthalenes. The 1:6- compound is a liquid; the other three are solids which crystallize in colourless glistening plates. Of the trimethylnaphthalenes, the 2:3:6-, 1:3:7- and 2:3:5-compounds have been isolated from coal tar. From the high-boiling fractions of aromatic hydrocarbons obtained by high-temperature catalytic cracking of petroleum there have been isolated α-and β-methylnaphthalenes; 1:2-, 1:6-, 1:7-, and 2:6-dimethylnaphthalenes; and 1:2:5- and 1:2:6- trimethylnaphthalenes.

The sesquiterpenes are hydrocarbons of the formula $C_{15}H_{24}$, which occur in the essential oils of certain plants. Some of them are hydronaphthalene derivatives; among these are cadinene, which is present in oil of cubebs, and selinene, present in celery seed oil. Closely related to the latter is eudesmol, $C_{15}H_{26}O$, an alcohol which occurs in eucalyptus oil, and cyperone, an unsaturated ketone which is a constituent of oil of *Cyperus rotundus*. Selinene, eudesmol and cyperone (after reduction) may be converted by dehydrogenation with sulphur or selenium into eudalene, or 1-methyl-7-isopropylnaphthalene (I). Cadinene under similar conditions gives cadalene or 1:6-dimethyl-4-isopropylnaphthalene (II). The structures of these two naphthalene hydrocarbons have been established by synthesis.



I



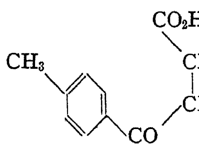
II

Other naturally occurring hydronaphthalene derivatives are santonin, a keto-lactone which is the active principle of wormseed, and its hydroxy derivative Artemisin, which accompanies it in *Artemisia marina*.

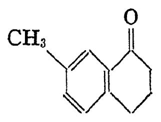
Some monocyclic sesquiterpenes also give eudalene or cadalene by dehydrogenation. The process involves the formation of a second ring. Such compounds are zingiberene, from ginger oil, and bisabolene, from oil of lemons, which both give cadalene. A terpene derivative of a somewhat different type is vitamin A, which gives 1:6-dimethylnaphthalene on heating with selenium. In this case also, the naphthalene hydrocarbon results from the formation of a second ring by cyclization of a side chain under the conditions of the reaction. There are other examples in which both rings of the naphthalene system are formed by cyclization of an unsaturated open chain. Thus, 2:6-dimethylnaphthalene has been obtained by thermal decomposition of the carotenoid pigments β-carotene, zeaxanthin and crocetin dimethyl ester.

The triterpenes are mainly pentacyclic compounds which undergo extensive degradation under the conditions of selenium dehydrogenation. Typical naphthalene derivatives which are formed by this procedure are 2:7-dimethylnaphthalene, 1:2:5-trimethylnaphthalene (agathalene), 1:2:7-trimethylnaphthalene (sapotalene), 6-hydroxy-1:2:5-trimethylnaphthalene and 1:2:5:6-tetramethylnaphthalene. (*See* also TERPENES.)

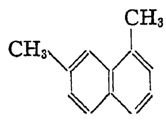
To assist the identification of the naphthalene hydrocarbons formed by the dehydrogenation of terpenes, all of the 14 theoretically possible trimethylnaphthalenes have been synthesized as well as all 10 possible dimethylnaphthalenes. Naphthalene homologues may be synthesized either by introducing alkyl groups into simpler naphthalene derivatives or by building up the second ring from a side chain attached to a suitable benzene derivative. The second method, although more laborious, is more generally serviceable. There are many variants, and a great variety of naphthalene derivatives may be constructed by methods which establish the points of attachment of the substituents. For instance, toluene and succinic anhydride may be caused to interact by the Friedel-Crafts process to give a keto acid (III) which after reduction is cyclized to 1-keto-7-methyl-1:2:3:4-tetrahydronaphthalene (IV). This, with methylmagnesium iodide, gives a carbinol which may be dehydrated and then dehydrogenated to 1:7-dimethylnaphthalene (V).



III

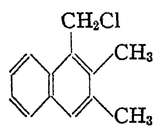


IV

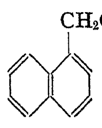


V

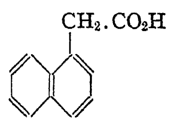
Methyl groups may be introduced into the naphthalene molecule by the action of methyl sulphate on organometallic compounds. Thus, bromination of 2-methylnaphthalene gives the 1-bromo derivative which reacts with lithium to give a lithium compound. This, on treatment with methyl sulphate, gives 1:2-dimethylnaphthalene in excellent yield. Another method consists in chloromethylation followed by reduction. By this means methyl groups may be progressively introduced into the molecule As an example of this method, 2:3-dimethylnaphthalene has been treated with paraformaldehyde and hydrochloric acid to give the chloromethyl derivative (VI), which on reduction gave 1:2:3-trimethylnaphthalene. By a repetition of the process another methyl group was introduced at position 4.



VI



VII



VIII

The chloromethylation reaction may be used for the preparation of other types of naphthalene derivatives. Thus, naphthalene itself gives the 1-chloromethyl compound (VII), which reacts with potassium cyanide to give a nitrile; this is hydrolyzed to α-naphthylacetic acid (VIII), a substance which has found extensive use as a plant-growth substance. It stimulates root formation in a manner similar to the natural plant growth hormone, heteroauxin, or indolyl-3-acetic acid.

Less homogeneous alkylnaphthalenes are prepared industrially

by treating naphthalene with unsaturated hydrocarbons, such as propylene, in the presence of a suitable condensing agent. Sulphonation of the resulting hydrocarbons gives surface-active agents which find application as wetting agents or synthetic detergents.

Naphthylamines, Naphthols and their Sulphonic Acids.—A very wide range of naphthalene derivatives of these types is manufactured for use in the dyestuffs industry, being used mainly as components for azo dyes (*see* DYES, SYNTHETIC). When their potentialities for this purpose were first recognized, their chemistry was very imperfectly understood. Manufacturing processes in many cases gave rise to mixtures which were difficult to separate, and of which the constituents were poorly characterized and the orientation of their substituents only partly determined. In establishing the chemistry of these derivatives of naphthalene on a firm basis, inestimable service was rendered by the classical researches of H. E. Armstrong and W. P. Wynne, who prepared all of the theoretically possible mono-, di- and trichloronaphthalenes (26 in all), established their orientations with absolute certainty and provided a series of reference compounds to which the many naphthalene-, naphthylamine- and naphtholsulphonic acids could be related. P. T. Cleve observed, in 1876, that when a naphthalene-sulphonyl chloride was distilled with phosphorus pentachloride it was converted into the corresponding chloronaphthalene, and that β-naphthol when treated in the same way gave β-chloronaphthalene. Armstrong and Wynne used this as a diagnostic method and showed that bromo- and nitro- substituents were also displaced by chlorine when the compounds containing them were distilled with phosphorus pentachloride. Amino groups could be displaced by chlorine by T. Sandmeyer's method, or replaced by hydrogen through the diazo reaction. By such reactions a naphthalene derivative of unknown structure could be converted into a chlorinated naphthalene of known orientation, from which the positions of substituents in the original compound could be deduced.

The preparation of naphthalene derivatives for use as dyestuffs intermediates involves either nitration or sulphonation of naphthalene as the first stage. As stated above, naphthalene is generally more reactive than benzene, and nitration is very vigorous. This latter reaction is effected by treatment of finely powdered naphthalene with mixed acid (a mixture of concentrated nitric and sulphuric acids), and the temperature should be kept below the melting point of naphthalene (50° C. to 60° C.). This leads to α-nitronaphthalene, which crystallizes in yellow needles, melting point 57.8° C. On further nitration, α-nitronaphthalene yields a mixture of 1:5- and 1:8-dinitronaphthalenes, the substituents always entering α-positions of the naphthalene molecule. β-Nitronaphthalene is of no technical importance, and must be prepared indirectly; for example, by treatment of diazotized β-naphthylamine with potassium nitrite in presence of copper bronze.

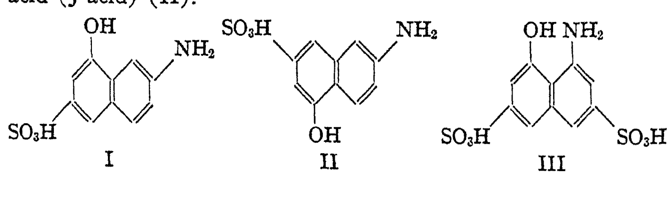
α-Naphthylamine is obtained from α-nitronaphthalene by reduction with iron turnings and water acidulated with hydrochloric acid. After complete reduction, the acid is neutralized and the basic α-naphthylamine is obtained by distillation with superheated steam. It may also be purified by distillation under reduced pressure. It crystallizes in colourless leaflets, melting point 49.2° C. On exposure to air it rapidly acquires a grayish-violet colour and has a somewhat disagreeable odour. α-Naphthylamine and aniline react, when the mixture is heated with a little sulphanilic acid, to give the secondary base, phenyl-α-naphthylamine. This serves, together with alkylated naphthylamines, for the preparation of basic diphenylnaphthylmethane colours of the type of Victoria blue. By heating under pressure with dilute sulphuric acid (200° C.; 14 atm.), α-naphthylamine is hydrolyzed to the corresponding hydroxynaphthalene, α-naphthol. This phenolic substance crystallizes in white lustrous prisms, melting point 96° C., and is used as a dyestuffs intermediate. By submitting the sulphate of α-naphthylamine to a process of baking in a vacuum it is converted into 1-naphthylamine-4-sulphonic acid (naphthionic acid), which, by heating under reflux with sodium bisulphite solution, followed by boiling with 30% caustic soda, is transformed into 1-naphthol-4-sulphonic acid (Neville-Winter acid).

As stated in an earlier section, the position of entry of a sulphonic acid group into the naphthalene molecule is determined by the conditions used. It is very difficult to obtain the pure α-sulphonic acid by direct sulphonation of naphthalene with sulphuric acid on account of the ease with which it is converted into naphthalene-β-sulphonic acid. The latter acid is, however, readily obtained by sulphonation at high temperatures and is an important intermediate. By fusion of the sodium salt with caustic soda, there is formed β-naphthol, and this operation is one of the most important processes in the organic chemical industry. To obtain a good yield and to avoid danger of explosion the caustic soda must be completely free from chlorate. β-Naphthol crystallizes in colourless plates which melt at 122° C. Its methyl ether, nerolin, has a fragrant odour and is used in perfumery. By nitration, followed by reduction, naphthalene-β-sulphonic acid is converted into Cleve's acids, a mixture of 1:6- and 1:7- naphthylaminesulphonic acids, which may be separated by recrystallization of the sodium salts. The salt of the 1:7-acid is less soluble and crystallizes almost completely on the addition of brine.

Sulphonation of β-naphthol leads to 2-naphthol-8-sulphonic acid (Bayer's acid), which is transformed by warm sulphuric acid into 2-naphthol-6-sulphonic acid (Schäffer's acid). With a sufficient excess of sulphuric acid the chief products are 2-naphthol-3:6-disulphonic acid and 2-naphthol-6:8-disulphonic acid, which, because of their property of giving, respectively, red (*rot*) and yellow (*gelb*) colours with diazonium salts, are known, respectively, as R-acid and G-acid. By energetic sulphonation with warm oleum they are both transformed into 2-naphthol-3:6:8-trisulphonic acid. All these acids are important intermediates for azo dyes. The first product of sulphonation of β-naphthol is 2-naphthol-1-sulphonic acid. This, however, is very unstable in presence of excess of sulphuric acid and is rapidly transformed into the 8-sulphonic acid. 2-Naphthol-1-sulphonic acid may, however, be obtained by treatment of naphthalene with chlorosulphonic acid in nitrobenzene solution. By treatment of its sodium salt with ammonia and ammonium sulphite there is obtained the sodium salt of 2-naphthylamine-1-sulphonic acid (Tobias acid).

β-Naphthylamine is another important naphthalene derivative prepared from β-naphthol. The hydroxyl group is replaced by an amino group by means of the Bucherer reaction, whereby β-naphthol is heated in an autoclave at 150° C. and 6 atm. pressure with an ammonium sulphite solution prepared by saturating concentrated ammonia solution with sulphur dioxide and then adding an equal volume of concentrated ammonia solution. β-Naphthylamine crystallizes from alcohol in colourless lustrous scales of melting point 110° C. Unlike the α-isomeride it is odourless when pure. β-Naphthylamine is possibly the agent responsible for causing the bladder cancers to which workers in the dyestuffs industry are sometimes liable. It has been shown experimentally that such bladder tumours can be produced in dogs by administration of β-naphthylamine. The acid sulphate of 1-hydroxy-2-naphthylamine has been isolated from the urine of dogs which were given β-naphthylamine, an example of biochemical hydroxylation of the naphthalene nucleus.

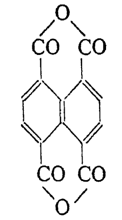
β-Naphthylamine may also be used as the starting point in the preparation of two important aminonaphtholsulphonic acids (γ-acid and J-acid), which may be obtained by various routes from β-naphthol. For instance, β-naphthylamine may be sulphonated to a mixture of the 6:8- and 5:7- disulphonic acids. The nitrite of the former (amino-G-acid) is treated in an autoclave with caustic soda and some water to give, by hydrolysis of the 8-sulphonic acid group, 2:8:6-aminonaphtholsulphonic acid, (γ-acid) (I). By a similar procedure 2-naphthylamine-5:7-disulphonic acid is converted into 2:5:7-aminonaphtholsulphonic acid (J-acid) (II).



I II III

A disulphonic acid of similar type (H-acid) (III) is prepared from naphthalene-2:5:7-trisulphonic acid by nitration, reduction and then displacement of one sulphonic acid group by a hydroxyl. If β-naphthol is treated with sodium nitrite and sulphuric acid it gives 1-nitroso-2-naphthol which, with sodium bisulphite solution, is converted into 1-amino-2-naphthol-4-sulphonic acid. This gives a very stable diazonium salt which may be dried and nitrated without danger. The nitrated product couples with the naphthols to give black dyes. 1-Naphthylamine-4:6:8-trisulphonic acid is an intermediate in the preparation of the drug antrypol (germanin), used in treatment of trypanosomiasis.

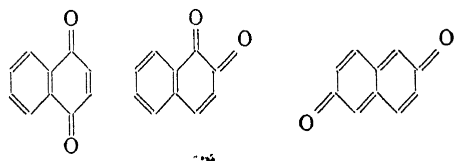
Carboxylic Acids.—Many naphthalenecarboxylic acids have been described, but with few exceptions are of little importance. The monocarboxylic acids, α- and β-naphthoic acids, have been mentioned in an earlier section. They have the usual properties of acids of the aromatic series. Naphthalene-1:8-dicarboxylic acid, naphthalic acid, is obtained by oxidation of the coal tar hydrocarbon, acenaphthene (*q.v.*). In a similar manner, naphthalene-1:4:5:8-tetracarboxylic acid is formed by oxidative degradation of two of the rings of the tetracyclic hydrocarbon, pyrene (*q.v.*). This acid gives a dianhydride (I), which reacts with *o*-phenylene diamine to form a mixture of two isomeric products used as a dyestuff under the name of indanthrene scarlet 2G.



I

Another acid used as a dyestuffs intermediate is 2-hydroxy-3-naphthoic acid, obtained from β-naphthol by the Kolbe-Schmidt reaction.

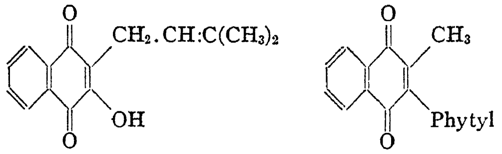
Naphthoquinones.—Six different naphthoquinones, $C_{10}H_6O_2$, are theoretically possible, but the only ones which have been prepared are the 1:4- or α- (I), the 1:2- or β- (II) and the 2:6- or *amphi-* (III) naphthoquinones. 1:4-Naphthoquinone (I) may be obtained by oxidation of naphthalene with chromic acid in acetic acid, but is better prepared by oxidation of 4-amino-1-naphthol. It crystallizes in yellow tablets, melting point 125° C., is volatile in steam and has a characteristic pungent smell. 1:2-



I II III

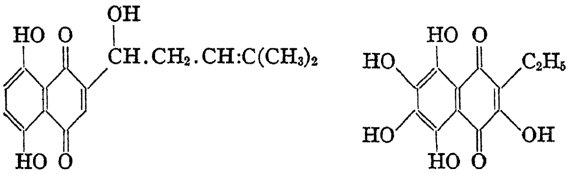
Naphthoquinone, formed by oxidation of 1-amino-2-naphthol, forms golden-yellow needles which decompose at 145° C. to 147° C., and is odourless and nonvolatile. It is somewhat unstable, although more stable derivatives are known; *e.g.*, 3:7-dimethyl-1:2-naphthoquinone. 2:6-Naphthoquinone, also nonvolatile and odourless, forms reddish-yellow crystals. These quinones have the high reactivity associated with quinones of the benzene series, and undergo many reactions of addition. An important example, in the case of the 1:4-quinone, is the Diels-Alder addition of dienes, which furnishes a simple route from the naphthalene series to the anthracene series.

Many derivatives of 1:4-naphthoquinone have been found to occur in nature as pigments. An early known example is juglone, 5-hydroxy-1:4-naphthoquinone, which occurs as the colourless leuco compound in unripe walnut shells. Closely related to this is plumbagin, or 5-hydroxy-2-methyl-1:4-naphthoquinone, a yellow pigment found in roots of *Plumbago* species. It has long been known as the active principle of the medicinal drug, Chita, obtained from this source. Lawsone, extracted from the leaves of henna (*Lawsonia alba*), is 2-hydroxy-1:4-naphthoquinone. Phthiocol, or 2-hydroxy-3-methyl-1:4-naphthoquinone, has been isolated from human tubercle bacilli, but it has been suggested that it may be formed during isolation by degradation of vitamin K. Structurally related to phthiocol is lapachol, a pigment occurring in the grain of a number of African woods (*Bignoniaceae*). Lapachol has been shown to have the structure shown in IV. Introduction of a hydroxyl group into one of the methyl groups of IV gives the structure of lomatiol, the yellow pigment surrounding the nucleus in seeds of Australian *Lomatia*. Vitamin K_1, the antihaemorrhagic factor isolated from hexane extracts of dried alfalfa, is represented by the formula V. The same type of structure has been assigned to vitamin K_2, isolated from decaying fish meal.



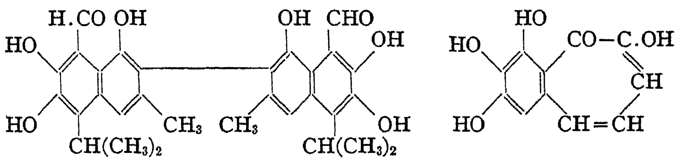
IV V

Another group of natural naphthoquinone pigments is derived from naphthazarin (5:8-dihydroxy-1:4-naphthoquinone), long known as a synthetic dyestuff. To this group belongs alkannin, a brown-red pigment occurring as the angelic ester in the root of *Alkanna tinctoria*. It is optically active (dextrorotatory), and its enantiomorph is shikonin, isolated from *Lithospermum erythrorhizon*. These two pigments have the structure VI. Hydroxydrosérone, which occurs with droserone in *Drosera whittakeri*, a plant growing in the Adelaide district of Australia, is also a naphthazarin derivative (3:5:6-trihydroxy-2-methyl-1:4-naphthoquinone).



VI VII

In many ways the most remarkable of all these substances is echinochrome A, one of several related pigments which have been isolated from sea urchin eggs. It functions as a chemotactic principle and is secreted by the egg to the surrounding sea water to induce motility in spermatozoa with which it comes in contact. It still shows biological activity in dilutions of 1.2×10^9. It is a completely substituted naphthalene derivative of the structure VII, or a tautomeride. Dunnione, from *Streptocarpus dunnii* Mast., is a pigment which has been characterized as an *ortho*-quinone, and is probably derived from 1:2-naphthoquinone. Another natural product derived from naphthalene, although not a quinonoid pigment, is gossypol, the yellow toxic principle of cottonseed. On the basis of an extensive series of degradations Roger Adams assigned to gossypol the structure VIII.

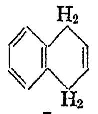


VIII IX

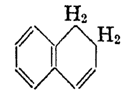
Yet another natural pigment related to naphthalene is purpurogallin, which occurs as glucosides in many galls. It gives naphthalene on distillation with zinc dust. This is the result of a rearrangement of a seven-membered ring, for R. D. Haworth showed that purpurogallin has the structure IX. Concentrated caustic potash converts it into purpurogallone, which is 6:7:8-trihydroxy-1-naphthoic acid.

Hydrogenated Naphthalenes.—As already stated, naphthalene is reduced by sodium and ethyl alcohol to the 1:4-dihydride

(I), and by sodium and amyl alcohol to the tetrahydride (tetralin). The 1:4-dihydride is also formed by hydrolysis of the compound obtained by addition of lithium to naphthalene which is, therefore, the 1:4-dilithium compound. 1:4-Dihydronaphthalene is best purified through its crystalline addition compound with mercuric acetate. When heated with sodium ethoxide in ethanol at 100° C. –105° C., 1:4-dihydronaphthalene is isomerized to 1:2-dihydronaphthalene (II), in which the ethylenic bond is conjugated with the residual benzene ring. The 1:2- and the 1:4-compounds are the only known dihydrides of naphthalene. They are distinguished from one another by their physical constants and their absorption spectra, and their structures are demonstrated by the products which they give on oxidation. The 1:4-dihydride gives *o*-phenylenediacetic acid, whereas the 1:2-dihydride gives *o*-carboxyphenylpropionic acid.

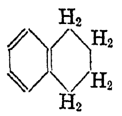


I

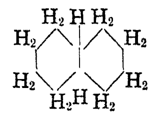


II

The catalytic hydrogenation of naphthalene is a process of technical importance. By hydrogenation over finely divided nickel at high temperatures, naphthalene readily gives first tetrahydronaphthalene (tetralin) (III) and then decahydronaphthalene (decalin) (IV). The naphthalene must be carefully purified before use, in order to free it from sulphur compounds which poison the catalyst. Both tetralin and decalin are valuable solvents. Many of their derivatives are also known. They are obtained by chemical or catalytic reduction of appropriate naphthalene derivatives, or from simpler compounds by synthetic reactions.



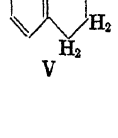
III



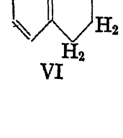
IV

The course of reduction or hydrogenation of substituted naphthalenes depends on a number of factors, and the nature of the product is often influenced by the method used. α-Naphthol and α-naphthylamine are reduced by sodium and amyl alcohol in the unsubstituted ring giving, respectively, a phenol and an aromatic amine derived from tetralin. On the other hand, β-naphthol and β-naphthylamine are attacked mainly in the ring to which the substituent is attached and give as predominant products a hydroxy tetralin and an amino tetralin which have the character of an alcohol and an alicyclic primary amine, respectively. When β-naphthylamine is hydrogenated over a nickel catalyst the unsubstituted ring is mainly attacked, the chief product being the aromatic β-amino tetralin.

Oxidation of tetralin takes place by attack on the alicyclic ring, and in the α-position. Cold chromic acid gives α-tetralone (V), which may be synthesized by cyclisation of γ-phenylbutyric acid. The same ketone is doubtless an intermediate in the permanganate oxidation of tetralin to *o*-carboxyphenylpropionic acid and phthalonic acid. α-Tetralone is also formed when a slow stream of air or oxygen is passed through tetralin at 70° C., in the presence of iron phthalocyanine. This oxidation probably takes place through the intermediary of tetralin α-hydroperoxide (VI), which is formed in high yield by auto-oxidation of tetralin. The presence of the peroxide may cause distillation residues from tetralin to explode, and the use of antioxidants to inhibit the auto-oxidation has been suggested.

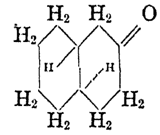


V

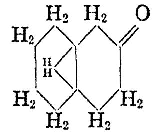


VI

W. Hückel's investigations on decalin derivatives are of fundamental importance in connection with the stereochemistry of fused-ring systems, and provide experimental verification of the theory of H. Sachse and E. Mohr that alicyclic compounds containing more than five carbon atoms in the ring have strainless multiplanar configurations (*see* STEREOCHEMISTRY). Thus, by hydrogenation of β-naphthol under various conditions, four different decahydro-compounds are formed, melting at 75°, 53°, 105° and 18° C., respectively. The first two of these are oxidized to the same ketone (trans-β-decalone), and the difference between them clearly resides in the configuration of the hydroxyl groups; they are, in fact, epimerides. The second pair of carbinols are both oxidized to a ketone (*cis*-β-decalone), which differs from the first-named ketone. The two ketones are stereoisomeric, and differ in the configurations of the rings about the carbon atoms which are common to both rings. In the case of the *trans*-ketone, the hydrogen atoms attached to these two carbon atoms lie on opposite sides of the ring system, and in the *cis*-ketone they are on the same side. The configurations of the two ketones may be represented by the expressions VII and VIII, which denote *trans*- and *cis*- forms, respectively.



VII



VIII

The configurations have been deduced by further oxidation to stereoisomeric *cyclo*hexane-1:2-diacetic acids, only one of which is resolvable into optically active forms. This must have the *trans*- configuration. If the two β-decalones are reduced by E. Clemmensen's method they are converted into isomeric *trans*- and *cis*-decalins, which differ in their physical constants. It has been shown, further, that the decalin formed by catalytic hydrogenation of naphthalene is a mixture of these two stereoisomerides. Hydrogenation at low temperatures (with Adams' platinum oxide catalyst in acetic acid solution) favours the formation of *cis*-decalin, whereas at high temperatures (with a nickel catalyst) the *trans* hydrocarbon is mainly formed. *cis*-Decalin is almost entirely converted into *trans*-decalin by treatment with anhydrous aluminum chloride at room temperature. The hydrogenation of α-naphthol has also been shown to give rise to four stereoisomeric alcohols, two of which are oxidized to *trans*-α-decalone and the other to *cis*-α-decalone. *cis*-α-Decalone is isomerized by heat, or by acid or alkali, to the *trans*-ketone. This rearrangement must involve the formation of an enolic form common to both ketones.

NAPHTHYLAMINES: *see* NAPHTHALENE.

NAPIER, SIR CHARLES (1786–1860), British admiral, second son of the Hon. Charles Napier, R.N., and grandson of the 5th Lord Napier, was born at Merchiston hall, near Falkirk, on March 6, 1786. He became a midshipman in 1800 and lieutenant in 1805. He was appointed to the "Courageux" (74), serving with her in the West Indies, and later was appointed commander of the "Pultusk" brig (Nov. 30, 1807). In Aug. 1808 he was moved into the "Recruit," and in April 1809 took part in the capture of the "Hautpoult" and was promoted acting post captain. Coming home with a convoy, he was put on half pay and spent some time at the University of Edinburgh, and later visited Portugal. He served in 1811 in the Mediterranean and in 1813 on the coast of America. He spent his leisure in Italy and Paris, but was ruined by speculation in a steamboat company. In 1827 he was appointed to the "Galatea," was at the Azores when they were held by the count de Villa Flor for the queen of Portugal, and accepted the offer of the constitutional leaders to take command of the fleet (Feb. 1833). With it he destroyed

the Miguelite fleet on July 5, and was struck off the English navy list. He commanded the Portuguese land forces in the defence of Lisbon (1834) and was made Count Cape St. Vincent in the peerage of Portugal.

Napier then returned to England, was restored to his former rank in 1836, and received the command of the "Powerful" in 1838. In 1840 he was made K.C.B. for his services as second in command in Syria. He was M.P. for Marylebone from 1842–46. He was promoted rear-admiral in 1846 and commanded the Channel fleet from 1846–48. In the Russian War he received the command of the Baltic fleet, and hoisted his flag in February 1854. He refused to attack Cronstadt, and a great outcry was raised against him for not obeying the orders of the Admiralty. He was not again offered a command. He was M.P. for Southwark from February 1855 until his death on Nov. 6, 1860.

See Major-General E. Napier's *Life and Correspondence of Admiral Sir Charles Napier, K.C.B.* (2 vols., 1862); Napier's own *War in Syria* (2 vols., 1842); *The Navy: its past and present state, in a series of letters,* edited by Sir W. F. P. Napier (1851); and *The History of the Baltic Campaign of 1854, from documents and other materials furnished by Vice-Admiral Sir C. Napier, K.C.B.* (1857). *See* also *The Life and Exploits of Commodore Napier* (1841); and *Life of Vice-Admiral Sir C. Napier* (1854).

NAPIER, SIR CHARLES JAMES (1782–1853), British soldier and statesman, was born in London, the eldest son of Colonel George Napier (a son of the 5th Lord Napier) and Lady Sarah Lennox, on Aug. 10, 1782. He was lieutenant in 1800 and captain in the staff corps under Sir John Moore. He became major in 1806 and served in the Danish campaign (1807) and in Portugal, but was badly wounded at Coa and Busaco. He took part in the pursuit of Masséna and became lieutenant-colonel (1811) of the 102nd regiment, which he thoroughly reorganized. At Bermuda in 1813 he served against the United States, but returned in 1815 and was made C.B. From 1822 to 1830 he was military resident of Cephalonia, where he met Lord Byron, and was recommended as commander-in-chief of the Greek forces. Napier declined, and, after trouble with Sir Frederick Adams, the high commissioner, he became commanding officer in the north of England during the Chartist riots (1839), although his sympathies were on the popular side. He accepted an Indian commission in 1841, and in September 1842 was ordered to Sind.

His command in Sind lasted until August 1847. He at once determined to seek the first opportunity of conquering the amirs. He was to be accompanied by James Outram (*q.v.*) who had been British resident in Sind during the Afghan War. On Feb. 15, 1843, Outram was treacherously assailed at Hyderabad, and on the 17th Napier attacked the Baluch army 30,000 strong, with but 2,800 men. With these 2,800 men, including the 22nd regiment, he won the brilliant and decisive victory of Miani, one of the most amazing in the history of the British army, in which generals had to fight like privates. In March he finally destroyed the army of the amirs at the battle of Hyderabad, and for this service received the K.C.B. Sind, when it came under British rule, was in a state of anarchy, for the Baluchis had formed a tyrannical military government. The native population was protected by Sir Charles Napier. The difficulties of administration were increased by the necessity of repressing the hill tribes, encouraged to lawless acts by the licence which followed the Afghan War; the later years were made very stormy by attacks in England on the policy of the conquest. Napier left Sind in August 1847 after quarreling with nearly every authority in India. His short stay in England was occupied with incessant struggles with the directors of the East India Company, but the panic in England which followed the news of the indecisive victory of Chillianwalla obliged the company to summon the greatest general of the day to command its armies.

Napier left for India at once, only to find that the victory of Gujrat had been won and the Sikh War was over. He was on good terms with the governor-general, Lord Dalhousie, until, in Dalhousie's absence at sea, Napier took upon himself, in face of a threat of mutiny, to alter the regulations regarding allowances to native troops. On Dalhousie's return he reprimanded the commander-in-chief, and reversed his decision. Napier immediately resigned, and, when Wellington repeated the reprimand, he returned to England.

He has been credited with foreseeing the Mutiny of 1857, and on the whole with justice. On one occasion he wrote that mutiny was "one of the greatest, if not the greatest, danger threatening India—a danger that may come unexpectedly, and if the first symptoms be not carefully treated, with a power to shake Leadenhall." On the mutiny of the 66th native regiment at Govindgarh he disbanded it, and handed its colours over to a Gurkha regiment, thus showing that he distrusted the high-class Brahman, and recognized the necessity of relying upon a more warlike and more disciplined race. His constitution was undermined by the Indian climate, and he died at Portsmouth on Aug. 29, 1853. The bronze statue of him by G. G. Adams, which stands in Trafalgar Square, London, was erected by public subscription, by far the greater number of the subscribers being, as the inscription records, private soldiers.

The chief authority for Sir Charles Napier's life is his *Life and Opinions* by his brother (1857); consult also MacColl, *Career and Character of C. J. Napier* (1857); M'Dougall, *General Sir C. J. Napier, Conqueror and Governor of Scinde* (1860); W. N. Bruce, *Sir Charles Napier* (1855); and T. R. E. Holmes, *Four Famous Soldiers* (1889). His own works are *Memoir on the Roads of Cephalonia* (1825); *The Colonies, treating of their value generally and of the Ionian Islands in particular; Strictures on the Administration of Sir F. Adam* (1833); *Colonization, particularly in Southern Australia* (1835); *Remarks on Military Law and the Punishment of Flogging* (1837); *A Dialogue on the Poor Laws* (1838?); *A Letter on the Defence of England by Corps of Volunteers and Militia* (1852); *Lights and Shadows of Military Life* (trans. from the French, 1840); and *A Letter to the Right Honourable Sir J. C. Hobhouse on the Baggage of the Indian Army* (1849); *Defects, Civil and Military, of the Indian Government* (1853); *William the Conqueror, a Historical Romance,* edited by Sir W. Napier (1858). On Sind, consult primarily Sir W. Napier, *The Conquest of Scinde* (1845); *The Administration of Scinde* (1851); *Compilation of General Orders issued by Sir C. Napier* (1850); and Outram, *The Conquest of Scinde, a Commentary* (1846). For his command-in-chief, and the controversy about his resignation, consult J. Mawson, *Records of the Indian Command of General Sir C. J. Napier* (Calcutta, 1851); *Minutes on the Resignation of the late General Sir C. Napier, by Field-Marshal the Duke of Wellington,* etc. (1854); *Comments by Sir W. Napier on a Memorandum of the Duke of Wellington* (1854); Sir William Napier, *General Sir C. Napier and the Directors of the East India Company* (1857); Sir W. Lee Warner, *Life of Lord Dalhousie* (1904).

NAPIER, JOHN (1550–1617), Scottish mathematician, the inventor of logarithms, was born in Merchiston near Edinburgh in 1550, and was the eighth Napier of Merchiston. He matriculated at St. Salvator's college, St. Andrews, in 1563. Very little is known of his life at this time, but it is plain from the "Discourse" which he prefixed to his *Plaine Discovery* that he was already a devoted adherent of the Protestant cause. From St. Andrews he went apparently to study in Paris, and travelled in Italy and Germany. But he was back at Merchiston in 1571, and in the next year married Elizabeth, daughter of Sir James Stirling. The son of this marriage was Archibald, Lord Napier. Elizabeth Napier died in 1579, and soon after Napier married Agnes Chisholm.

Napier was one of the Edinburgh commissioners to the General Assembly in 1588, and on Oct. 17, 1593, was a member of a committee nominated by a convention of delegates to make representations to the king at Jedburgh on the safety of the Church and the punishment of the Roman Catholic earls. He was a member of a similar delegation later in the month. On Jan. 29, 1594, Napier addressed to the king the letter which forms the dedication of his *Plaine Discovery of the whole Revelation of Saint John: set down in two treatises . . .* (Edinburgh, 1593). This book has a great place in the history of theology in Scotland, for it is the first important Scottish work on the interpretation of scripture.

After the publication of the *Plaine Discovery,* Napier seems to have occupied himself with the invention of secret instruments of war, for in the Bacon collection at Lambeth Palace there is a document, dated June 7, 1596, and signed by Napier, giving a list of his inventions for the defence of the country against the anticipated invasion by Philip of Spain. In 1614 appeared *Canonis Descriptio* embodying his invention of logarithms. Their nature is explained by reference to the motion of points in a straight line, and the principle upon which they are based is that of the correspondence of a geometrical and an arithmetical series of numbers.

The table gives the logarithms of sines for every minute to seven figures. This work contains the first announcement of logarithms to the world, the first table of logarithms and the first use of the name logarithm, which was invented by Napier.

In 1617 Napier published his *Rabdologia.* The method which Napier terms "Rabdologia" consists in the use of certain numerating rods for the performance of multiplications and divisions. These rods were commonly called "Napier's bones" The second method, which he calls the "Promptuarium Multiplicationis," involves the use of a number of lamellae or little plates of metal disposed in a box. In an appendix he gives his third method, "local arithmetic," which is performed on a chess-board, and depends, in principle, on the expression of numbers in the scale of radix 2. In the *Rabdologia* he gives the chronological order of his inventions.

John Napier died on April 4, 1617, the same year as that in which the *Rabdologia* was published.

The *Canonis Descriptio* on its publication in 1614 at once attracted the attention of Edward Wright, whose name is known in connection with improvements in navigation, and Henry Briggs, then professor of geometry at Gresham college, London. The former translated the work into English, but he died in 1615, and the translation was published by his son Samuel Wright in 1616. The logarithms introduced by Napier in the *Descriptio* are not the same as those now in common use, nor even the same as those now called Napierian or hyperbolic logarithms. The change from the original logarithms to common or decimal logarithms was made by both Napier and Briggs, and the first tables of decimal logarithms were calculated by Briggs, who published a small table, extending to 1,000, in 1617, and a large work, *Arithmetica Logarithmica*, containing logarithms of numbers to 30,000 and from 90,000 to 100,000, in 1624. (*See* LOGARITHMS.) Napier's *Descriptio* of 1614 contains no explanation of the manner in which he had calculated his table. This account he kept back, as he himself states, in order to see from the reception met with by the *Descriptio* whether it would be acceptable. Though written before the *Descriptio* it had not been prepared for press at the time of his death, but was published by his son Robert in 1619 under the title *Mirifici Logarithmorum Canonis Constructio.* In this treatise (which was written before Napier had invented the name logarithm) logarithms are called "artificial numbers."

Napier's priority in the publication of the logarithms is unquestioned and only one other contemporary mathematician seems to have conceived the idea on which they depend.

An account of the contents of the manuscripts of John Napier in the possession of the family which survived a disastrous fire at the end of the 18th century was given by Mark Napier in the appendix to his *Memoirs of John Napier*, and the manuscripts themselves were edited in their entirety by him in 1839 under the title *De Arte Logistica Joannis Naperi Merchistonii Baronis Libri qui supersunt. Impressum Edinburgi* M.DCCC.XXX.IX., as one of the publications of the Bannatyne club. The *Arithmetica* consists of three books, entitled: (1) De Computationibus Quantitatum omnibus Logisticae speciebus communium; (2) De Logistica Arithmetica; (3) De Logistica Geometrica. At the end of this book occurs the note—"I could find no more of this geometricall pairt among all his fragments." The *Algebra Joannis Naperi Merchistonii Baronis* consists of two books: (1) "De nominata Algebrae parte; (2) De positiva sive cossica Algebrae parte," and concludes with the words, "There is no more of his algebra orderlie sett doun."

Besides the logarithms and the calculating rods or bones, Napier's name is attached to certain rules and formulae in spherical trigonometry. To him also seems to be due the first use of the decimal point in arithmetic. Decimal fractions were first introduced by Stevinus in his tract *La Disme*, published in 1585, but he used cumbrous exponents (numbers enclosed in circles) to distinguish the different denominations, primes, seconds, thirds, etc. In the *Rabdologia* Napier gives an "Admonitio pro Decimali Arithmetica," in which he commends the fractions of Stevinus and gives an example of their use, the division of 861094 by 432. The quotient is written 1993,273 in the work and $1993{,}2'7''3'''$ in the text. The decimal point is, however, used systematically in the *Constructio* (1619), there being perhaps two hundred decimal points altogether in the book.

Napier was in possession of all the conventions and attributes that enable the decimal point to complete so symmetrically our system of notation, viz. (1) he saw that a point or separatrix was quite enough to separate integers from decimals, and that no signs to indicate primes, seconds, etc., were required; (2) he used ciphers after the decimal point and preceding the first significant figure; and (3) he had no objection to a decimal standing by itself without any integer. Napier thus had complete command over decimal fractions and the use of the decimal point.

The bibliography of Napier's work attached to W. R. Macdonald's translation of the *Canonis Constructio* (1889) is complete and valuable. Napier's three mathematical works are reprinted by N. L. W. A. Gravelaar in *Verhandelingen der Kon. Akad. van Wet te Amsterdam* (1899).

NAPIER, SIR WILLIAM FRANCIS PATRICK (1785–1860), British soldier and military historian, third son of Colonel George Napier (1751–1804), was born at Celbridge, near Dublin, on Dec. 17, 1785. He became an ensign in the Royal Irish Artillery in 1800, but at once exchanged into the 62nd, and was put on half-pay in 1802. He afterwards became a cornet in the Blues, but he soon exchanged into the 52nd, which was about to be trained at Shorncliffe. Through Sir John Moore he soon obtained a company in the 43rd, joined that regiment at Shorncliffe and became a favourite with Moore. He served in Denmark, and was present at the engagement of Kioge, and, shortly afterwards bore himself nobly through the retreat to Corunna. In 1809 he became aide-de-camp to the duke of Richmond, lord lieutenant of Ireland, but joined the 43rd when that regiment was ordered again to Spain. With the light brigade (the 43rd, 52nd, and 95th), under the command of General Craufurd, he marched to Talavera and had an attack of pleurisy on the way. He refused to leave Spain, was wounded on the Coa, and shot near the spine at Cazal Nova. After he left the lines of Torres Vedras he became brigade major, was present at Fuentes d'Onor, but had an attack of ague and was obliged to return to England. He married Caroline Amelia Fox, daughter of General Henry Fox. Three weeks afterwards he again started for Spain, and was present at the storming of Badajoz, where his great friend Colonel M'Leod was killed. He took command of the 43rd regiment (he was now a substantive major) and commanded it at the battle of Salamanca. At the battle of the Nivelle he secured the most strongly fortified part of Soult's position, practically without orders. He served with his regiment at the battles of the Nive, where he was wounded, Orthes, and Toulouse. For his services he was made brevet lieutenant-colonel, and one of the first C.B.'s. He then entered the military college at Farnham. He commanded his regiment in the invasion of France after Waterloo, and remained in France with the army of occupation until 1819, when he retired on half-pay. As this was not enough for him to live on with a wife and family, he studied with George Jones, the academician to become an artist.

His career was to be great in literature, not in art. The tendency appeared in a review of Jomini's works (*Edinburgh Rev.*) in 1821, and in 1823 Bickersteth (afterwards Lord Langdale) suggested to him writing a history of the Peninsular War. The duke of Wellington gave him much assistance, and handed over to him the whole of Joseph Bonaparte's correspondence which had been taken at the battle of Vittoria; this was all in cipher, but Mrs. Napier, with great patience, discovered the keys. Marshal Soult also took an active interest in the work and arranged for the French translation of Mathieu Dumas. In 1828 the first volume of the *History* appeared. The publisher, John Murray, was disappointed in the sale of the first volume and Napier published the remainder himself. But the excitement which followed the appearance of each volume is proved by the innumerable pamphlets issued by those who believed themselves to be attacked, and by personal altercations with many distinguished officers. This success was due to a combination of qualities which have justly secured for Napier the title of being the greatest military historian England has produced. When in 1840 the last volume of the

History was published, his fame was safely established.

His life during these years had been chiefly absorbed in his *History,* but he had warmly sympathized with the movement for political reform which was agitating England. The Radicals of Bath and many other cities and towns pressed him to enter parliament, and Napier was invited to become the military chief of a national guard to obtain reforms by force of arms. He refused the dangerous honour on the ground that he was in bad health and had a family of eight children. In 1830 he had been promoted colonel, and in 1842 he was made a major-general and given the lieutenant-governorship of Guernsey. Here he managed the relations between the soldiers and the inhabitants, and worked out proposals for a complete scheme of reform in the government of the island.

In 1845 he published his *History of the Conquest of Scinde,* and in 1851 the corresponding *History of the Administration of Scinde.* In 1847 he resigned his governorship, and in 1848 was made a K.C.B., and settled at Scinde House, Clapham Park. In 1851 he was promoted lieutenant-general. His time was occupied in defending his brother, and in revising the numerous editions of his *History* which were being called for. His energy is the more astonishing when it is remembered that he never recovered from the effects of the wound he had received at Cazal Nova, and that he often had to lie on his back for months together. His domestic life was shadowed by the incurable affliction of his only son. He devoted himself to writing the life of his brother Charles, which appeared in 1857. He died on Feb. 12, 1860. Four months earlier he had been promoted to the full rank of general.

His brother, SIR GEORGE THOMAS NAPIER (1784–1855), entered the army in 1800, and served with distinction under Moore and Wellington in the Peninsula. He became major-general in 1837, K.C.B. in 1838 and lieutenant-general in 1846. He was governor and commander-in-chief at the Cape from 1839 to 1843. He was offered, but declined, the chief command in India after Chillianwalla, and also that of the Sardinian army in 1849. He became full general in 1854. He died at Geneva on Sept. 16, 1855. His autobiography, *Passages in the Early Military Life of General Sir G. T. Napier,* was published by his son, General W. C. E. Napier in 1885.

The youngest brother, HENRY EDWARD NAPIER (1789–1853), served in the navy during the Napoleonic wars, retired as a captain, and wrote a learned *Florentine History from the earliest authentic Records to the Accession of Ferdinand III. of Tuscany* (1846–1847).

For Sir William Napier's life, *see* his *Life and Letters,* edited by H. A. Bruce (Lord Aberdare) (1862).

NAPIER AND ETTRICK, FRANCIS NAPIER, Baron (1819–1898), British diplomatist, descended from the ancient Scottish family of Napier of Merchistoun, was born on Sept. 15, 1819, the son of William John, ninth Lord Napier. He entered the diplomatic service in 1840, and held successive posts at Vienna, Constantinople, Naples, Washington and The Hague. In 1860 he became ambassador at St. Petersburg, and in 1864 at Berlin. In 1866 he was appointed governor of Madras, and was at once confronted with a serious famine in the northern districts. In dealing with this and other problems he showed great activity and practical sense, and he encouraged public works, particularly irrigation. In 1872 he acted for a few months as Viceroy, after Lord Mayo's assassination; and on Lord Northbrook's appointment to the office he returned to England, being created a baron of the United Kingdom (Baron Ettrick of Ettrick) for his services. He was for a time a member of the London School Board, and was chairman of the Crofters' Commission in 1883, the result of which was the appointment of a permanent body to deal with questions affecting the Scottish crofters and cottars. He died at Florence on Dec. 19, 1898.

NAPIER OF MAGDALA, ROBERT CORNELIS NAPIER, 1ST BARON (1810–1890), British field-marshal, son of Major Charles Frederick Napier, was born at Colombo, Ceylon, on Dec. 6, 1810. He entered the Bengal Engineers from Addiscombe College in 1826, and after the usual course of instruction at Chatham, arrived in India in November 1828. For some years he was employed in the irrigation branch of the public works department, and in 1838 he laid out the new hill station at Darjeeling. Promoted captain in January 1841, he was appointed to Sirhind, where he laid out cantonments on a new principle—known as the Napier system—for the troops returning from Afghanistan. In December 1845 he joined the army of the Sutlej, and commanded the Engineers at the battle of Mudki, where he had a horse shot under him. At the battle of Ferozeshah on Dec. 21 he again had his horse shot under him and, joining the 31st regiment on foot, was severely wounded in storming the entrenched Sikh camp. He was present at the battle of Sobraon on Feb. 10, 1846, and in the advance to Lahore. He was chief engineer at the reduction of Kote-Kangra by Brigadier General Wheeler in May 1846 and received the thanks of the government. He was then appointed consulting engineer to the Punjab resident and council of regency, but was again called to the field to direct the siege of Multan. He was wounded in the attack on the entrenched position in Sept. 1848, but was present at the action of Surjkund, the capture of the suburbs, the successful storm of Multan on Jan. 23, 1849, and the surrender of the fort of Chiniot. He then joined Lord Gough, took part, as commanding engineer of the right wing, in the battle of Gujrat in Feb. 1849, accompanied Sir W. R. Gilbert in his pursuit of the Sikhs and Afghans and was present at the passage of the Jhelum, the surrender of the Sikh army and the surprise of Attock. At the close of the war Napier was appointed civil engineer to the board of administration of the annexed Punjab province and carried out many important public works. He commanded a column in the first Hazara expedition in Dec. 1852 and against the Boris in the following year. He was appointed military secretary and adjutant general to Sir James Outram's force for the relief of Lucknow in the Indian mutiny in 1857 and was engaged in the actions which culminated in the first relief of Lucknow. He directed the defense of Lucknow until the second relief, when he was severely wounded in crossing an open space with Outram and Havelock to meet Colin Campbell. He was chief of the staff to Outram in the defense of the Alambagh position and drew up the plan of operations for the attack on Lucknow, which was approved by Campbell and carried out by Napier, as brigadier general commanding the engineers, in March 1858. On the fall of Lucknow Napier was appointed C.B. He joined Sir Hugh Rose as second-in-command in his march on Gwalior, and commanded the 2nd brigade at the action of Morar on June 16. On the fall of Gwalior he was entrusted with the task of pursuing the enemy. With only 700 men he came up with Tantia Topi and 12,000 men on the plains of Jaora Alipur and completely defeated him, capturing all his guns (25), ammunition and baggage. On Rose's departure he took command of the Gwalior division, captured Paori in August, routed Ferozeshah, a prince of the house of Delhi, at Ranode in December, and in January 1859, succeeded in securing the surrender of Man Singh and Tantia Topi, which ended the war. For his services Napier received the thanks of parliament and of the Indian government, and was made K.C.B.

In January 1860 Napier was appointed to the command of the 2nd division of the expedition to China under Sir Hope Grant, and took part in the action of Sinho, the storm of the Peiho forts, and the entry to Peking. For the next four years Napier was military member of the council of the governor-general of India and, on the sudden death of Lord Elgin, for a short time acted as governor-general, until the arrival of Sir W. T. Denison from Madras. In January 1865 he was given the command of the Bombay army; in March 1867 he was promoted lieutenant-general, and, later in that year, appointed to command the expedition to Abyssinia, selecting his own troops and making all the preparations for the campaign. He arrived at Annesley Bay in the Red Sea in January 1868, reached Magdala, 420 m. from the coast, in April; stormed the stronghold, freed the captives, razed the place to the ground, returned to the coast, and on the 18th June the last man of the expedition had left Africa. He received for his services the thanks of parliament, a pension, a peerage, the G.C.B., the G.C.S.I., and many academic honors. He held the command-in-chief in India for six years from 1870, during which

he did much to benefit the army. He was promoted general in 1874, and appointed a colonel-commandant of the royal engineers. In 1876 he was the guest of the German crown prince at the military manoeuvres; and from that year until 1883 he held the government and command of Gibraltar. In the critical state of affairs in 1877 he was nominated commander in chief of the force which it was proposed to send to Constantinople. On Jan. 1, 1883, he was promoted to be field marshal. In Dec. 1886 he was appointed constable of the Tower of London. He died in London on Jan. 14, 1890.

See H. D. Napier, *Field Marshal Lord Napier of Magdala* (London, 1927).

NAPIER, a seaport of New Zealand, on the east coast of North Island, capital of the provincial district of Hawke's Bay, 200 mi. N.E. of Wellington. Pop. (1945) 17,243 (20,297 with suburbs). The town is on a picturesque peninsula known as Scinde Island. The harbour (Port Ahuriri) is sheltered by a breakwater. Much of the town was destroyed by a severe earthquake in 1931 in which 255 persons lost their lives. The entire business section of the town was rebuilt and Napier became a modern, well-planned and attractive small city. It is the seat of the Anglican bishop of Waiapu The district is agricultural, and wool, frozen meats and fruits are exported.

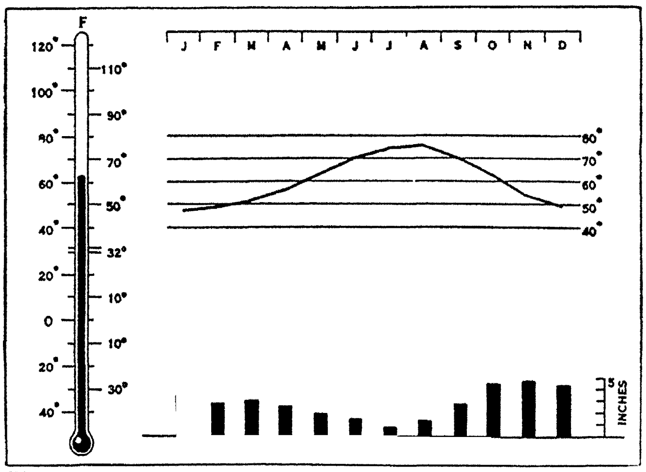
NAPLES (Ital. *Napoli,* and Lat. *Neapolis*), formerly the capital of the kingdom of the Two Sicilies, and since 1860 the chief town of the province which bears its name. It was the largest city in the country in 1901, containing 547,503 inhabitants, but was later outstripped by Milan. Its population in 1936 was 739,349 (town), 865,913 (commune). It is the see of a cardinal archbishop; the residence of the general commanding the X Army corps and of the admiral commanding the second Naval department of Italy; and it possesses also an ancient and important university. In World War II it was heavily bombed by U.S. and British air forces, some 30 times from Nov. 1942–July 1943 alone. It was occupied by U.S. and British forces in Oct. 1943.

Naples disputes with Istanbul the claim of occupying the most beautiful site in Europe. It is situated on the northern shore of the Bay of Naples (*Sinus Cumanus*), in 40° 52′ N., 14° 15′ 45″ E., as taken from the lighthouse on the mole. By rail it is distant 135 mi. from Rome, by the direct line, and 155 by the older line via Cassino. The circuit of the bay is about 35 mi. from the capo di Miseno on the northwest to the Punta della Campanella on the southeast, or more than 52 mi. if the islands of Ischia, at the northwest, and of Capri, at the south entrance, be included. At its opening between these two islands it is 14 mi. broad; while another 4 mi. separates Capri from the mainland at the Punta della Campanella, and from the opening to its head at Portici the distance is 15 mi. It affords good anchorage, with nearly 7 fathoms of water, and is well sheltered, except from winds which blow from points between southeast and southwest.

On the north-east shore east of Naples is an extensive flat, forming part of the ancient *Campania Felix,* and watered by the small stream Sebeto and by the Sarno, which last, in classical times, formed the port of Pompeii. From this flat, between the sea and the range of the Apennines, rises Mt. Vesuvius, at the base of which, on or near the sea-shore, are populous villages as well as the classic sites of Herculaneum and Pompeii. At the south-east extremity of the plain, 3 m. beyond the outlet of the Sarno, a great offshoot of the Apennines, branching from the main range near Cava, and projecting as a peninsula more than 12 m. W., divides the Bay of Naples from the Bay of Salerno (*Sinus Paestanus*), and ends in the bold promontory of the Punta della Campanella (Promontorium Minervae), which is separated by a strait of 4 m. from Capri. On the north slope of this peninsula, where the plain ends and the coast abruptly bends to the west, stands the town of Castellammare di Stabia, at the foot of Mt. Sant' Angelo, which rises to a height of 4,734 ft.

The north-west shore to the west of Naples is more broken and irregular. The promontory of Posilipo, which projects due south, divides this part of the bay into two smaller bays—the eastern, with the city of Naples, and the western, or Bay of Baiae, which is sheltered from all winds. A tunnel through the promontory, 2,244 ft. long, 21 ft. broad, and in some places as much as 70 ft. high, possibly constructed by Marcus Agrippa in 27 B.C., forms the so-called grotto of Posilipo; at the Naples end stands the reputed tomb of Virgil, which has recently been restored. Beyond Posilipo is the small island of Nisida (*Nesis*); and at a short distance inland are the extinct craters of Solfatara and Astroni and the lake of Agnano. Farther west, on the coast, and provided with a convenient harbour, stands Pozzuoli (*Puteoli*), containing many Roman remains, and beyond it, round the Bay of Baiae, are Monte Nuovo, a hill thrown up in a single night in Sept. 1538; the classic site of Baiae; the Lucrine lake; Lake Avernus; the Lake of Fusaro (*Acherusia Palus*); and the port and promontory of Misenum. Still farther to the south-west lie the islands of Procida (*Prochyta*) and Ischia (*Pithecusa, Aenaria* or *Inarime*), which divide the Bay of Naples from the extensive Bay of Gaeta. All this country was comprised in classical times under the title of the *Phlegrean Fields,* and was certainly then more actively volcanic than it now is, although the severe shock of earthquake which occurred in the island of Ischia in 1883, completely destroyed Casamicciola, and did serious damage to Forio, Lacco Ameno and Serrara Fontana, shows that there is great seismic activity in the locality. The whole region abounds with fissures, from which steam highly charged with hydrochloric acid is continually issuing, and in many places boiling water is found at a very few feet below the surface.

The city of Naples is built at the base and on the slopes of a range of volcanic hills, and, rising from the shore like a theatre, is seen to best advantage from the sea. From the summit occupied by the castle of St. Elmo a transverse ridge runs south to form the promontory of Pizzofalcone, and divides the city into two natural crescents. The western crescent, known as the Chiaja ward, though merely a long narrow strip between the sea and Vomero hill, is the fashionable quarter most frequented by foreign residents and visitors. A fine broad street, the Riviera di Chiaja, was begun at the close of the 16th century by Count d'Olivares, and completed by the duke de Medina Celi (1695–1700), running for a mile and a half from east to west, ending



WEATHER GRAPH OF NAPLES. THE MERCURY INDICATES THE NORMAL MEAN TEMPERATURE. THE CURVE SHOWS THE NORMAL MONTHLY MEAN TEMPERATURE. THE COLUMNS INDICATE THE NORMAL MONTHLY PRECIPITATION

in the quarter of Mergellina and Piedigrotta, at the foot of the hill of Posilipo. In front lie the public gardens of the Villa Nazionale, the chief promenade of the city, which were first laid out in 1780, and have been successively extended in 1807, in 1834, and again in recent years; and the whole edge of the bay from the Castel dell' Ovo to Mergellina is lined by a massive embankment and carriage-way, the Via Caracciolo, constructed in 1875–81. The eastern crescent includes by far the largest, as well as the oldest, portion of Naples.

The best known thoroughfare is the historic Toledo (officially Via Roma), which runs almost due north from the Piazza del Plebiscito in front of the Palazzo Reale, till, as Via Nuova di Capodimonte, crossing the Ponte della Sanità (constructed by

Murat across the valley between Santa Teresa and Capodimonte), it reaches the gates of the Capodimonte palace, thus dividing the city into two parts. A fine street, the Corso Vittorio Emmanuele, winds along the slopes behind the city from the Mergellina railway station till it reaches the museum by the Via Salvator Rosa. The character of the shore of the eastern crescent has been much altered by the new harbour works, which, with the wharves and warehouses, have absorbed the Villa del Popolo, or People's Park, originally constructed on land reclaimed from the bay. The two crescents have now been united by the construction of a connecting thoroughfare on the seaward side of the Castel Nuovo, the royal palace, and the hill of Pizzofalcone; while a tunnel (the Galleria della Vittoria) has been cut under this hill, thus further uniting the east and west halves of the city. There is also a metropolitan underground railway between the central station at Naples and Pozzuoli.

The streets of Naples are generally well-paved with large blocks of lava or volcanic basalt. In the older districts there is a countless variety of narrow gloomy streets, many of them steep. The houses are mostly five or six storeys high, are covered with stucco made of a kind of pozzolana, which hardens by exposure, and have large balconies and flat roofs. The castle of S. Elmo (S. Erasmus), which dominates the whole city, had its origin in a fort (Belforte) erected by King Robert the Wise in 1329. The present building, with its rock-hewn fosses and massive ramparts, was constructed by Don Pedro de Toledo in 1537–46, and was long considered practically impregnable. It is now a military prison. On a small island (I. del Salvatore, the *Megaris* of Pliny), now joined to the shore at the foot of the Pizzofalcone by an arch-supported causeway, stands the Castel dell' Ovo, restored in the 16th century. Castel Nuovo, a very picturesque building constructed near the harbour in 1279–82 by Charles I. of Anjou, contains between the round towers of its façade the triumphal arch erected in 1455–58 to Alfonso I. In the interior is a fine Gothic hall. The whole building has recently been restoied. Castel del Carmine was demolished in 1906. The royal palace, begun in 1600 from designs by Domenico Fontana, partly burned in 1837, and repaired and enlarged by Ferdinand II, is an enormous building with a sea frontage of 800 ft. and a main façade 554 ft. long and 95 ft. high, exhibiting the Doric, Ionic and Composite orders in its three stories. It now contains the important National Library (Biblioteca Nazionale Vittorio Emanuele III) with valuable books and mss., including mss. recovered from Austria after they had been removed to Vienna by Charles V. Another royal palace, that of Capodimonte, contains a gallery of modern pictures and a fine collection of 18th century Neapolitan porcelain.

Naples has 237 churches and 57 chapels. Most of the churches are notable rather for rich internal decoration than for architectural beauty. The cathedral of St. Januarius was erected in 1294–1323. The general plan is that of a basilica with a nave and two (Gothic vaulted) aisles separated by pilasters. The western façade was completed in 1906. Beneath the high altar is a subterranean chapel containing the tomb of St. Januarius (San Gennaro), the patron saint of the city; in the right aisle there is a chapel (Cappella del Tesoro) built between 1608 and 1637 in popular recognition of his having saved Naples in 1527 "from famine, war, plague and the fire of Vesuvius"; and in a silver tabernacle behind the high altar of this chapel are preserved the two phials partially filled with his blood, the periodical liquefaction of which forms a prominent feature in the religious life of the city. Accessible by a door in the left aisle of the cathedral is the church of Sta. Restituta, a basilica of the 4th century. Its baptistery contains important mosaics of that period. Santa Chiara (14th century, richly restored in the baroque style in the 18th) is interesting for a fresco ascribed to Giotto (at one time there were many more), and monuments to Robert the Wise, his son's wife, Mary of Valois, and his daughter Mary, empress of Constantinople

San Domenico Maggiore, founded by Charles II. in 1289, but completely restored later, has an effective interior particularly rich in Renaissance sculpture. In the neighbouring monastery is shown the cell of S. Thomas Aquinas. San Filippo Neri or dei Gerolomini, erected in 1592–1619, has a white marble façade and contains the tombstone of Giambattista Vico. Sta. Maria del Parto, in the Chiaja, contains the tomb of Sannazaro, and is named after his poem, *De Partu Virginis*. San Francesco di Paola, opposite the royal palace, is an imitation of the Pantheon at Rome, by Pietro Bianchi of Lugano (1815–18). The church of the Certosa (Carthusian monastery) of San Martino, has now become a museum. Dating from the 14th century, and restored in the 17th, it is a building of extraordinary richness of decoration, with paintings and sculpture by Guido Reni, Lanfranco, Caravaggio, D'Arpino, Solimena, Luca Giordano and Ribera. The monastery has been transformed into a mediaeval museum. The view from the south-western balcony is incomparable.

Other churches with interesting monuments are Sant' Anna dei Lombardi (the church of Monte Oliveto), built in 1414, which contains some splendid marble Renaissance sculpture; Sant' Angelo a Nilo, which contains the tomb of Cardinal Brancaccio, the joint work of Donatello and Michelozzo (1426–28), San Giovanni a Carbonara, built in 1343 and enlarged by King Ladislaus in 1400, which contains among much other remarkable sculpture the tomb of the king, the masterpiece of Andrea da Firenze (1428), and that of Gianni Caracciolo, the favourite of Joanna II, who was murdered in 1432 (the chapel in which it stands has one of the earliest majolica pavements in Italy); San Lorenzo (13th century), the Royal Church of the House of Anjou, and S. Maria Donna Regina, with its frescoes by Pietro Cavallini. The catacombs of S. Gennaro (2nd century) are in many respects not inferior to those at Rome.

Of the secular institutions in Naples none is more remarkable than the National Museum, formerly known as the Museo Borbonico. The building was put to its present use in 1790, when Ferdinand IV. placed in it the Farnese collection, which he had inherited from his father, and all the specimens from Herculaneum, Pompeii, Stabiae, Puteoli, Paestum, etc., which till then had been housed in the palace at Portici. Vast numbers of objects have since been added to it, both by purchase and from excavations, and it is now unique as a treasure house of Italo-Greek and Roman antiquities, besides containing important pictures.

The building, as now arranged, contains the large bronzes and statues on the ground floor; a gallery of Pompeian frescoes and mosaics in the entresol; the picture gallery, papyri, terra cottas and small bronzes, on the first floor; and the glass, jewellery, arms, gems, and the collection of Italo-Greek vases, on the second floor. The large bronzes are almost the only ones which have survived from classical times, the most famous of them being the seated Mercury and the dancing Faun; the marbles reckon among their vast number the Psyche, the Capuan Venus, as well as the huge group called the Toro Farnese (Amphion and Zethus tying Dirce to the horns of the bull), the Farnese Hercules, the excellent though late statues of the Balbi on horseback, and a very fine collection of ancient portrait busts.

The Galleria Umberto I. and Galleria Principe di Napoli somewhat resemble the Milan arcade. The Borsa (or exchange) is a fine building in the Piazza of the same name, bu:' over the remains of the very ancient church of Sant' Aspreno, which are still preserved in the crypt. In front of it is the fine 16th century Fontana Medina.

Educational and Learned Institutions.—The university of Naples was founded by Frederick II. in 1224, and is well equipped with zoological, mineralogical and geological museums, a physiological institute, a cabinet of anthropology, and botanical gardens. The buildings were originally erected in 1557 for the use of the Jesuits. The new building, completed in 1906, faces the Corso Umberto I. (Rettifilo), the street from the Borsa to the railway station. The famous zoological station at Naples, whose aquarium is the principal building in the Villa Nazionale, was founded by Dr. Dohrn in 1872; the marine flora and fauna of the neighbourhood are more varied than those of any district in Europe. The chief universities of the world pay £100 a year for tables to which they send students. The astronomical observatory is situated on the hill of Capodimonte.

The Royal Society of Naples, dating from 1756, is divided into three academies, namely, moral and political; physical and mathematical; letters, archaeology and fine arts. The famous Accademia Pontaniana, founded by Antonio Becardella and J. J. Pontanus in 1442, was restored in 1808 and still exists.

The Royal School for Oriental Languages owes its existence to Matteo Ripa, who in 1732 established a school for Chinese missionaries.

The Royal Conservatory of Music in S. Pietro a Majella has existed in one form or other since 1760, and has had many famous pupils.

Elementary education has been greatly improved. The higher grade schools are numerous, and there are special foreign schools, established by private enterprise.

The State archives in Vico San Severino e Sossio contain all the records of past Governments; the Notarial archives in Via San Paolo contain all the original notarial acts from 1450 onwards, to the number of 800,000. The Società di Storia Patria, established in 1875 to record all details of the history of the locality, has a good library also.

The San Carlo opera house, with its area of 5,157 sq.yd. and its stalls capable of seating 1,000 spectators, is one of the largest in Europe. It was originally built in 1737 under Charles III., but was destroyed by fire in 1816 and completely rebuilt. The Mercadante dates from 1778.

Charitable institutions are numerous in Naples. The Reclusorio or poorhouse was founded in the 18th century, and besides being a refuge for the indigent poor has a series of industrial schools attached, at which foundling boys are educated and taught trades. There are also several hospitals, the largest being the Incurabili, founded in 1519.

Harbour.—At a very early date the original harbour at Naples, now known in its greatly reduced state as Porto Piccolo, and fit only for boats and lighters, became too small. In 1302 Charles II. of Anjou began the construction of the Porto Grande by forming the Molo Grande or San Gennaro, which stretched eastward into the bay, and was terminated by a lighthouse in the 15th century. By the addition of a new pier running north-east from the lighthouse, and protected by a heavily armed battery, Charles III. in 1740 added greatly to the safety of the harbour. In 1826 the open area to the south of the Porto Grande was formed into the Porto Militare by the construction of the Molo San Vincenzo, 1,200 ft. long. The lengthening of the Molo San Vincenzo to a total of more than 5,000 ft., and the construction of curving moles on the east to meet it, has formed a large outer basin, the Avamporto, and an inner harbour (Porto Mercantile). New quays have been made all the way from the old Immacolatella landing-place to the Capitaneria di Porto, close to which is the marine railway station, with piers such that the largest liner can lie alongside the jetty. The depth of this new harbour is from 25 to 30 feet. To the east are dock basins, silos for grain and other warehouses. A modern station for handling passenger traffic was opened Oct. 1, 1936.

In 1937, 9,251 vessels of 13,292,567 tons and with 649,852 passengers arrived, bringing 2,047,548 tons of merchandise; 9,240 ships left with 601,260 tons of merchandise and 615,976 passengers.

Large sections of the harbour were utterly ruined by British and U.S. air raids during World War II.

The specialties of Naples are the manufacture of coral, tortoise-shell, kid gloves and macaroni, but it has been growing also as an industrial centre. The port of Naples is second only to that of Genoa.

Water Supply.—Naples has as fine a water supply as any city in Europe, derived from the hills in the neighbourhood of Avellino. It is received in a covered masonry canal, whence it flows in iron pipes till it reaches five enormous reservoirs constructed just opposite to the entrance gates of the royal palace at Capodimonte. Hence it comes by natural gravitation into the town at a pressure of five atmospheres, so that it supplies the highest parts of the town with abundant water. The supply was brought into the town just after the terrible cholera outbreak of 1884. The effect on the health of the city has been extraordinary. Cholera epidemics, which used to be frequent, have become things of the past, and there is now abundant water.

Modern Growth.—Naples has increased in modern times at an enormous rate. On the large areas reclaimed from the sea, hotels and mansions let in flats have been erected. The gardens at the west end of the town are all built over. The Vomero is now an important suburb. The commune has been built over in every direction, one great incentive being the creation of an industrial zone to the eastward of the city, set aside for the purpose of industrial development. It now contains a large number of factories for spinning silk, cotton, jute and wool, and the making of railway plant, automobiles, the building of ships, etc.

After the cholera epidemic of 1884, Depretis, then premier, visited Naples, and uttered the famous dictum *"Bisogna sventrare Napoli"*—"Naples must be disembowelled!" The worst slums, which lay between the centre of the town and the railway station, were pulled down and a wide street was constructed from the centre of the town to the eastward. A large working-class quarter was erected to the north and beyond the railway station, known as the Rione Vasto.

There are also new middle-class quarters at Santa Lucia, Vomero Nuovo and Sant' Efremo, Poggioreale and Fuorigrotta, and better houses on the Riviera di Chiaja, Via Elena and Via Caracciolo at Mergellina, Via Partenope near the Chiatamone, and an aristocratic quarter in the large extensions made in the Rione Amedeo. The narrow alleys of Porto, Pendino and Mercato gradually disappeared, and old Naples vanished day by day.

Folk-lore.—The charms against the Evil Eye used by the Neapolitans are derived from classical legends. They are: first, the sprig of rue in silver, with sundry emblems attached to it, all of which refer to the worship of Diana, whose shrine at Capua was of considerable importance; secondly, the serpent charms, which formed part of the worship of Aesculapius, and were no doubt derived largely from the ancient eastern ophiolatry; and lastly, charms derived from the legends of the Sirens.

History.—All ancient writers agree in representing Naples as a Greek settlement. The earliest Greek settlement in the neighbourhood was at Pithecusa (Ischia), but the colonists, being driven out of the island by the frequent earthquakes, settled on the mainland at Cumae, where they found a natural acropolis of great strategic value. From Cumae they founded Dicearchia (Pozzuoli) and subsequently Parthenope or Palaeopolis, where Naples now stands, upon the splendid natural acropolis formed by the hill of Pizzofalcone, defended on the land side by a fosse which is now the Strada di Chiaja, and a massive wall, of which remains may still be traced at the back of the existing houses. To the colonists of Parthenope there came afterwards a considerable addition from Athens and Chalcis, and they built themselves a town which they called *Neapolis*, or the "new city," in contradistinction to the old settlement, which in consequence was styled Palaeopolis or the "old city."

In 328 B.C. the Palaeopolitans having provoked the hostility of Rome by their incursions upon her Campanian allies, the consul Publilius Philo marched against them, and laid regular siege to Palaeopolis; at length the city was betrayed into the hands of the Romans. Neapolis, perhaps, surrendered without resistance, as it was received on favourable terms, had its liberties secured by a treaty, and obtained the chief authority. From that time Palaeopolis totally disappeared from history, and Neapolis became an allied city (*foederata civitas*)—a dependency of Rome, to which it remained faithful. In 280 B.C. Pyrrhus unsuccessfully attacked its walls; and in the Second Punic War Hannibal was deterred by their strength from attempting to make himself master of the town. During the civil wars of Marius and Sulla a body of partisans of the latter, having entered it by treachery (82 B.C.), massacred the inhabitants; but Neapolis soon recovered, as it was again a flourishing city in the time of Cicero.

Neapolis long retained its Greek culture and institutions; and even at the time of Strabo it had gymnasia and quinquennial games, and was divided into *phratriae* after the Greek fashion.

Many of the Romans of the upper classes, from a love of Greek manners and literature, resorted to Neapolis, either for education and the cultivation of gymnastic exercises or for the enjoyment of music and of a soft and luxurious climate. It was the favourite residence of many of the emperors; Nero made his first appearance on the stage in one of its theatres; Titus assumed the office of its archon; and Hadrian became its demarch. It was chiefly at Neapolis that Virgil composed his *Georgics;* and he desired to be buried on the hill of Pausilypon, the modern Posilipo, in its neighbourhood, though his traditional tomb is really a *columbarium* of some family unknown. It was also the favourite residence of the poets Statius (A.D. 61) and Silus Italicus (A.D. 25), the former of whom was a Neapolitan by birth.

After the fall of the Roman empire, Neapolis suffered severely during the Gothic wars. Having espoused the Gothic cause in the year 536, it was taken, after a protracted siege, by Belisarius, who diverted the water of a subterranean aqueduct, marched into the city through it, and put many of the inhabitants to the sword. In 542 Totila besieged it and compelled it to surrender, but after being recovered by Narses, it long remained a dependency of the exarchate of Ravenna, under the immediate government of a duke, appointed by the East Roman emperors. When the Lombards pushed their conquests in the south, the limits of the Neapolitan duchy were considerably narrowed. In the beginning of the 8th century, at the time of the iconoclastic controversy, the Neapolitans, encouraged by Pope Gregory III., threw off their allegiance to the Eastern emperors, and established a republican form of government under a duke of their own appointment. Under this régime Neapolis retained independence for nearly 400 years, though constantly struggling against the powerful Lombard dukes of Benevento. The Normans, in their turn, gradually superseded all powers in the south of Italy, and checked the Saracens in their advances through Apulia.

From that date the history of Naples becomes that of a kingdom, sometimes separate, sometimes merged with the kingdom of Sicily in that of the Two Sicilies. The city of Naples henceforth formed the metropolis of the kingdom to which it gave its name. (*See* NAPLES, KINGDOM OF.)

BIBLIOGRAPHY.—R. T. Günther, *Earth Movements in the Bay of Naples* (Oxford, 1905); Rolfe and Ingleby, *Naples in 1888* (London, 1888); Arthur Norway, *Naples, Past and Present* (London, 1901); G. Daria, *Storia di una capitale* (Naples, 1935).

NAPLES, BANK OF, is an autonomous, public utility, non-profit earning foundation, incorporated under a charter granted in 1866. Its origins date back to 1539 when two public-spirited Neapolitans, Aurelio Paparo and Leonardo di Palma, founded in their city a first bank with a capital of 4,000 ducats for granting loans on pledge and without or at a very low rate of interest to free the poorer classes from the evils of usury.

The institution rapidly developed, and survived all the vicissitudes of the kingdom of Naples. After the annexation of Naples to the kingdom of Italy the *Banco di Napoli* remained a bank of issue. Regional interests and the still strong traditions of regional independence maintained this situation until May 6, 1926, when the *Banca d'Italia* became the sole bank of issue.

The *Banco di Napoli* is a foundation organized as a trust, administered by a Board whose members are nominated by the Government, by the province and municipality of Naples, and by the organs representing the commercial activities of the province. Its capital and reserves stood in Dec. 1938 at 1,526 million lire. It affords throughout Italy and colonies every service of a complete bank, and acts as a savings bank, an agricultural credit bank, and a pledge bank for the southern provinces. It also discharges the services connected with emigrant remittances from abroad, for which purposes it has agencies in the U.S.A. Besides it has its own branches and affiliations in New York, Chicago, Buenos Aires and in Albania. Part of its profits are assigned to the purposes of public utility and charity, the bulk going to increase its reserves.

It is now the most powerful instrument for the progress of South Italian agriculture and one of the most effective agencies for economic development. (O. R. A.)

NAPLES, KINGDOM OF, the name conventionally given to the kingdom of Sicily on the Italian mainland (Sicily beyond the Faro), to distinguish it from that of Sicily proper (Sicily on this side of the Faro, *i.e.,* Messina).

The leaders of the Norman house of Hauteville, Robert Guiscard and Richard of Aversa, in 1059 did homage to Pope Nicholas II. (*q.v.*) for all the conquests they made both in the island and upon the mainland. In 1130 Roger de Hauteville (Roger II. as "great count" of Sicily) assumed the style of king as Roger I. In this way the south of Italy, together with the island of Sicily, was converted into one political body.

The Hohenstaufen.—After the death of Tancred, son of William II., the emperor Henry VI., of the house of Hohenstaufen, who by his marriage with Constance or Costanza d'Altavilla, daughter of Roger I. (d. 1154), laid claims to the kingdoms of Naples and Sicily, descended into Italy in 1194. He easily conquered both the mainland and the island, but died in 1197. Costanza then had her son, Frederick (b. 1194) proclaimed king, and obtained the support of the Holy See on condition that the kingdom should be once more recognized as a fief of the Church. The Hohenstaufen kings afterwards refused to admit this claim; thus provoking the persistent hostility of the popes and many foreign invasions. Costanza died in 1198, leaving Pope Innocent III. regent and tutor to her son. In 1209 Frederick married Costanza, daughter of the king of Aragon, with whose help he succeeded in reducing a large part of Sicily to obedience. Two years later he was elected king of the Romans, and in 1220 he was crowned emperor in Rome by Pope Honorius III., but continued to reside in Sicily. In 1227 Gregory IX. excommunicated him because he delayed the crusade which he had promised to undertake. Frederick sailed for Palestine the following year and on his return defeated the army which the pope had sent into Neapolitan territory, peace being made at San Germano in 1230 and the excommunication withdrawn. In 1231 he issued the celebrated Constitutions of the Sicilian kingdom at the parliament of Melfi. He died in 1250.

His son Conrad IV. succeeded to the empire, while to his illegitimate son Manfred he left the principality of Taranto and the regency of the southern kingdom. Conrad died in 1254, leaving an infant son, Conradin (b. 1252), and Manfred was appointed vicar-general during the latter's minority. In 1258, on a rumour of Conradin's death, Manfred was offered and accepted the crown of Naples and Sicily. The rumour was false, but he retained the crown, promising to leave the kingdom to Conradin at his death and to defend his rights.

Angevin and Aragonese.—In 1265 Clement IV., wishing to rid himself of the Hohenstaufen, induced Charles of Anjou, brother of Louis IX. of France, to come to Italy. Agreeing to accept the kingdom of the Two Sicilies as a fief of the Church, Charles, in 1266, marched southward with the privileges of a crusader (*see* CHARLES I., king of Naples and Sicily). Manfred was defeated and killed at Benevento, and Charles was soon master of almost the whole kingdom.

In Sicily, however, Charles's government soon made itself odious by its exactions and the insolence and cruelty of the king's French officials and favourites. The malcontents were led by the Salernitan noble Giovanni da Procida, who had induced Peter III. of Aragon, husband of Manfred's daughter Costanza, to make good his shadowy claims to the crown of Sicily. On Easter day 1282, just as Charles was preparing an expedition to the East, the popular rising known as the Sicilian Vespers broke out at Palermo and resulted in the massacre of nearly all the French in the island. Peter reached Palermo in September. Pope Martin IV. proclaimed a crusade against the Aragonese, and the war continued for many years. The Sicilian fleet under Ruggiero di Lauria defeated that of the Angevins at Malta in 1283, and in 1284 in the Bay of Naples. Charles I. died in 1286; his heir, Charles the Lame, being a prisoner, was not crowned until two years later. (*See* CHARLES II., king of Naples and Sicily, and FREDERICK III., king of Sicily.)

Charles II. died in 1309 and was succeeded by his second son Robert, who became leader of the Guelphs in Italy. War between

Naples and Sicily broke out once more, when Frederick allied himself with the emperor Henry VII. on his descent into Italy and proclaimed his own son Peter heir to the throne. Robert died in 1342; he had been a capable ruler, a scholar, and a friend of Petrarch, but his authority was limited by the rights of a turbulent and rebellious baronage (*see* ROBERT, king of Naples). He was succeeded by his granddaughter Joanna, wife of Andrew of Hungary, who was assassinated in 1345, not without suspicion of Joanna's complicity. Andrew's brother Louis, king of Hungary, attempted to make good his claims on Naples and avenge the murder of Andrew; but as Pope Clement refused to recognize his claims he went back to Hungary in 1348 and Joanna and her second husband Louis of Taranto were crowned at Naples by the pope's legate in 1352, but Niccolò Acciaiuoli, the seneschal, became the real master of the kingdom. Joanna nominated Louis of Anjou her heir, but while the latter was recognized by the anti-pope Clement VII, Pope Urban VI. declared Charles of Durazzo (great-grandson of Charles II.) king of Sicily *al di quà del Faro* (*i.e.* of Naples). Charles conquered the kingdom and took Joanna prisoner in 1381, and had her murdered the following year. Louis failed to drive out Charles, and died in 1384. A period of anarchy followed during the reigns of Charles III. and his son Ladislas, and on the latter's death in 1414 he was succeeded by his sister Joanna II. (*q.v.*), during whose reign the kingdom sank to the lowest depths of degradation. Louis died in 1434 and Joanna in 1435. Alphonso was recognized as king of Naples by Pope Eugene IV. in 1443.

Under Alphonso, surnamed "the Magnanimous," Sicily was once more united to Naples and a new era was inaugurated, for the king was at once a brilliant ruler, a scholar, and a patron of letters. He died in 1458, leaving Naples to his illegitimate son Ferdinand I (*q.v.*) (Don Ferrante), and Sicily, Sardinia, and Aragon to his brother John. Ferdinand died in Jan. 1494, and he was succeeded by Alphonso. In the following September Charles VIII. of France entered Italy and conquered the Neapolitan kingdom without much difficulty. Alphonso abdicated, and his son Ferrandino and his brother Frederick withdrew to Ischia. But Ferrandino, with the help of Ferdinand II. of Spain, was able later to reoccupy his dominions. He died much regretted in 1496 and was succeeded by Frederick. The country was torn by civil war and brigandage, and the French continued to press their claims; until, with Gonzalo de Cordoba's victory on the Garigliano in Dec. 1502, the whole kingdom was in Spanish hands.

Spanish Rule.—On Ferdinand's death in 1516, the Habsburg Charles became king of Spain, and three years later was elected emperor as Charles V.; in 1522 he appointed John de Lannoy viceroy of Naples, which became henceforth an integral part of the Spanish dominions. Spanish rule presently provoked several rebellions. On July 7, 1647, tumults occurred at Naples in consequence of a new fruit tax, and the viceroy, Count d'Arcos, was forced to take refuge in the Castelnuovo. The populace, led by an Amalfi fisherman, known as Masaniello (*q.v.*), obtained arms, erected barricades, and, while professing loyalty to the king of Spain, demanded the removal of the oppressive taxes and murdered many of the nobles. D'Arcos came to terms with Masaniello; but in spite of this, and of the subsequent assassination of Masaniello, the disturbances continued.

In 1670 disorders broke out at Messina, which developed into an anti-Spanish movement; and while the inhabitants called in the French, the Spaniards, who could not crush the rising, called in the Dutch. In 1707 an Austrian army conquered the kingdom and Spanish rule came to an end.

The Bourbons.—In Sicily the Spaniards held their own till the peace of Utrecht, in 1713, when the island was given over to Duke Victor Amadeus of Savoy, who assumed the title of king. In 1718 he had to hand back his new possession to Spain, which, in 1720, surrendered it to Austria and gave Sardinia to Victor Amadeus. In 1733 the treaty of the Escurial between France, Spain, and Savoy against Austria was signed. Don Carlos of Bourbon, son of Philip V. of Spain, easily conquered both Naples and Sicily, and in 1738 he was recognized as king of the Two Sicilies, Spain renouncing all her claims. Charles was well received and, with the Tuscan Bernardo Tanucci as his minister, introduced many useful reforms. In 1759 Charles III., having succeeded to the Spanish crown, abdicated that of the Two Sicilies in favour of his 8-year-old son Ferdinand, who became Ferdinand IV. of Naples and III. of Sicily, with a regency under Tanucci. The regency ended in 1767, and the following year Ferdinand married the masterful and ambitious Maria Carolina, daughter of the empress Maria Theresa. With the help of John Acton, an Englishman whom she made minister in the place of Tanucci, she secured a *rapprochement* with England and Austria.

On the outbreak of the French Revolution the king and queen were not at first hostile to the new movement; but in 1793 they joined the first coalition against France, instituting severe persecutions against all who were remotely suspected of French sympathies. Republicanism, however, gained ground, especially among the aristocracy. In 1798, during Napoleon's absence in Egypt and after Nelson's victory at Aboukir, Maria Carolina induced Ferdinand to go to war with France. The French marched on Naples, but not until Jan. 20, 1799, were the invaders masters of the city. On the 23rd the Parthenopaean republic was proclaimed. The Republicans were men of culture and high character, but doctrinaire and unpractical, and they knew very little of the lower classes of their own country. Meanwhile the court at Palermo sent Cardinal Fabrizio Ruffo to Calabria, to organize a counter-revolution. He succeeded beyond expectation, and with his "Christian army of the Holy Faith" (*Esercito Cristiano della Santa Fede*), consisting of brigands, convicts, peasants and some soldiers, advanced on the capital, whence the French, save for a small force under Méjean, withdrew. On June 13 Ruffo and his hordes reached Naples and, after a desperate battle at the Ponte della Maddalena, entered the city. The French in Castel Sant' Elmo and the Republicans in Castelnuovo and Castel dell' Uovo still held out and finally an armistice was concluded and a capitulation agreed upon, whereby the castles were to be evacuated and the garrisons free to remain in Naples unmolested or to sail for Toulon.

Nelson at Naples.—On June 24 Nelson arrived with his fleet, and on hearing of the capitulation refused to recognize it save in so far as it concerned the French. Ruffo indignantly declared that the treaty had been signed, not only by himself but by the Russian and Turkish commandants and by the British captain, Foote. On the 26th Nelson changed his attitude and informed the cardinal that he would do nothing to break the armistice; while Captains Bell and Troubridge wrote that they had Nelson's authority to state that the latter would not oppose the embarcation of the Republicans, who thereupon embarked on the vessels prepared for them. But on the 28th Nelson, acting on despatches from the court (in reply to his own), held up the vessels and many of the Republicans were arrested. Caracciolo, who commanded the Republican Fleet, was tried by court-martial on board Nelson's flagship, condemned to death, and hanged at the yard arm (*see* CARACCIOLO, FRANCESCO and NELSON, HORATIO NELSON).

On July 8 King Ferdinand arrived from Palermo and the State trials resulted in hundreds of persons being executed, including some of the best men in the country, such as the philosopher Mario Pagano, the scientist Cirillo, Massa, the defender of Castel dell' Uovo, and Ettore Caraffa, the defender of Pescara. After the peace of Amiens in 1802 the court returned to Naples, where it was well received. But when the European war broke out again in the following year King Ferdinand played a double game, appearing to accede to Napoleon's demands while negotiating with Britain. After Austerlitz, Napoleon declared that "the Bourbon dynasty had ceased to reign" and sent an army under his brother Joseph to occupy the kingdom.

Joseph Bonaparte and Murat.—Ferdinand and Maria Carolina fled to Palermo in 1805; in Feb. 1806 Joseph Bonaparte entered Naples as king. A cultivated, well-meaning, not very intelligent man, he introduced many useful reforms and abolished feudalism, but the taxes and forced contributions proved very burdensome. Joseph's authority did not exist throughout a large part of the kingdom, where royalist risings, led by brigand chiefs, maintained a state of anarchy, and a British force, under Sir John

Stuart, defeated the French at Maida in Calabria (July 6, 1806).

In 1808 Napoleon conferred the crown of Spain on Joseph and appointed Joachim Murat king of Naples. Murat continued Joseph's reforms and reorganized the army; and although he introduced the French codes and conferred many appointments and estates on Frenchmen, his administration was more or less native and favoured the abler Neapolitans. The king gained many sympathies; he gradually became estranged from Napoleon and secretly opened negotiations with Austria and Great Britain. In Jan. 1814 he signed a treaty with Austria, and the following month proclaimed his separation from Napoleon. But when Napoleon escaped from Elba, Murat suddenly returned to the allegiance of his old chief, marched into northern Italy, and from Rimini issued his famous proclamation in favour of Italian independence (March 30, 1815). He was subsequently defeated by the Austrians several times and on May 18 sailed from Naples for France (*see* MURAT, JOACHIM). On the 23rd the Austrians entered Naples to restore Bourbon rule.

The Restoration.—Ferdinand and Maria Carolina had continued to reign in Sicily, where the court's extravagance and the odious Neapolitan system of police espionage rendered their presence a burden instead of a blessing to the island. A bitter conflict broke out between the court and the parliament, and the British minister, Lord William Bentinck, forced Ferdinand to resign his authority and appoint his son regent and introduced many valuable reforms. In 1812 a constitution on British lines was introduced, and the queen, who was perpetually intriguing against Bentinck, was exiled. Bentinck, whose memory is still cherished in the island, departed in 1814. Ferdinand dissolved parliament in May 1815, after concluding a treaty with Austria for the recovery of his mainland dominions by means of an Austrian army. On June 9 Ferdinand re-entered Naples and bound himself in a second treaty with Austria not to introduce a constitutional government. At first he abstained from persecution and received many of Murat's old officers into his army. In Oct. 1815 Murat, believing that he still had a strong party in the kingdom, landed with a few companions at Pizzo di Calabria, but was immediately captured by the police and the peasantry, court-martialled, and shot.

Ferdinand proclaimed himself king of the Two Sicilies at the congress of Vienna, incorporating Naples and Sicily into one state, and abolished the Sicilian constitution (Dec. 1816). In 1818 he concluded a Concordat with the Church, by which the latter renounced its suzerainty over the kingdom, but was given control over education, the censorship, and many other privileges. But there was much disaffection throughout the country, and the Carbonarist lodges had made much progress, especially in the army (*see* CARBONARI). In July 1820 a military mutiny broke out at Caserta, the mutineers demanding a Spanish constitution although professing loyalty to the king. Ferdinand, feeling himself helpless to resist, acceded to the demand. The new government's first difficulty was Sicily, where the people had risen in rebellion demanding their own charter of 1812, and although the Neapolitan troops quelled the outbreak with much bloodshed the division proved fatal to the prospects of liberty.

This outbreak seriously alarmed the Powers responsible for the preservation of the peace in Europe. At the congress of Troppau (Oct. 1820) the famous protocol was issued affirming the right of collective "Europe" to interfere to crush dangerous internal revolutions. Both France and Great Britain protested against this dangerous principle; but by general consent King Ferdinand was invited to attend the adjourned congress, fixed to meet at Laibach in the spring of the following year. Under the new constitution the permission of parliament was necessary before the king could leave Neapolitan territory. This was weakly granted, after Ferdinand had sworn the most solemn oaths to maintain the constitution. He was scarcely beyond the frontiers, however, before he repudiated his engagements, as exacted by force. The powers authorized Austria to march an army into Naples to restore the autocratic monarchy. General Pepe commander of the Constitutional forces, was sent to the frontier at the head of 8,000 men, but was completely defeated by the Austrians at Rieti on March 7. On the 23rd the Austrians entered Naples, followed soon afterwards by the king. Every vestige of freedom was suppressed, and the inevitable State trials instituted with the usual harvest of executions and imprisonment. Pepe saved himself by flight. (*See* FERDINAND IV., king of Naples.)

Ferdinand died in 1825 and was succeeded by his son Francis I., an unbridled libertine, under whom the corruption of the administration assumed unheard-of proportions. (*See* FRANCIS I., king of the Two Sicilies.) He died in 1830 and was succeeded by his son, Ferdinand II., who at first awoke hopes that the conditions of the country would be improved; but on the death of his first wife, Cristina of Savoy, he married Maria Theresa of Austria, who encouraged him in his reactionary tendencies and brought him closer to Austria. The desire for a constitution was by no means dead, and the survivors of the old Carbonari gathered round Carlo Poerio, while the *Giovane Italia* society (independent of Mazzini) promoted a few sporadic outbreaks easily crushed. The following year the Venetian brothers Bandiera, acting in concert with Mazzini, landed in Calabria, believing the whole country to be in a state of revolt; they met with little local support and were quickly captured and shot, but their deaths aroused much sympathy, and the whole episode was highly significant as being the first attempt made by Italians from other parts of the country to promote revolution in the south.

Revolution of 1848.—On Jan. 12, 1848, a revolution under the leadership of Ruggiero Settimo broke out in Sicily. These events were followed by demonstrations at Naples, and on Jan. 28 the king granted the constitution. The popular demand was now that Naples should assist the Lombards in their revolt against Austria, for a feeling of Italian solidarity was growing up. Ferdinand declared war against Austria (April 7, 1848); and a Neapolitan army under General Pepe marched towards Lombardy in May, while the fleet sailed for Venice. But a dispute between the king and the parliament concerning the form of the royal oath having arisen, a group of demagogues with criminal folly provoked disturbances and erected barricades (May 14). The king refused to open parliament unless the barricades were removed. A few shots were fired on the 15th, the Swiss regiments stormed the barricades and street fighting lasted all day. By the evening the Swiss and the royalists were masters of the situation. A new ministry under Prince Cariati was appointed. Parliament was dissolved, the National Guard disbanded and the army recalled from the Po.

In Sicily the revolutionists were bitterly hostile to the Neapolitans. The Sicilian assembly met in March 1848, and Settimo in his inaugural speech declared that the Bourbon dynasty had ceased to reign and that Sicily united her destinies to those of Italy; Settimo was elected president of the Government. After the Austrian victories Ferdinand sent a Neapolitan army under Carlo Filangieri (*q.v.*) to subjugate the island. The troops landed at Messina, whose citadel had been held by the royalists throughout, and after three days' desperate fighting the city itself was captured and sacked. Filangieri marched forward, committing many atrocities. In April he reached Palermo while the fleet appeared in the bay, and tumults having broken out within the city the Government surrendered on terms which granted amnesty for all except Settimo and 42 others.

For a few months after the dissolution of the Neapolitan parliament the Government abstained from persecution, but with the crushing of the Sicilian revolution its hands were free; and when the commission on the affair of May 15 had completed its labours thousands of respectable citizens were thrown into prison, such as L. Settembrini, Carlo Poerio, and Silvio Spaventa. The abominable conditions of the prisons in which the best men of the kingdom were immured were made known to the world by the famous letters of W. E. Gladstone, which branded the Bourbon regime as "the negation of God erected into a system of government." In 1857 Carlo Pisacane, an ex-Neapolitan officer who had taken part in the defence of Rome, fitted out an expedition, with Mazzini's approval, from Genoa, and landed at Sapri in Calabria; but the local police assisted by the peasantry attacked the band, killing many, including Pisacane himself, and

capturing most of the rest. The following year, at the instance of Great Britain and France, Ferdinand commuted the sentences of some of the political prisoners to exile. (*See* Ferdinand II., king of the Two Sicilies.)

In May 1859 Ferdinand died and was succeeded by his son, Francis II. (*q.v.*). Victor Emmanuel, king of Sardinia, wrote to him proposing an alliance for the division of Italy, but Francis refused. In June part of the Swiss Guard mutinied and were shot down; and this affair resulted in the disbanding of the whole force—the last support of the autocracy. Various proposals were made for an alliance with Sardinia, but Francis rejected them and indeed began to negotiate with Austria.

Garibaldi.—In the meantime events in Sicily were reaching a crisis destined to subvert the Bourbon dynasty. Mazzini's emissaries, F. Crispi (*q.v.*) and R. Pilo, had been trying to organize a rising in favour of Italian unity and, although they merely succeeded in raising a few armed bands, they persuaded Garibaldi (*q.v.*) that the revolution, which he knew to be imminent, had broken out. Garibaldi, whose hesitation had been overcome, embarked on May 5, 1860, at Quarto, near Genoa, with 1,000 picked followers on board two steamers, and sailed for Sicily. On the 11th the expedition reached Marsala and landed without opposition. Garibaldi was somewhat coldly received by the astonished population; but he set forth at once for Salemi, where he issued a proclamation assuming the dictatorship of Sicily in the name of Victor Emmanuel, with Crispi as secretary of state. On the 15th he attacked and defeated 3,000 of the enemy under General Landi at Calatafimi; the news of this brilliant victory revived the revolutionary agitation throughout the island, and Garibald was joined by Pilo and his bands. By a cleverly devised ruse he avoided General Colonna's force, which expected him on the Monreale road, and entering Palermo from Misilmeri received an enthusiastic welcome. After three days' street fighting the Bourbonist commander, General Lanza, not knowing that the Garibaldians had scarcely a cartridge left, asked for and obtained a 24 hours' armistice (May 30). Garibaldi went on board the British flagship to confer with the Neapolitan generals Letizia and Chrétien; then he informed the citizens by means of a proclamation of what he had done, and declared that he would renew hostilities on the expiration of the armistice. Although unarmed, the people rallied to him as one man, and Lanza became so alarmed that he asked for an unconditional extension of the armistice, which Garibaldi granted; 15,000 Bourbon troops embarked for Naples on June 7, leaving the revolutionists masters of the situation. The Sardinian Admiral Persano's salute of 19 guns on the occasion of Garibaldi's official call constituted a practical recognition of his dictatorship by the Sardinian (Piedmontese) Government. In July further reinforcements of volunteers under Cosenz and Medici, assisted by Cavour, arrived at Palermo with a good supply of arms furnished by subscription in northern Italy. Garibaldi's forces were now raised to 12,000 men, besides the Sicilian *squadre*. Cavour's attempt to bring about the annexation of Sicily to Sardinia failed, for Garibaldi wished to use the island as a basis for an invasion of the mainland. When the Garibaldians advanced eastward they encountered a force of 4,000 of the enemy under Colonel Bosco at Milazzo; on July 20 a desperate battle took place, resulting in a hard-won Garibaldian victory. The Neapolitan Government then decided on the evacuation of the whole of Sicily except the citadel of Messina, which did not surrender until the next year.

The news of Garibaldi's astonishing successes entirely changed the situation in the capital, and on June 25, 1860, the king granted a constitution, and appointed A. Spinelli prime minister. Disorders having taken place between Liberals and reactionaries, Liborio Romano was made minister of police in the place of Aiossa. The king appealed to Great Britain and France to prevent Garibaldi crossing the Straits of Messina, and only just failed (for this episode *see* under Lacaita, Sir James). On Aug. 19 Garibaldi crossed with 4,500 men and took Reggio by storm. He was soon joined by the rest of his troops, 15,000 in all, the Neapolitan army collapsed before Garibaldi's advance, and the people rose in his favour almost everywhere. On Sept. 6 the king and queen sailed for Gaeta; on the 7th Garibaldi entered Naples alone, although the city was still full of soldiers, and was received with delirious enthusiasm; on the 11th a part of the royalists capitulated and the rest retired on Capua. Cavour now decided that Sardinia must take part in the liberation of southern Italy, for he feared that Garibaldi's followers might induce him to proclaim the republic and attack Rome, which would have provoked French intervention; consequently a Piedmontese army occupied the Marche and Umbria and entered Neapolitan territory with Victor Emmanuel at its head. On Oct. 1 and 2, 1860, a battle was fought on the Volturno and the Garibaldians, although inferior in numbers, were victorious. On the 26th he met Victor Emmanuel at Teano and hailed him king of Italy and subsequently handed over his conquests to him. On Nov. 3 a plebiscite was taken, which resulted in an overwhelming majority in favour of union with Sardinia under Victor Emmanuel. Garibaldi departed for his island home at Caprera, while L. C. Farini was appointed viceroy of Naples and M. Cordero viceroy of Sicily. The last remnant of the Bourbon army was concentrated at Gaeta, the siege of which was begun by Cialdini on Nov. 5; on Jan. 10, 1861, the French fleet, which Napoleon III. had sent to Gaeta to delay the inevitable fall of the dynasty, was withdrawn at the instance of Great Britain; the fortress surrendered on Feb. 13 and the royal family departed by sea. The citadel of Messina capitulated a month later and Civitella del Tronto on March 21. On Feb. 18 the first Italian parliament met at Turin and proclaimed Victor Emmanuel king of Italy. Thus Naples and Sicily ceased to be a separate political entity and were absorbed into the united Italian kingdom.

NAPOLEON I. (1769–1821), emperor of the French. Napoleon Bonaparte was born at Ajaccio on Aug. 15, 1769, the year following the reunion of Corsica with France. His father, Charles Buonaparte—it was not until after 1796 that the spelling Bonaparte was adopted—came of a good family which had been established in the island since the 16th century. The family origins may perhaps be traced to Tuscany, an Italian province, the relations of which with Corsica had always been close. Napoleon himself, in later years, scoffed at the exaggerated tales invented by flatterers and courtiers, of the lordly status formerly held by the family at Treviso and Bologna. Yet his father was undoubtedly of noble birth, and was the delegate of the Corsican nobility at Paris. Charles Buonaparte married Laetitia Ramolino, a woman of strong character and great personal beauty. He was a lawyer by profession and brought up a large family in difficult times. After the Corsicans had, several times, revolted against their Genoese masters, the republic of Genoa, despairing of ever bringing the rebels to submission, ceded its rights to France, against which the Corsicans, led by Paoli (*q.v.*) at first attempted resistance. Charles Buonaparte joined Paoli's party. He even joined him in his campaign, taking with him his wife and children,

lest they should be seized as hostages by the French. When Paoli was beaten and had to fly Charles Buonaparte became reconciled to French rule and benefited by the protection of M. de Marbeuf, the governor, to whom he was able to make himself useful. In 1779, sent on a mission to Versailles, he took with him his second son, Napoleon, for whom M. de Marbeuf had obtained a bursary at the military academy at Brienne.

EARLY LIFE

These facts enable us to understand the character of Napoleon. He was born a Frenchman, of a family which, unwilling at first to become French, afterwards unreservedly accepted the *fait accompli.* From the age of ten he was educated with other boys of his own class by French people according to French ideas. Though we must make due allowance for heredity, family influence, and the impressions of early childhood, it is an exaggeration to explain Napoleon, as historians since Stendhal have been too much inclined to do, entirely in the light of his Corsican and Tuscan origin, and to see in him the incarnation of a *condottiere,* or of a 14th century Italian city despot, a modern Castruccio Castracani. It is more important to bear in mind that young Bonaparte, born in an island which had only just become part of France, shared neither the traditions nor the prejudices of his new country.

In 1789, at the age of 20, he came into the Revolution with an open mind, feeling neither like nor dislike for many things which other Frenchmen either regretted or frankly detested. If he remained Corsican in temperament he was, by virtue of the instruction he had received, and the books he had read, preeminently a man of the 18th century. His occasional early philosophical writings leave no doubt as to this side of his character, which is also illustrated by the life-long habit of epigrammatic, well-turned, often paradoxical expression, a trait which he had in common with Chamfort and Rivarol; witness his celebrated definition of love as *"une sottise faite à deux."* Further, having lost his father in 1785, and having been designated by him as the head of the family, although he was the second and Joseph the eldest son, he had known poverty and the responsibility of helping to provide for his mother, brothers and sisters. Success was more necessary to him than to others, and the upheaval of 1789 favoured the ambitious.

We must realize therefore that he entered the Revolution in rather an unusual frame of mind, occasionally ardent, joining the Jacobins without hesitation, but also capable of coolly judging events as when on June 20, at the capture of the Tuileries, he was moved to scorn by the weakness of Louis XVI. We must also remember that, having begun his studies at the cadet school at Brienne, he completed them at the *Ecole Militaire* in Paris, where (1784–5) he received a solid grounding in the work of an artilleryman and an officer. It would be wrong to look on him as a kind of self-taught genius, a god of war, who might be said to have discovered, taught, and even created strategy and tactics.

The Artillery Officer.—He himself acknowledged, modestly and loyally, his debt to his teachers. He had studied the treatises of Bourcet and of Guibert, who had evolved from modern armaments new principles and methods of warfare. As a sub-lieutenant at Auxonne, after leaving the *Ecole Militaire,* he received at first hand instruction from baron du Teil, brother of the author of a remarkably advanced work on the use of modern artillery. He profited by the instruction, and always spoke of it with appreciation. However gifted a man may be, he still needs inspiration and counsel, and learns more from his predecessors than he himself passes on to his contemporaries and to posterity. The genius of Napoleon was not least evident in the way in which he made use of the instruction which he received. Curiously enough, Guibert in his *Système de guerre moderne* had predicted that a great man would arise to put into practice the military theories which were then taking shape. These facts, which place Napoleon in his proper intellectual environment, seem to the writer to throw more light on his mind and his character than would countless anecdotes of his childhood and schooldays, such as that at Brienne he was nicknamed *Paille au nez* by his companions because of the way in which he pronounced *Napolione.*

Between his spells of garrison duty at Valence and at Auxonne as a young artillery officer, a part of his early career of which little is known was passed in the leave which he spent on more than one occasion in Corsica, where the somewhat complicated affairs of his family demanded his presence. At Ajaccio in Sept. 1789, he found his elder brother Joseph deep in the affairs of the democratic party which had inevitably, with the progress of the Revolution, become the party of France. Paoli, who had at first thought that events in France would bring about Corsican independence, had soon been disillusioned, Jacobinism being essentially a unifying and centralising force. He inclined therefore to the counter-revolution and entered the opposite camp.

Napoleon, promoted lieutenant in 1791 on the reorganization of the artillery, was stationed for another three months at Valence, where he continued his studies, and even wrote an essay on a subject set for competition by the academy of Lyons: "What are the principles and institutions most likely to bring about the greatest happiness of mankind?" He treated the subject in the style and according to the principles of Jean Jacques Rousseau. When, years afterwards, Talleyrand showed him the essay, he threw it into the fire.

He was again in Corsica from Sept. 1791 to May 1792. Feeling ran high in the island, as a result of the disestablishment of the Catholic Church. He plunged into political intrigue, outstayed his leave, and became liable to the penalties in force against deserters and émigrés. On April 20, 1792, however, the legislative assembly had declared war on Austria. Officers were needed. Instead of undergoing any penalty, Bonaparte, whose zeal for the Revolution was well known, was made a captain. In this capacity he remained in Paris for several months, and witnessed the great events of the Revolution. After the September massacres, he went to Ajaccio to take home his sister Elisa from the convent of Saint Cyr which had just been closed. This was his last visit to his native country. The break with Paoli was now complete. Bonaparte was on the side of the *"patriotes,"* while the old champion of independence was appealing to the English against the Republic, One and Indivisible. Paoli was victorious. Bonaparte and his family, now entirely ruined, had to fly from the island and take refuge in France. This was the termination of what we may call his "insular" period. As he himself said afterwards, once he had left Ajaccio, more important affairs left him little time to think of Corsica and Paoli.

Early Military Opportunities.—In Sept. 1793, Napoleon Bonaparte was still unknown to the world which was to ring with his name. Amazed himself at his extraordinary career, and the incredible swiftness of his rise to power, he said in Saint Helena to Las Cases, "Centuries will pass before the unique combination of events which led to my career recur in the case of another." Favourable circumstances were also required to bring the young artillery officer to the front, and these were not lacking. The republic, which had challenged half Europe, had to face foreign and civil war, under conditions of anarchy. Bonaparte was a Jacobin, with a great reputation as an artillery officer. At Beaucaire, on his way to Paris, he had written a pamphlet, the *Souper de Beaucaire,* in which he had refuted the arguments of three Southern federalists or counter-revolutionaries. It is probable that it reflects a conversation which actually took place in an inn of the little town beside the Rhone. Its publication attested the patriotism of its author. The good word of Robespierre's brother and of Napoleon's compatriot, the deputy Salicetti, were also of assistance. At this juncture it was necessary to recapture Toulon, the inhabitants of which had rebelled against the Convention and called in the assistance of an English squadron. An able officer of artillery was required to direct the siege operations. Bonaparte was chosen.

There has since grown up the legend of "the great Napoleon at the siege of Toulon," though the part which he really played was essentially that of a technical expert. He found in command General Carteaux, formerly an artist, who was too ignorant even to understand that to take Toulon he must capture the position which commanded the roadstead. Things were no better under

his successor, Doppet, and until the arrival of General Dugommier, a soldier of greater experience, who, together with Gasparin, the people's commissary, recognized the knowledge and good sense of the young artillery officer.

On the fall of Toulon in Dec. 1793, Napoleon was promoted general of brigade, and in Feb. 1794 he was given the command of the artillery of the army of Italy. These were still subordinate positions, offering little opportunity for prominence. He spent the next few months—the period of the Terror—in inspecting fortifications and was even for a time "suspect" for having reconstructed an old fort at Marseilles, a town which had also risen against the Convention. He had rejoined the army of Italy, when fresh disaster seemed imminent. After the 9th Thermidor, his relations with the Jacobins became compromising. Accused of having disclosed certain plans to the younger Robespierre, he was arrested, but, in default of evidence, was released on Carnot's instructions. Nevertheless his position at this juncture was extremely precarious. Under the nerveless leadership of Schérer, he had no opportunity of distinguishing himself in the Italian campaign except at Saorgio and on the Roja. He was marking time, in fact. Like a true soldier he detested the campaign in la Vendée, and he refused the command of an infantry brigade which was to be sent against the Western royalists. Aubry, the minister of war, removed him from the active list in consequence.

Reverses.—He now experienced real poverty, and had to sell his books and his watch. He thought of taking service with the sultan to re-organize the Turkish army. Madame Tallien, wife of the member of the Convention, whom he met at this time, interested herself in him and made his peace with the authorities. When Kellermann lost the lines of the Apennines it was remembered that Bonaparte knew Italy, he was taken into consultation, and joined the topographical service of the army.

At this time, in the autumn of 1795, Hoche, Marceau and Joubert were already famous; Bonaparte was still unknown. It looked almost as if fortune were definitely against him. The only thing which he had brought back from his campaigns was the itch and, probably, the malaria, which made him very ill. He was obliged to shave his head, which was later on to bring him the nickname of *"le petit tondu."* Small in stature, thin, yellow-faced, badly dressed, his person was unimposing and no one would have seen in him the future emperor of the French.

The Insurrection of 1795.—It needed a day of revolution and of civil war to bring him into prominence, by giving him the chance to do the Republican Government a service, the vital service of saving the Republic. In the autumn of 1795 the majority of the people of Paris were chafing against dear food, *assignats* and never-ending war. The Convention, by declaring for a constitution designed to keep its own members in power, provoked an insurrection, which, owing to the weakness of General Menou, very nearly succeeded. The Convention then placed the deputy Barras in command of the home forces. He, having known and learnt to value Bonaparte at the siege of Toulon, asked for, and obtained, his appointment as second in command. The young general at once assumed complete control, issued rapid orders, forestalled the insurgents who were about to capture the artillery parked at Les Sablons, and shot them down in the rue Saint-Honoré, on the steps of the church of Saint-Roch. In less than a day he had subdued a serious royalist rising (*13 Vendémiaire*—Oct. 4, 1795). He had saved the republic and earned the nickname *Général Vendémiaire.*

ITALIAN AND EGYPTIAN CAMPAIGNS

Italy.—His first reward was the hand of Josephine, a beautiful Creole, widow of the viscount de Beauharnais, who had been guillotined during the Terror. Josephine, whose morals were none too strict, was living at this time mainly by her wits. The general was six years younger than she, but he seemed to be on the threshold of a brilliant career, and the marriage freed her from poverty. He had, in fact, as his second reward been appointed commander in chief of the Army of Italy. Like Josephine, the government of the Republic was at the end of its financial resources. At this moment, indeed, there was difficulty enough in feeding the troops; it was hoped they would live on the conquered territory. At the beginning of March 1796 Bonaparte married Josephine. At the end of the month he arrived at his headquarters at Nice.

His army consisted of thirty thousand starving soldiers, in want of everything. He issued to them the famous proclamation:—"You are badly fed and all but naked. . . . I am about to lead you into the most fertile plains in the world. Before you are great cities and rich provinces; there we shall find honour, glory, and riches." He entered Italy on April 10. His plan of campaign—the separation of the Piedmontese from the Austrians —was very simple; he executed it successfully after severe actions at Montenotte, Millesimo and Dego.

While he was conducting the campaign, he did not forget that he was a general of the Revolution, and issued to the Italian people proclamations which, while treating the Catholic religion with respect, spoke the language of liberty. The king of Sardinia took fright, and, on the advice of the Archbishop of Turin, sued for peace to an army "with neither artillery, cavalry, nor shoes to its feet." The pope and the dukes of Parma, Modena and Tuscany were not long in following the example of Victor Amadeus. Great political schemes were taking shape in Bonaparte's mind, but first he had to beat the Austrians. This was, indeed, his first experience of large-scale operations. The crossing of the bridge of Lodi was a bold achievement which made his name known in a day all over France and indeed all over Europe. That day, by an old camp custom, his soldiers dubbed him corporal, and another nick-name, the *"petit caporal,"* stuck to him.

New Republics.—In May, some weeks after the setting out of his ragged army, he entered Milan in triumph. He could write to the directory: "The republic holds all Lombardy." At that same moment he received from Paris orders which upset all his plans Sure that his resignation would not be accepted, he sent it in, and, while waiting for the answer, harried the Austrians, whose generals "faithful to the old system of warfare, scattered their troops in small detachments before a man who practised mass-movement." The further Bonaparte advanced with so small an army, the greater was the need for skill and boldness. At Arcola he suffered in his own person, by falling into a swamp. These "miracles of genius and courage" were crowned by the victory of Rivoli, followed by the preliminary negotiations of Leoben (April 18, 1797). "No other general could show such fourteen months." He had forced Austria to sue for peace. He had founded the Cispadane, the Cisalpine, and the Ligurian republics, which brought a large part of Italy under the same *régime* as France, and preparations were begun for its annexation. He had been able to provide for his army by requisitioning; to conquer without costing the treasury anything, and had even sent money to Paris. Finally when the Republicans, having lost their majority in the Councils, were in need of help, Bonaparte, though he had cause for complaint against the directory, sent them his subordinate Augereau, for the *coup de force* of Fructidor (Sept. 1797) directed against the royalists and the moderates. True, the royalists and moderates wanted peace, while Bonaparte agreed with the Jacobins, and aspired to secure France's "natural frontiers."

He was able to congratulate himself on fulfilling both desires by the Treaty of Campo-Formio (Oct. 17, 1797). By it the emperor ceded to France both Belgium and the left bank of the Rhine. Glorious as it was, however, and in keeping with Revolutionary foreign policy, the treaty, far from ending the war, perpetuated it. To assure the permanence of these conquests the goodwill of England was necessary, and England was not in a position to give it; compulsion was therefore necessary. The whole story of Napoleon up to Waterloo turns on this. Henceforth he was to struggle against England, and in that struggle he was in the end to be vanquished.

England and Egypt.—The brusqueness of his manner, and still more his popularity with the masses made him an object of suspicion, in spite of the services which he had rendered the Republic. He, on his side, despised the corrupt government of the directory, "a government of lawyers," whether Jacobin or moderate. He soon realised that their plans for an invasion of England

had no chance whatever of success. In any case he thought it prudent to quit France for a time. The East had always fascinated him. "Only in the East can one do great things," he said. Reading and reflection had convinced him that Egypt was one of the keys of the world. This idea had already emerged in the days of Louis XIV., and was taken up again during the 18th century wars between France and England; there too Napoleon had his forerunners. He planned to strike at the power of England through Egypt and the route to India, and to stir the imagination of his own country-men. The directory accepted the scheme.

The Egyptian expedition was thus indirectly to be the means of forcing the British government to recognise the territorial acquisitions of the Revolution. The weakness of this plan, a weakness inherent in the whole struggle with England, was that France had no navy. Though Bonaparte, by a fortunate combination of circumstances, was able to land his army near Alexandria (July 1, 1798), Nelson, a month later (Aug. 1), destroyed the French fleet at Aboukir. From that moment the Egyptian expedition, instead of being *"le commencement d'une grande chose"* was merely an adventure. In vain Bonaparte executed a brilliant campaign, capturing Cairo, and subduing the country in three weeks. Of the great expedition nothing has endured but famous sayings, such as "Soldiers, from these pyramids forty centuries look down on you"; the Institute of Egyptology; the diffusion of the French language in the valley of the Nile; and, in Bonaparte's own case, a romantic touch of orientalism, symbolised by his faithful mameluke Roustan. Nevertheless, to carry through his great scheme, he undertook the conquest of Syria. Acre, under Admiral Sidney Smith, held out. "That man made me miss my destiny," he said later.

18th BRUMAIRE AND THE CONSULATE

The Coup d'État.—The expedition was, in fact, a failure. Bonaparte realized that there was nothing to be done in Egypt. At the same time came news which told him that there was work for him in France. The directory was in difficulties both at home and abroad. Disorder was rampant, finance and currency desperate, discontent everywhere. The Government, not knowing which way to turn, swayed one day to the Jacobins, the next to the moderates. In Germany the war continued, and in Italy the Republican armies suffered a series of reverses, and invasion was only checked with difficulty by Brune at Bergen, and by Masséna at Zürich. The restoration of the monarchy seemed inevitable. The republic could be saved only by a military leader.

"I seek a sword," said Sieyès, one of the five directors, racking his brains for a general to whom he could confide the defence of the Republic. At that crucial moment Bonaparte decided to return. He went boldly on board a frigate, slipped through the English cruisers in the Mediterranean, and landed at Fréjus on Oct. 8, 1799. He was greeted with shouts of "Long live the republic." He was the man of the hour for all those who desired an end of anarchy but were opposed to the return of the Bourbons. Without him the Revolution was a lost cause. This consideration is essential to the understanding of the famous *coup d'état* of the *18 Brumaire* (Nov. 9, 1799).

The *coup d'état* was organized, indeed, from within. Not only had Bonaparte accomplices among those in power, he had not even to offer or to impose himself; he was sought out. Baudin, a deputy from the Ardennes, and a staunch Republican, died of joy when he heard of the return of *"Général Vendémiaire,"* who was once more to save the Republic. Of the five directors, Sieyès, though a regicide, had given up hope of saving the country except by a dictatorship, of which he hoped to be the head, with Bonaparte as his strong right hand. Roger-Ducos was of the same opinion. The third, Barras, was corrupt, and would do anything for money. Only the remaining two, Moulin and Gohier, were immovable in their Jacobinism, and had to be silenced. Resistance could come only from political circles, the assemblies, or perhaps from part of the army, where Jacobinism was still strong. The conspirators were assured in advance of the support of public opinion. It is, therefore, essential to note that the *coup d'état* was conceived and organized by Sieyès, who took charge of the parliamentary side, while Bonaparte was an executive agent charged with assuring the support of the army. We must not forget that from its origin to the days of *Fructidor* and *Prairial,* the Revolution had undergone many forcible changes and had violated its different constitutions over and over again.

The pretext for the transference of the two legislative assemblies from Paris to Saint Cloud on the *18 Brumaire* was a terrorist plot invented for the occasion. The plan, though well laid, all but miscarried. On the first day, that of *18 Brumaire,* all went well, and, as the Convention had done in *Vendémiaire,* the assemblies placed Bonaparte in command of their forces. On the morrow at Saint Cloud, affairs took a dangerous turn. The Upper Chamber or Council of the "Ancients" had been won over, but the lower or Council of the Five Hundred, whose Jacobin members had had time to summon their forces, greeted the general with shouts of "Down with the dictator! Outlaw him!" Bonaparte lost the thread of his speech, lost countenance, and for a moment was surrounded by a threatening crowd of deputies. Soldiers came to his assistance; however, the day would have been lost but for his brother Lucien, who had made his way in politics and was president of the assembly. Declaring that the right of free speech had been outraged, he dramatically threw off his insignia and rushed into the court of the Orangery to harangue the still hesitating soldiers. Bonaparte, having recovered from a fainting condition, appeared, his face bleeding where, in his agitation, he had scratched it. This made the soldiers think that he had been wounded. General Leclerc, his brother-in-law, thus charged at the head of his grenadiers and cleared the hall of the refractory deputies. That very evening Bonaparte, Sieyès and Roger-Ducos were elected "consuls" by the Council of the Ancients.

The Revolution was not over. Bonaparte was to continue it under monarchical forms, and to give it at last a government. Sieyès dreamed of giving a constitution to France, but France had worn out so many constitutions during the last ten years! Bonaparte, who had used the "ideologues" as stepping stones to power, now made it clear to them that they had a master; and of Sieyès' constitution, only such portions as suited him remained. Authority was narrowing its limits. Five directors had given place to three consuls.

First Consul.—Immediately after, Napoleon became the first, the only one, elected for ten years. Public opinion gave him what was practically unlimited power. Disillusion and anxiety made him master of France. Some were tired of violence and disorder. Others, who had profited by the Revolution to possess themselves of national property, feared the return of the Bourbons and its restoration to its former owners. The mass of the people therefore, desired the consolidation of the new *régime.* Had it not been for the *18 Brumaire,* it is probable that the restoration of the legitimate branch would have taken place much sooner, before the Napoleonic empire had consolidated the results of the revolution by permanent institutions. The great mistake of the royalists was to look upon Bonaparte as another General Monk. He replied with disdain to the overtures of the comte de Provence—the future Louis XVIII. The royalists in their turn hastened to resume the struggle against him, thus definitely marking him as the representative of the "revolution in arms."

The Revolution was further indissolubly bound to its idea of "natural frontiers," and could not surrender the conquests which the rest of Europe refused to recognise. The war had to go on, whether they liked it or not—a fact which entailed government by a soldier. With the rest of his heritage, Bonaparte had to accept the necessity which had made the weak directory as warlike as the Convention. His term of power served merely to postpone the inevitable catastrophe.

Reforms.—His first work was to restore order and to regulate the administration of government. Here his lack of prejudice helped the first consul. As has already been said, being of French education, but not of French origin, he neither disliked nor regretted the old *régime.* He was thus able to adopt the strong points of the old monarchical system and reject the weaknesses of revolutionary democracy. The Revolution had made the system of election universal, in the civil service, in the magistracy, and

in the police: a fault which killed successive governments. Bonaparte replaced the elected committees by prefects and sub-prefects, thus re-establishing and multiplying the old *intendants*. Unwilling to restore completely the independence of the magistracy, of which the parlements had availed themselves against the crown, he gave the government the right to nominate magistrates, while making them, in the interests of justice, irremovable. Thus, making use of the experience both of the monarchy and of the revolution, Bonaparte framed the system known as the constitution of the year VIII. based on administrative centralization which subordinated the nation to the State, and which has been so convenient for governments that it has been kept in being by all the succeeding régimes. Altered only in detail, it subsists today.

At the outset Bonaparte justified the hopes aroused by his *coup d'état*. The mass of the people longed for peace at home and abroad. He appeared to fill the rôle of peacemaker. Having rid himself of Sieyès, he associated with himself, for form's sake, two other consuls, Cambacérès and Lebrun, men of ripe age and moderate views, the latter of whom had been secretary to Chancellor Maupeou under Louis XV. When a plebiscite was taken, the First Consul was approved by three million votes. He immediately reassured both the solid middle class, and the revolutionaries who had enriched themselves during the Revolution. He wiped out the last relics of Jacobinism, by suppressing the progressive forced loans, and the law of hostages. He re-opened the churches and pacified the Vendée by putting an end to religious persecution and thus indicating a forthcoming *concordat* with the Pope. With the help of a former official of the monarchy, Gaudin, who became duke of Gaeta, he reorganised the finances, and prepared the way for a return to a stable currency.

Marengo and Hohenlinden.—Abroad his task was more difficult. There is no reason to think that Bonaparte was not sincere in trying to put an end to hostilities, though he may have wished to prove to the peace party that peace was unobtainable. The proof, in any case, was quickly forthcoming. The emperor of Russia having retired from the coalition, it remained to deal with England and Austria. The first consul offered a cessation of hostilities. It was a mistake to think that England, so long as she remained mistress of the seas, would ever allow France to retain possession of the mouths of the Scheldt. Pitt refused. Then Bonaparte made another miscalculation. A smashing victory on the Continent would, he thought, compel England to yield. He persisted in this erroneous idea until Waterloo. His history henceforth is a striving for the impossible, *i.e.*, the capitulation of Great Britain on a point she had never admitted—the annexation of Belgium—by a France, which was powerless at sea.

Seven months after the *18 Brumaire,* he boldly crossed the Alps by the Great Saint Bernard to compel Austria to make peace. On June 14, 1800, the hardly won victory of Marengo made him once more master of Italy. Together with Moreau's victory at Hohenlinden in December, it forced the Emperor Francis to sign the treaty of Lunéville, by which Austria recognized all the conquests of the Revolution. The left bank of the Rhine became part of France, and was divided into departments. This was the triumph of Bonaparte and of the revolution. For the first time in history France had regained her "natural frontiers," those of Gaul as known to Caesar.

By the treaty of Lunéville, the British government lost her last Continental ally. The war was costing dear, and many people were weary of it. Trade was severely affected. The first consul, who knew this, resumed in appearance the preparations for invasion, which had been begun in 1797. When, after the fall of Pitt, negotiations were begun with the London cabinet, he strove to drive a bargain, renouncing all claims on Egypt. In March 1802, the treaty of Amiens was signed. It was, and could only be a truce, but the French saw in it definitive peace, and the prestige of the first consul was increased.

Extensions of Power.—In the midst of his success there was one seed of anxiety. He was in power only for ten years. Three had already passed, and opposition was beginning to make itself felt. A Jacobin conspiracy was discovered. Soon after he narrowly escaped being killed by an infernal machine. Former terrorists were thought to be responsible, but Fouché, the minister of police, found that the criminals were royalists instigated by the irreconcilable Cadoudal. Then the Tribunate instituted by Sieyès, opposed Bonaparte's favourite ideas; the Concordat with the Pope, the Order of the Legion of Honour, the Civil Code. Their opposition would become more formidable as the ten year period drew to a close. Definitely to establish the Consulate, and to make it safe from attack, permanence was desired. Thus by a natural progression opinion tended towards the revival of the monarchy in favour of the first consul. He himself was silent, asked for nothing, and let his friends work for him. This they did most effectively.

After the triumph of the peace of Amiens, they proposed a national token of gratitude. The Senate accorded only a prolongation of power for a further ten years. This was a discomfiture. Then Cambacérès thought of consulting the people whether Napoleon Bonaparte (his Christian name was beginning to be used officially) should be made consul for life. It was carried by three and a half million to less than ten thousand votes. The first consul also received the right to choose his successor (Aug. 1802). Although he then had no children, there was nothing to prevent him from choosing his son, if he should have one.

Hereditary monarchy was thus on the point of being re-established, after so many solemn protestations to the contrary. From that time the sovereigns of Europe began to regard Bonaparte as one of themselves. They watched him "climbing step by step towards the throne," though there were to be further happenings before he reached it. It would be an error to accuse him of having sought to gain the crown by means of a new war. The establishment of the empire was an indirect consequence of the renewal of hostilities in May 1803, the immediate cause of which was a dispute over Malta and the interpretation of the treaty of Amiens, though for reasons easily understood, and beyond the control of statesmen, peace could never have been more than a truce. Could England allow France to remain in permanent possession of the finest coast line and most valuable ports of the Continent from Rotterdam to Genoa? To put the question is to answer it. And we must remember that Napoleon had received Belgium and Holland in trust for the Revolution.

Counterplots.—France and England slowly prepared for a struggle which this time must be carried to the bitter end. The twice abandoned plan of invading Great Britain was again resumed, and a camp was formed at Boulogne. Meanwhile the irreconcilable royalists, encouraged by the first consul's new difficulties, conspired with General Pichegru to assassinate him. Georges Cadoudal, who had landed in France, succeeded in implicating the celebrated Moreau, jealous of the first consul. The discovery of this plot infuriated Bonaparte. He accused the *émigrés* of ingratitude, publicly affirmed his republican sympathies, and declared that the intention was to destroy the revolution in his person. He determined to strike.

A young prince of the house of Condé, the duke of Enghien one of the Bourbons, was forcibly seized on the territory of the duchy of Baden, summarily tried and shot. Bonaparte has been universally condemned for this judicial murder, which set "a ditch filled with royal blood" between the older dynasty and the throne upon whose steps he stood. His regicide monarchy was no longer suspect even to the fiercest republicans. Just as the infernal machine had contributed to the success of the first plebiscite, the conspiracy of Cadoudal and Pichegru facilitated the proclamation of the empire. The first consul had escaped the conspirators, and the danger helped his cause.

THE FIRST EMPIRE

The consulate for life seemed too precarious; a Napoleonic dynasty would survive its founder. Since his enemies, who were the enemies of the revolution, wished to destroy him "he must be made king or emperor, so that heredity should reinforce his power by ensuring him of natural and unquestioned successors and, by rendering useless crimes against his person, should remove the temptation to commit them." (Thiers.)

Thus France returned to hereditary monarchy, approved by a

unanimous vote of the Senate, and by a plebiscite. The empire was proclaimed on May 18th, 1804, the title of emperor being chosen because the word king was inseparably connected with the Bourbons, and because it sounded more impressive, more military. It evoked, moreover, memories of Rome and of Charlemagne. And, like Charlemagne, Napoleon wished to be crowned by the Pope, not in Rome but in Paris. After some hesitation Pius VII. granted his request. On Dec. 2, at Notre Dame the amazing ceremony took place, and the soldier of the revolution became the anointed of the Lord. Moreover he took the crown from the hands of the Pope, and placed it on his own head. And Josephine the Creole adventuress, became empress. But Napoleon could dare all. He built up a new nobility, he gathered together a court. France approved of everything. When the wife of Marshal Lefebvre (the celebrated *Madame Sans-Gêne,* who had been a washer-woman) became the duchess of Dantzig he dared even ridicule.

Boulogne, Ulm and Cadiz.—The empire united the old France with the new; in it revolutionary and monarchical ideas were combined. There was general satisfaction. Prosperity had returned with ordered government. No one troubled about the one weak point. The empire could not be really established, nor the conquests of the revolution assured, without the defeat of the British power. Napoleon did not forget it, and in the midst of his re-organization of home affairs, his thoughts were on the camp at Boulogne. He knew that to settle finally with England he must overcome her on her own ground, and must have therefore, were it only for one day, free passage across the Channel. A third coalition was forming. He could, he was sure, defeat its forces by land, but this new victory would be no more effective than earlier ones, so long as the British navy was undefeated. With the help of Admiral Decrès, Napoleon had laboured since the days of the consulate to re-establish the French navy, ruined by the Revolution. But a navy is not built in a day. Failure at Boulogne was to change the fortunes of the empire.

Yet the plan was bold and simple. France had two squadrons. The destruction of one mattered little if, while it fought, the other could slip into the Channel and for 24 hours assure the transport of the troops gathered at Boulogne. On this strategy everything turned; it failed. Villeneuve failed Napoleon, as Grouchy was to fail him at Waterloo. The admiral was uneasy about his equipment, his officers, and his raw and untrained crews. His anxiety was shared by Decrès, the minister of marine. Napoleon spent the month of Aug. 1805 in cruel suspense. Villeneuve, he learnt at last, had not dared to enter the Channel and instead of bearing towards Brest, was making sail to the south. Once more the invasion of England must be abandoned, or at least postponed. Austria was openly threatening, Russia was arming, Prussia could not be depended upon. Austria must be brought to the knees without delay. Napoleon broke up the camp at Boulogne, marched into Germany with amazing rapidity ("The emperor makes war with our legs," said his soldiers) and forced General Mack to surrender at Ulm on Oct. 19.

Two days later this magnificent victory, with all those which were to follow it, was nullified. Villeneuve, blockaded by Nelson in Cadiz, had tried to escape. The British fleet, though smaller in numbers, had destroyed the Franco-Spanish off Cape Trafalgar. From that day the French empire was doomed. Napoleon was faced with the hopeless task of subduing England, absolute mistress of the seas. All his future was governed by that impossibility.

Austerlitz and Jena.—Because he had not crossed the Straits of Dover, he was to go in vain even to Moscow. In vain he sought to triumph first over the Continental powers, hoping then to find the British government discouraged and in a mood for compromise. The Russians having offered battle, he defeated them, and also a fresh Austrian army, in the most brilliant of his victories, that of Austerlitz (Dec. 2, 1805), exactly a year after his coronation. In a few weeks the third coalition was wiped out.

The armies of France, under the single command of a man who was a military genius and an absolute sovereign, seemed invincible. Napoleon, and perhaps he alone, knew that no decision had been reached. He rejected Talleyrand's plan for a reconciliation with Austria, and, returning to the idea which had inspired his Egyptian expedition, planned to strike at England through the East. By the peace of Pressburg he made of a subjugated and diminished Austria a means of communication with Constantinople. The vision was taking shape. To realize it, however, he must dominate all Europe. Within a few years he exhausted the Empire in the attempt. With the conquest of Belgium as a starting point, the revolution urged its successor to vast enterprises, for which neither the military genius of Napoleon nor his political ability would suffice. It was not mania for conquest but the logical development of these schemes which led him to annexations and dangerous territorial adjustments which disquieted all Europe. His brother Joseph became king of Naples, his brother Louis king of Holland. He formed the states of Southern Germany into the Confederation of the Rhine, with himself as president. Prussia, charged with closing the Baltic to the English, was promised Hanover, and the Bourbons, dethroned in Naples, were to have the Balearic isles. After the death of Pitt, he tried to conciliate England by offering secretly to restore Hanover. These diplomatic moves served only to make him two enemies, Prussia, which he had humoured for so long, and Spain, a former ally.

The Prussian campaign saw another of the lightning strokes which he understood so well. The Prussian Army, which had lived on the reputation gained under the great Frederick, was routed at Jena (Oct. 1806). In a few weeks the defence had collapsed, and Napoleon was master of the greater part of Prussia.

The Subjugation of Europe.—Since Prussia had refused to lend herself to his schemes, he would make northern Germany another annex to his empire, himself closing the Baltic and eventually all Europe, to English commerce. From Berlin he promulgated the Continental blockade, an idea arising naturally out of the situation, simple, easy to set out on paper, but entailing the suppression of the independence of all the nations of Europe, since the prohibition of trade with England to be effective must be general. The Continental blockade was the consequence of and the counter-strike to Trafalgar.

But Napoleon was caught in a net from which there was no escape. He had set himself an endless task. After Ulm had to come Austerlitz, after Austerlitz, Jena. After Jena he had to complete the conquest of Prussia, and to complete it, to defeat Russia, penetrate further into the East, cross the Vistula. At Eylau (Feb. 8, 1807), three hundred leagues away from France, he fought in the snow a bloody and inconclusive battle. A new effort, the calling up of next year's conscripts was demanded of Frenchmen "that peace might be won." In June at Friedland, the *grande armée* was again victorious.

Once more Napoleon had the illusion that the goal was reached, that he was master of Europe and could hold England to ransom. The tzar Alexander, highly strung and impressionable, was now won over to the idea of an agreement with the emperor of the French for a policy of partition on 18th century lines. This time Turkey was to be divided instead of Poland. Napoleon was convinced that, allied with Russia against England, able to close the Mediterranean against her, threatening her even in India, he would force her to her knees. The meeting at Tilsit, and the conclusion of the pact of friendship between the emperor of the East and the emperor of the West, seemed to justify the costly victories which had led the French army as far as the Niemen.

Spain, Prussia and Austria.—The first disappointment was that the Franco-Russian alliance determined England to fight more fiercely than ever; her answer was a declaration of war against Russia, and the bombardment of Copenhagen. The Continental blockade everywhere led to increasing difficulties. Portugal showed no eagerness to shut out English trade. Junot had to be sent there with an army. Spain was also giving trouble, and Napoleon determined to drive the Bourbons from Madrid. As if he were transferring prefects, he placed his brother Joseph on the throne of Charles IV., and succeeded him at Naples by Murat, who had married Caroline Bonaparte. At the same time the occupation of the Papal States by General Miollis, charged with enforcing the blockade, embroiled him with the Pope. The

system drove Napoleon to increasing severity. To hold Germany and Italy, together with the Adriatic coasts, and the Spanish peninsula, would soon require a standing army of a million men, while the patience with which his conquests and his violence were endured would decrease in proportion to the dispersion of his troops.

Spain gave the signal for resistance. The Spanish people refused to recognise Joseph, and a wide spread insurrection broke out. When, in July 1808 General Dupont surrendered at Baylen, the Napoleonic empire suffered its first military reverse. The news resounded all over Europe. At the same time an English army landed in Portugal and Junot succumbed to superior numbers. Napoleon's desire to direct and control Spanish affairs had not only caused the English to be received as liberators, but had committed himself to an endless struggle against a people in arms. The uprising of the Spanish nation was infectious. In Prussia, in Tirol, in Dalmatia, patriotism was extolled, and the idea of a holy war for national independence took root and grew. In later days the emperor realized that Spain had been his first check, and that the limit of his power had been attained. In spite of a fresh interview at Erfurt, at which the two emperors paraded their friendship before an audience of kings, the Franco-Russian alliance languished. The partition of Turkey was hindered by the question of Constantinople, which neither emperor wished to see in the power of the other. Alexander was beginning to doubt the power of his new friend. Napoleon, feeling that the ill-success of his policy in Spain was injuring his prestige, determined himself to cross the Pyrenees, and re-establish Joseph in Madrid.

Incited by England and lavishly supplied with English money, Austria took advantage of his absence to re-enter the struggle. Napoleon had to return in haste from the Ebro to the Danube. The Austrian plans were carefully laid, and their opposition was far from negligible. Essling was a difficult, and Wagram (July 1809) a costly victory, but in both he carried the day.

Russia.—From these very successes, however, there arose a further complication. Napoleon had made use of Poniatowski and his Poles against the Austrians. Alexander, who, in any case, had remained neutral, feared that Napoleon was planning the reconstitution of Poland. Abandoning his former ally, he denounced the Continental blockade, and had in his turn to be encountered. The idea of conquering England by Europe and Asia, the sea by the land, had brought about a result which, though it seems at first absurd, was yet the logical conclusion.

It was with no light heart that Napoleon decided to carry the war into Russia. He still hoped that it might not be necessary, if Spain were subdued and if the United States, to whom he had ceded Louisiana and promised Florida, declared war on England, which, attacked in its vital interests by the Continental blockade, would at last sue for peace. There was no doubt that the blockade was having a disastrous effect on British trade; its results on the commerce of other nations were no less serious. Holland refused to enforce it, and Napoleon was obliged to resume control from his brother Louis, who had espoused the cause of his new subjects. He annexed the country, and divided it into departments, thus giving England a fresh reason for remaining under arms. In this way the Continental blockade led either to fresh wars or to expansions of territory which the English inevitably refused to recognise, since they had never recognised those revolutionary conquests which the new ones consolidated.

France was growing uneasy. Common sense made it clear that this extension of territory and of war could not go on indefinitely, and yet no end was in sight. Far-seeing members of the emperor's own circle, such as Talleyrand and Fouché, began to fear that affairs were going wrong. "If it only lasts," said Laetitia Ramolino, *Madame Mère*. Yet the empire never seemed so great, nor the future so secure as in 1810.

Marie-Louise.—Already on a level with kings, Napoleon in his second marriage equalled the proudest dynasties. The head of the house of Habsburg gave him the hand of his daughter. Josephine, though she was loved by the people and her dethronement regretted, was growing old and she had given him no heir. He was tired of her, and anxious to ensure the succession. The emperor of Austria must have shared his confidence in the future, since he was willing to accept the "Corsican ogre" as his son-in-law. The marriage contract with the archduchess was modelled on that of Louis XVI. and Marie-Antoinette, into whose family he was now admitted, in one of the most extraordinary episodes of even his life. The following year Marie-Louise bore him a son; the empire had an heir, who was given the title king of Rome, as the heir to the Holy Roman Empire had been named king of the Romans. But in 1811 Rome was but the capital of the department of the Tiber. The pope had been deported to Savona and was about to be imprisoned at Fontainebleau. By the Continental blockade the restorer of Catholicism in France had been led to alienate Catholics all over the world. Nevertheless, excommunicated, having driven the Bourbons from Naples and from Madrid, the man who 20 years before had been an insignificant officer with neither name nor fortune, married a daughter of the Habsburgs. Confident in his star, he carried all before him.

Though his marriage gratified his ambition, Napoleon had decided upon it only after the failure of negotiations for an alliance with a sister of Alexander. He would have preferred a Russian princess, for more than one old veteran of the Revolution, remembering Marie-Antoinette, asked why the "little corporal" should marry another "Austrian." But the Russian emperor was gradually disengaging himself from the alliance, on which Napoleon was ceasing to rely.

Moscow.—Realising that the Russians would never consent to the extension of the French empire, which under the necessity of the Continental blockade had ended by annexing the Hansa towns of Bremen and Hamburg, and making them the principal cities of two of its hundred and thirty departments, he saw that war was inevitable. French territory now stretched to the Baltic, and the nearer its boundaries approached those of Russia, the greater was the danger of conflict. Difficulties arose continually over Oldenburg, Poland, the East, and the reluctance of Russia to abandon trade with England. The two allied emperors were arming against each other. These preparations were themselves a further offence. Convinced that this new struggle had been decreed by fate, and that his work would not be accomplished till he had vanquished Russia as he had vanquished Prussia and Austria, Napoleon now assembled for the campaign of 1812 the greatest army which the world had yet seen, an army of "twenty nations" made up of contingents from all the peoples allied to or dependent on France, a sort of Western crusade against Asiatic Russia. By natural inclination, as much as by policy, Napoleon raised again for this crusade the battle cry of the Revolution, the liberation of nationalities, of which the reconstitution of Poland was to be the token. He forgot that the Spaniards were already fighting for their independence, and that the nationalism, awakened by principles of the Revolution, was stirring the people of Germany. Alexander, who could play many parts, also spoke the language of liberalism, invoked justice, enlisted on his side the countries defeated and subjugated by France or in rebellion against her, and prepared for peace with Prussia and Austria by complicity in the partition of the Polish provinces. Napoleon was thus to stake everything on the inevitable Russian campaign. Victorious, he would be master of the East, of Constantinople, of all Europe, and would at last force the English to capitulate. Defeated, he himself would have given the signal for the debacle. The war which began in 1792, having carried the French to the gates of Moscow was to return by a swift and violent revulsion to the gates of Paris.

In June 1812 the *grande armée* crossed the Niemen. According to their custom, the Russians declined battle. Alexander had said that he would retire if necessary beyond Tobolsk, while Napoleon imagined himself dictating peace from Moscow. The Russians set fire to the city, and made no peace. Then began a retreat which after the passage of the Beresina became a disaster. In the month of December, Ney and Gérard arrived at Königsberg almost alone. The *grande armée* had melted away. Realising the extent of the catastrophe, and its probable effects in Europe and in France itself, the emperor had secretly left the army, which was kept in ignorance of his departure. The news of General Malet's

conspiracy, which had reached him in Russia, had shown him how precarious was his position and how much weakened his prestige.

The Loss of Germany.—The subsequent history of the Empire is the story of a rapid return to the conditions under which Napoleon had assumed the dictatorship in 1799. The Republicans themselves on the *18th Brumaire* had entrusted him with the task of saving the Revolution and its conquests. To this end France had allowed him to take the crown, to found a dynasty, to overrun three-quarters of Europe and to raise countless armies. All in vain. In a few months he was back at his starting point.

The Spanish insurrection of 1809 had encouraged England to persevere, and had revived the resistance of the conquered peoples. The disasters of the Grand Army in 1813 spurred on his enemies still more. "A few more sacrifices," said the English, "and our end is accomplished." Not even the long hoped for declaration of war by the United States, due not to French diplomacy but to the doctrine of the freedom of the seas as opposed to the English "tyranny at sea," could affect the determination of the British government. Everything pointed to a vast change of fortune in favour of the cause of which England, at one moment, had remained the sole champion. Nationalist propaganda was bearing fruit in Germany. Prussia, while still protesting fidelity to Napoleon, had shifted her allegiance, and secretly reconstituted her army. A Prussian corps in French service, commanded by General York, went over to the Russians. Its defection made a great sensation in Germany and hastened the continued retreat to the Elbe of the remnants of the French army. The Prussian government then unmasked and, obedient to popular opinion, proclaimed a war of liberation and independence.

Napoleon chose to consider his Russian defeat as an accident. In Germany it would always be easy for him, he thought, to beat the Prussians and the Russians; having raised and trained a fresh army he did, in fact, beat them at Lutzen and at Bautzen. The campaign of 1813 opened well. He was, however, justly apprehensive of Austria, and instead of following up these fresh successes he agreed to an armistice, so as to be ready for the third adversary. A coalition of Austria, Prussia and Russia had no terrors for him. He wished to settle with it as quickly as possible, thinking that he held enough cards to secure even from England a favourable peace. The victory of Dresden (Aug. 27) seemed to justify this. But, one after the other, his generals, badly served by their contingents from the Germanic Confederation, were beaten in the field, and his plans were delayed. At Leipzig, where he had returned to prevent the junction of his three opponents, Napoleon fought a three days' battle (Oct. 16–19), during which his Saxon troops went over to the enemy. Having lost this immense battle, and all Germany with it, he had to fall back to the Rhine. In November what had been the *grande armée* entered Mainz, after fighting its way through the Bavarians who in their turn had betrayed him.

Was it possible, on the banks of the Rhine, to secure peace on the basis of "natural frontiers"? The question had been identical under the Revolution. Prussia showed herself at last as the German power most fiercely opposed to France, and England insisted on the renunciation of Antwerp. This was, as it had been during twenty years of war, the question at stake.

Disintegration.—Holland had risen against French rule. Belgium was tired of conscription and of taxes, and there also was awaking an old, invincible consciousness of nationality. The British government, well informed on the condition of France, was aware of her exhaustion. Everything, they knew, had been organized for conquest, nothing for defence. The Allies were much superior in numbers. Even within its own boundaries the Napoleonic empire was tottering. Their determination to finish the business once and for all carried even more weight than Prussia's hatred, and the negotiations which took place before the Allied entry into Paris were for that reason insincere. It had been clear since 1798 that, with England undefeated, France could make peace only on returning to her former frontiers.

No one knew better than Napoleon himself that he was, as the Convention and the directory had been, bound hand and foot by the war and its conquests. He must defend those conquests to the end, or perish with them, as the Revolution had perished. The very nature of his power and the conditions on which he had received it, forbade him that honourable and prudent peace which he has been vainly reproached for failing to achieve. First the allies would have none of it, though their unwillingness was veiled to give the impression in France that only the insensate ambition of the emperor stood in the way; secondly, no government of revolutionary origin could accept the former boundaries. The situation was the same as in 1799. "As things are," said Napoleon, "no one but a Bourbon can succeed me."

The Bourbons, however, succeeded him for another reason. When the Allies invaded France in 1814, they were not in agreement on the form of government. They had not made war for the re-establishment of the monarchy before or now. The Austrian emperor preferred the regency of his daughter Marie-Louise, which would have given him control of French policy. The emperor of Russia dreamed of a king of his making, such as Bernadotte, one of the luckiest adventurers of the Revolution, who by an unprecedented combination of circumstances had become crown prince of Sweden and had betrayed Napoleon. Prussia, concerned only with her own aggrandisement, cared little who ruled in France provided that she obtained her share of the spoils.

Thus Castlereagh, who wished to see France smaller, but free and in subjection neither to Austria nor to Russia, became convinced that a Bourbon monarchy alone would fulfil England's conditions, since, according to Albert Sorel, "this government of principles and not of expedients would be neither the debtor nor the client of any of the Allies." Unknown to, or uncomprehended by the French, this was the reason for the restoration, which to them seemed to be arbitrarily imposed by the enemy, though, in accordance with the English theory of the balance of power, it was intended to preserve their national independence.

Napoleon's campaign in France, the most brilliant of them all, was a barren masterpiece. Albert Sorel has compared his victories, Brienne, Champaubert, Montmirail, Montereau, to that of Valmy. The Allies hesitated and wondered whether to negotiate. But just as the Revolution had demanded that the enemy should quit French territory, so Napoleon insisted on the guarantee of "natural frontiers." He could do no less, but the object of the coalition was to deprive France of them. "We must reassume the uniform and the courage of '93," he said in Feb. 1814. He clung instinctively to the Revolution, and welcomed the proffered assistance of Carnot, former comrade of Robespierre, and one of the few revolutionaries who had held aloof from the empire. The allies on their side remembered that when, after Valmy, the invaders had retired behind the Rhine, Revolutionary France had decided to pursue them. This recollection stiffened their determination, and strengthened their alliance. The four powers bound themselves afresh by the pact of Chaumont, and resumed the offensive, determined to dictate terms of peace.

Everything was crumbling around Napoleon. With the last levies which France could give him, scarcely more than children, he again tried to hold back the enemy, then to outflank and defeat them. His plans failed for want of men. On March 30 the Allies were masters of Paris, and a German wrote from Montmartre, "Nine and a half centuries ago our emperor Otto planted his eagles on these hills."

Abdication.—On April 11, 1814, at Fontainebleau, Napoleon abdicated. Not only had his Senate, the child of the *Corps Législatif* of *Brumaire*, itself the child of the Convention, deserted him and declared for the Bourbons, but his marshals fiercely urged him to renounce his sovereignty and leave the country. They had returned to the position before the *18 Brumaire*, from which the Directory had sought to escape. It is again Albert Sorel who notes that the empire ended, as the consulate began, by one of those "days" which had overthrown so many revolutionary governments. On May 5, Louis XVIII. entered Paris, while the fallen emperor landed on the island of Elba where his sovereignty was recognized. The former master of Europe now reigned over a few square miles. But he was only forty-five and in the full force

of his powers. A man of such immense energy and such ardent imagination could not resign himself so easily to defeat.

Only 25 years separated the beginning of the revolutionary era from his fall. A quarter of a century, however crowded with events, is a short space of time. What had happened? In the part of its programme which included republican government, and "natural frontiers," the Revolution had doubly failed: first, when to save itself it had had recourse after the 18th *Brumaire* to a dictatorship, to absolute sovereignty, to the empire; and again when after incessant fighting for "natural frontiers," the empire had ended by laying France itself open to invasion. Conditions which the Revolution would never accept even though the refusal involved a military despotism, were now imposed. France was obliged to return to her former boundaries, and this involved the restoration of the Bourbons. It was the only possible solution, and there were few in 1814 who did not accept it. Talleyrand, who was far from being a legitimist, played a principal part in the restoration, simply because he realized that it was the only solution. Any government, whether republican or imperial, which sprang from the revolution, was doomed to war, and France had already waged war to the limit of her strength. The monarchy alone could assume the heavy responsibility of concluding peace on the terms offered. Hence when the French had forgotten the disasters and the despotism of the empire arose the reproach that the Bourbons had "returned in the baggage waggons of the enemy."

The return of Louis XVIII. was accompanied by the grant of the "Charter," and representative government. He did not restore the institutions of pre-revolutionary France, but on the contrary, retained those of Napoleon, of the year VIII., even confirming the greater number of his prefects in their office. It remained to make peace in Europe. Louis XVIII. and Talleyrand, making use of the jealousies which had arisen among the allies, sought to make the general settlement as favourable as possible to France. The Congress of Vienna was still sitting when, early in March 1815, the news came "like a bombshell" that "Bonaparte" had escaped from Elba. It had all to be done over again.

There are few examples in history of such sentimental and passionate episodes as the return from Elba. Though the good sense of the French protested against the adventure, it caught at their hearts. Napoleon brought with him so many memories, and with them the tricolor. The daring of his landing in France recalled the return from Egypt. He had only to appear, and almost all France rushed to support him. Yet moderate men realized that the emperor's new adventure was all but hopeless, and would end in a catastrophe even worse than that of 1814. Liberals regretted the loss of the "Charter." France was sick of war, and the abolition of conscription had been the most insistent demand made on the Bourbons. Napoleon maintained that he had been recalled by the people, universally dissatisfied with the restored monarchy. There was, of course, unavoidable friction between the old émigré society and the new. There were in particular soldiers who had held out alone in Germany, Holland and Italy, and had not returned to France till after the convention of April 23. These had not witnessed the invasion, and felt that the fall of the emperor had been undeserved. There was also to be reckoned with, the discontent of the officers who had been placed on half pay.

None of this was really serious, however. Only the presence of Napoleon himself, escaped from his island prison, could have brought about the flood of popular feeling by which he re-conquered France in three weeks. He had only to appear and all was forgotten, the disasters of yesterday and those which his return implied, the slaughter which had brought curses on his name, the detested conscription. Officers and men rallied round him. He had not lost his power of appealing to them, and he stirred their hearts by memories of past glory. After the first moments of hesitation the detachments first sent against him declared for him. Grenoble, then Lyons opened its gates. Marshal Ney, who had undertaken to apprehend him and to bring him back if necessary in a cage, wavered, was carried away, and fell into his arms.

The Hundred Days.—Having landed in the gulf of Juan with a handful of men on March 1, 1815, he was at the Tuileries on the 20th, and Louis XVIII. had fled to Ghent.

A hundred days: the adventure lasted no longer, and was doomed from the outset. Three months' madness. To understand why Napoleon, who, ten months before, had been deserted and denied by all, became the master of France in three weeks in a rush of passionate enthusiasm, we must take into account the change in himself, and the new rôle which he played in opposition to the Bourbons. He was not only a military genius. He was a supremely able politician, and his talents had been perfected during the revolution. He now awoke its memory, talking to the soldiers of glory and to the people of peace and liberty. The former despotic emperor returned a demagogue. Two things menaced him. There was first the fear that the allies would again take up arms, but that he assured the people would be prevented by his father-in-law, the emperor of Austria. Then there was his own despotism. But he told the peasants that they were threatened with the revival of tithes, seigniorial privileges and rights. "I come," he said, "to free you from bondage and serfdom." He who had restored the rights of the Church, and founded a new nobility now incited the mob against the nobles and the priests. To the Liberals he promised representative government, the freedom of the press, everything which Louis XVIII. had already granted, but with a new revolutionary tinge. The idea of a liberal Napoleon conformable with the principles of the Revolution, remained in men's minds. From it dates that alliance of the Bonapartists with the Liberals which disturbed the restoration and the reign of Louis Philippe, and paved the way to the era of Napoleon III.

Abroad the consequences of the return from Elba were no less grave. The allies at Vienna learned the news on March 13. They immediately declared the emperor an outlaw. The pact of Chaumont was renewed. Resumption of the war was certain, and new disasters probable for France. Talleyrand, the French representative at the Congress, was in a cruel position. Foreseeing the event, he associated himself with the allies in order at least to keep the conditions of the Treaty of Paris, and to prevent the next treaty from being made even more severe. It was easy afterwards to pillory this prudent decision, and to assert that the Bourbons had joined with the enemies of the French people. When those who had compromised themselves in the Hundred Days sought for an excuse, they used this treacherous argument.

DOWNFALL AND CAPTIVITY

Waterloo.—Napoleon had never held the illusion that the allies would permit him to reign, nor that he could reign, over a France reduced to its former boundaries. He was still subject to the law which had in the past driven him incessantly to battle. Outlawed by Europe, he prepared to fight. He could still command his followers, but the enthusiasm of the early days had evaporated and there were sinister forebodings. There were many abstentions from the plebiscite held, as before, to approve the supplementary Act to the constitution. The assembly of the *Champ de Mai* resuscitated as the festival of Federation, was gloomy. The spirit of the people was exhausted, their minds disturbed, and Napoleon's supporters uneasy. To prevent a new invasion, the Emperor left for Belgium on June 12 with the intention of separating Wellington and Blücher, who had a hundred thousand men more than he, and defeating them successively. In spite of a success at Ligny, he failed to prevent the junction of the English and the Prussians. This was partly due to what is usually called ill-fortune, but is really the resultant of many forces. Grouchy, a second-rate general to whom Napoleon had given a command in reward for political services, blundered, and remained inactive during the great battle which took place on June 18 at Waterloo—the name of a disaster unparalleled since Trafalgar. On his return to Paris on June 20 no other course but a second abdication was open to Napoleon. All was over. The Napoleonic drama culminated in disaster.

It would appear that in order to strike the imagination of mankind a hero's life should end with a great misfortune. If he had died a natural death in his palace, or fallen on the field of battle, Napoleon would never have become to posterity the figure we know. Lives like his must end in martyrdom, which crowns them with the pity caused by human suffering and the respect due

NAPOLEON I

to misfortune. Saint Helena idealised the emperor's memory, and his gaolers unwittingly prepared for him a sort of poetic immortality. Though his imprisonment in a distant island was a punishment relatively slight as compared with the torture of Joan of Arc, and though the man who placed the imperial crown upon his own head had little in common with the young girl who led her king to his crowning at Reims, there is some similarity in the moral effect and the historical renown of their death. The last phase of Napoleon's life may be regarded as his transfiguration.

After Waterloo, the energy which his presence had re-awakened relaxed. On his return to Paris he felt himself abandoned. The Chamber declared itself against him, and appointed an executive commission to govern with the ministers. He must either forcibly dissolve it, or abdicate. He decided to abdicate in favour of his son, the king of Rome, and made known his intention of going to the United States. The executive commission replied that two frigates, then in waiting at Rochefort, were at his disposal, and requested him to hasten his departure. He remained a week longer at Malmaison, then, as a last despairing throw of the dice, offered his sword against the invaders as a simple general. He then undertook to leave for America. His offer was refused. He left Malmaison on June 29 and arrived at Rochefort on July 3.

The two frigates were there, but the "Bellerophon" and other English ships were cruising before the harbour and blocked the outlet. One hope was left, to slip past and get out to sea. Napoleon would not run the risk of arrest as a fugitive. Thanking all those who offered to help him to escape, he decided on a plan he had had in mind several days, which seemed to him to be the most worthy of him as having an element of greatness, namely to demand asylum from the British government. Maitland, the commander of the "Bellerophon," had let him know that the request would be well received. Thus Napoleon wrote his famous letter to the prince regent:—

"Your Royal Highness, Exposed to the factions which distract my country and to the enmity of the greatest powers of Europe, I have ended my political career, and I come, like Themistocles, to appeal to the hospitality of the British people. I put myself under the protection of their laws, and beg your royal highness, as the most powerful, the most determined and the most generous of my enemies, to grant me this protection."

The allies at this moment were in agreement on only one point of their treatment of Napoleon. There must be no new return from Elba, and it would be perhaps even easier to return from America. The victors, to tell the truth, did not know what to do with him, and every solution presented difficulties. Their secret hope was that he would commit suicide, or perish on his way, the victim of a "White Terror." Or they would have liked Louis XVIII. on his return to Paris to have him summarily tried, condemned and executed. "We wish," wrote Lord Liverpool to Castlereagh, "that the king of France would have Bonaparte shot or hanged. It would be the best end to the business." But no one wished to take the responsibility, and Louis XVIII. less than anyone else. And Alexander I. and Wellington were working to save Napoleon's life. So the fate of the man regarded as an outlaw, "outside human society," *hostis generis humani*, had still to be decided. By his surrender to England the "Corsican ogre" laid on her the task of custody which Lord Liverpool would willingly have left to others.

Louis XVIII., who had returned to Paris on July 9, was anxious for the matter to be settled as quickly as possible, without taking the odium on himself. He ordered the prefect of Rochefort to keep the ex-emperor on the frigate *La Saale,* and to give him up to Commander Maitland, on the latter's requisition. Napoleon thought it more dignified to surrender without waiting for summons or arrest. On July 15 wearing the green coat of the *chasseurs de la garde,* and the small hat, his favourite uniform, and that in which he is always popularly represented he went on board the "Bellerophon."

One wonders if he deceived himself as to his fate and believed that the British government would allow him to go to America, or to remain at liberty in England, which had always welcomed exiles and was looked on as a political asylum. He may have remembered Paoli and Theodore, king of Corsica for a brief period, who had come to London, to die. Strangely enough there has been found among his papers a short literary exercise, an imaginary letter from Theodore asking Walpole for protection. In his school exercise books is also the phrase "Saint Helena, a little island."

The Voyage.—If Napoleon had hoped to remain at liberty he was undeceived when the "Bellerophon" arrived at Plymouth. Admiral Keith delivered to him, in the name of the British government a letter which informed "General Bonaparte" that in order to deprive him of further opportunities of disturbing the peace of Europe, it was necessary to restrain his personal liberty, and that to this end Saint Helena had been chosen as his future residence. He might take with him three companions, from among those who had accompanied him to England, and a surgeon. The emperor, on receipt of the letter, protested that he was the guest and not the prisoner of the British government, and that the rights of hospitality were being violated in his person. He then resigned himself, and set an example of stoicism to his followers. He did no more than put into writing the verbal protest which he had made to Admiral Keith.

Napoleon took with him into his captivity General Bertrand, a former grand marshal of the palace, Count Montholon, aide de camp, and General Gourgaud, and a civilian, the count de Las Cases. Countess Bertrand and Countess Montholon were of the party, as well as Las Cases the younger, and several servants. On Aug. 7 they embarked on the "Northumberland," commanded by Admiral Cockburn, and almost immediately set sail. The voyage lasted more than two months. Napoleon preserved his impassibility, even though the officers and crew had been ordered to refrain from paying him marks of respect, and he was addressed merely as "General." On arriving at Saint Helena Cockburn even said to General Bertrand, "I know of no emperor living in this island, nor of any person with a right to that position, having, as you say, travelled with me on the Northumberland."

Reading was Napoleon's chief distraction, during this long and monotonous voyage which was bearing him for ever from France and from his family. He had read to him from the *Encyclopædia Britannica* everything concerning Saint Helena and the countries near which the ship was passing. After a turn on deck he would lean against a gun, which the midshipmen soon called "the emperor's gun," and talk at length of his past life, telling stories of his career. Las Cases, who kept a journal was thus led to begin his *Memorial of Saint Helena.* Soon Napoleon himself decided to dictate his recollections, beginning with his Italian campaign.

Saint Helena.—On Sunday, Oct. 15 the "Northumberland" dropped anchor before Saint Helena. Napoleon looked through his glasses at the island which was to be his tomb, without, says Las Cases, showing the slightest emotion, and then worked as usual. They landed the next day. The dwelling intended for the prisoner was called Longwood, and, as it was in bad repair and not ready for his reception he stayed temporarily at the small house "The Briars," of which Las Cases says: "The Emperor Napoleon, who was once so powerful, and master of so many crowns, found himself reduced to a little hovel a few square feet in dimensions, with neither curtains, shutters, nor furniture. He had to sleep, dress, eat, work, live there, and if there was cleaning to be done he had to go out of doors." Napoleon protested more than once against this "infamous treatment," against the fact that he was treated as a prisoner of war, though he had himself taken refuge under the English flag, and against the prohibition of news of his wife and son. In December, Longwood was ready at last, and the little company moved there, together with Doctor O'Meara of the Northumberland who had asked to share Napoleon's exile, since no other doctor was available. He also has written an interesting account of the captivity.

Longwood, which had been a farm, was larger and a little more comfortable than "The Briars." Napoleon remained there till his death, spending his time in talking over his past career, dictating his reminiscences, reading, doing a little gardening, riding in the narrow limits permitted him, and even in learning English, which

he read fairly fluently, but would never speak. His chief troubles were the prohibition of correspondence with his family, and the badness of the food. His imprisonment became still more rigorous when, in April 1816, Admiral Cockburn was replaced by Hudson Lowe. The new Governor, obsessed with the fear of losing his prisoner, and, seeing nothing but espionage and plans of escape, made himself detested. Under his petty persecution Napoleon remembered with regret the régime of Admiral Cockburn. First Las Cases, accused of having organised a correspondence with the outer world, was deported to the Cape; O'Meara, the next to go, was replaced by the Corsican doctor, Antommarchi. In 1818 Gourgaud, who could not agree with his companions, left Saint Helena. Only Bertrand and Montholon stayed till the end.

Napoleon's health was suffering. It is possible that the climate, the food and mental anguish assisted the tendency towards cancer which he inherited from his father. His strength rapidly declined. In March 1821, he took to his bed. In April he dictated his will. "It is my wish," he said "that my ashes shall be laid to rest on the banks of the Seine among the French people whom I have loved so well." He added "I am dying before my time, murdered by the English oligarchy and its hired assassin" (Hudson Lowe). He died on the morning of May 5 in his 52nd year. His body was dressed in his favourite uniform, that of the *chasseurs de la garde,* and covered with the cloak he had worn at Marengo. He was buried in a lonely spot near a spring shaded by two weeping willows. He had often walked there. "Here lies" was on the stone. No name.

The Napoleonic Legend.—He had said one day, "What a romance my life has been." Napoleon knew mankind too well, he was in fact too great an artist not to realise that his captivity and his martyrdom gave him a magnificent opportunity of impressing himself upon posterity. On that lonely rock he was seized by an idea as great as were his plans of campaign or the *Code civil.* He would prepare, if not for himself, at least for someone of his race, something better than a return from Elba. He foresaw the nineteenth century, and would catch its imagination. Two thousand leagues away from France he divined the medley of sentiment and emotion forming there:—Austerlitz and Waterloo, the triumph and humiliation of the tricolor, the Revolution of 1789 ending in the return of the Bourbons, all the longings for liberty and for glory which would torture the people of France. Buried desires would rise again, resuscitated by regret and the magic of remembrance. Napoleon had always known how to appeal to the French people. He had not lost the art.

So the *Memorial of Saint Helena* was to become the Gospel of Saint Helena. During the hundred days he had already allied himself with the Liberals and the Republicans. The great Carnot had wept on his shoulder after the second abdication. He spent his years of exile in reviving the Napoleonic legend, in confounding it with liberalism, in "changing the eagle's plumage." He dreamed sometimes that he was working for himself, and that the people aroused by his promises would drive out their Kings and come to deliver him. "We are martyrs to an immortal cause," he said. "We struggle against oppression and the voice of the nations is for us."

In the conversations which were published to the world by his companions in captivity, he made himself the apostle of a new political doctrine, which, inspired by the principles of 1789, had the character and the fascination of a religion. It was a vast idealistic programme, a declaration of the rights and duties of the French people, a reshaping of Europe on the principles of liberty, equality, fraternity and justice. He identified his cause with that of universal freedom. The peoples must be set free, and a holy alliance of nations substituted for a holy alliance of Kings. "There are" he said "strivings for nationhood which must be satisfied sooner or later." No people should be left under the domination of another, and different sections of the same race, which wish to unite, ought not in the future to be separated. "Though they are scattered there are in Europe more than thirty million Frenchmen, fifteen million Spaniards, fifteen million Italians and thirty million Germans. I should like to have made each of these peoples a single united nation." He re-told his own story, giving it a humanitarian and idealistic bias. He represented his dictatorship as that of a liberal, or "crowned Washington," a despot in spite of himself and for the world's good, waging war to found the United States of Europe. He called himself the Messiah of the Revolution whose name would be for the peoples "the emblem of their hopes."

This lofty incarnation triumphed. Popular imagination represented Napoleon at Saint Helena as on a sort of Mount Sinai. Béranger's songs, Victor Hugo's poems added to the glamour. In 1840 the government of Louis-Philippe obeyed the national will by sending the prince de Joinville to bring back the remains of the emperor. The "return of the ashes" was a historic day. Since then, Napoleon rests in the Invalides. Another poet, Lamartine, warned Louis-Philippe that this return foreshadowed another. And, indeed, thanks to the legend woven by his uncle, after the revolution of 1848, Louis Napoleon was elected president of the republic, and then restored the empire, accomplishing in foreign policy, by his support of Italian unity, the programme of nationalities, though the integration of Italy was not yet completed. Thus the Napoleon of Saint Helena survived.

THE NAPOLEONIC RECORD

The Soldier.—We must now briefly consider this man, whose personality was in every respect far above the mean, as a commander and as a legislator—as soldier and sovereign.

His master concepts may be gathered from his various sayings. "The art of war" he said "is simple and wholly executive. There is nothing ideological about it." And again "The whole art of war consists of a careful and well-thought out defensive, together with a swift and bold offensive." Simplicity and rapidity are the dominating features both of his campaigns and his battles. "The art of war" he said at the beginning of his career "consists, with inferior forces, in always having larger forces than the enemy at the point of attack or defence." To do this rapidity of movement is required. "Energy, rapidity" was his constant admonition to subordinates. One must concentrate one's own forces, keep them together, lead the enemy to give battle in the most unfavourable conditions; then, when his last reserves are engaged, destroy him by a decisive attack and end the war as quickly as possible.

As Napoleon himself said, all these precepts could be compressed in a very small book. He had, in fact, a method, not a system. "One of the characteristic features of Napoleonic strategy," says Marshal Franchet d'Esperey, "is that, the goal once chosen and boldly chosen, the method does not vary, though, being supple, it adapts itself to circumstances." One might just as well say "the measure of the method is the commander's measure." Napoleon's power of rapidly summing up a situation and making his decision, explains his victories. As Clausewitz has well said: "On the field of battle everything depends on a decision made in a few minutes." Napoleon summed up everything, including himself, in the words: "No precise rules can be laid down. Everything depends on the character of the general, his abilities, his weakness, the quality of his troops, the range of their weapons, the weather and a thousand other circumstances which never repeat themselves." Hence before the battle his meticulous study of the position, of alternative suppositions, a keen examination of the psychology of his opponent, and the rigorous use of information, material and moral. The weak point was that everything depended on Napoleon. He saw everything, did everything, took account of the most insignificant details, himself directly gave all the orders. His lieutenants, having the habit of obedience, were merely executants who took no initiative. Berthier, although he held the position of chief of staff, said that he counted for nothing with the army. Therefore, an indisposition of the emperor was sufficient to disorganize the machine.

Then, from 1812 onwards, the number of troops involved became too large, and the commander's vision no longer sufficiently sure. It was a war of armies, not of army corps. The Napoleonic system began to give less favourable results. An exaggerated belief in his "star" and his genius, and his heavy demands on an exhausted France, explain the final catastrophe. He had long profited from the concentration of power in his own person. He

himself rejoiced in being almost the only great captain to hold absolute authority over a rich and populous country, and command its resources both of men and money. Yet in spite of his enormous intellectual energy he gave way in the end under the burden. He insisted on regulating the minutest details of his government. Thus the decree which still governs the *Theâtre Français* was signed at Moscow. Moreover his empire was precarious. Founded on victory and success, it could not survive defeat. Remembering after Waterloo Louis XIV. unshaken by misfortune, he said, "If I had been my own grandson, I could have retreated as far as the Pyrenees."

The Sovereign.—Yet he did more than win and lose battles. He gave to France laws which for the most part still endure. We have seen that when he became first consul, France had fallen practically into anarchy. The ancient laws, excessively complicated, because they differed from province to province and were customary and traditional, had been wiped out by the revolution. The new laws, so far as they existed at all, were too revolutionary in character and unadapted to normal society. The *code civil* united what in Roman law and in tradition was best suited to France under the conditions engendered by the Revolution. It may be said to be a systemization of good sense, at the same time logical and historical. Napoleon had no legal training, and his share in the work should not be exaggerated, but he intervened continually with the dominating idea that, though the work of the revolution must not be undone, order must be restored in France. Here again he profited by his lack of prejudice and his trained intelligence. He carried out the transition from old to new France. Probably he alone could have re-established the conditions necessary to settled government without being accused of relinquishing the "civil victories of the revolution." He was able to reimpose indirect taxation and in particular food taxes, the most unpopular of all, the abolition of which had made it impossible to place the finances of the Republic on a sound basis.

The council of state, the public accounts office, the courts of justice, the universities, the rights of the *Banque de France,* all these were established, counterbalancing the work of the revolutionary demagogues, and they serve to this day as restraining influences on the occasional over-violence of democracy. On the other side of the picture we see excessive centralization which stifled provincial life and local characteristics, cast the whole country in the same mould, and made the State supreme over the entire people—a system singularly favourable to "étatisme." Thus as a legislator, and as a legendary figure, Napoleon appeared as the restorer of order and authority and the embodiment of progress.

BIBLIOGRAPHY.—(I.) GENERAL. (A) *Sources.* The chief source is the *Correspondance* published by order of Napoleon III. (28 volumes, Paris 1857–59), followed by the *Oeuvres de Napoléon à Sainte Hélène* (1870, 4 vols.). This is incomplete. There should also be consulted: Lecestre, *Lettres inédites de Napoléon Ier* (1897, 2 vol.); de Brotonne, *Idem* (1898) and *Dernières lettres inédites* (1903); A. Chuquet, *Ordres et apostilles* (1911–12, 4 vol.); Picard et Tuetey, *Correspondance inédite* (1912–13, 4 vols.). The most complete itinerary has been given by Schnermans: *Itinéraire général de Napoléon Ier* (1908). For legal documents, see *Bulletin des lois,* 3rd and 4th series; Duvergier, *Collection* (vols. 12 to 18); Dalloz, *Répertoire* (1st ed. 1865–70—48 vols.). (B) *History.* Histories of the Napoleonic period are innumerable. The oldest, such as that of Sir Walter Scott, have little more than antiquarian interest. This is not the case with: Thiers, *Histoire du Consulat et de l'Empire* (1845–1862), 20 volumes with tables and maps. Numerous editions in all languages); Lanfrey, *Histoire de Napoléon Ier* (1867–75, 5 volumes); Oncken, *Das Zeitalter der Revolution des Kaiserreiches und der Befreiungskriege* (1880, 2 vol.); Taine, *Les origines de la France contemporaine,* 3rd part, *le Régime moderne* (1891–94—unfinished); A. Fournier: *Napoleon I. Eine Biographie* (Wien und Leipzig, 1886–1893, 3 vols.); Lavisse et Rambaud: *Histoire générale* (Vol. IX. 1893); Masson, *Napoléon et sa famille* (10 vol. 1897–1913); J. Holland Rose, *The Life of Napoleon I.* (1905 2 vols.); *The Cambridge Modern History* (vol. IX., *Napoleon,* 1906); W. M. Sloane, *Life of Napoleon Bonaparte* (1910, bibliog.); Lavisse: *Histoire de la France contemporaine* (Vols. II. and III. by G. Pariset, 1923); E. Ludwig: *Napoleon* (1927); Madelin, *Histoire politique 1515 to 1804* volume 4 of the *Histoire de la nation française,* by G. Hanotaux.

(II.) YOUTH AND TRAINING. (A) *Sources.* Napoleon's early works have been published by Masson and Biagi under the title *Napoléon inconnu* (1895, 2 vols.), but the editors have been charged with correcting the text improperly. (B) *History.* Gadobert, *La jeunesse de Napoléon Ier* (1897); A. Chuquet, *La jeunesse de Napoléon Ier* (3 vol. 1897–99); P. Cottin, *Toulon et les Anglais en 1793* (1898); C. J. Fox, *Napoleon Bonaparte and the Siége of Toulon* (Washington, 1902); J. Colin, *L'éducation militaire de Napoléon Ier* (1902); O. Browning, *Napoleon, the First Phase* (1905); H. F. Hall, *Napoleon's Notes on English History* (1905); H. Zivy, *Le 13 vendémiaire* (1898).

(III.) FROM THE ITALIAN CAMPAIGN TO THE 18TH BRUMAIRE. (A) *Sources.* Here must be cited the memoirs of all the great figures of that time. There are in particular, those of the directors: the memoirs of Barras (ed. Duruy 1895–96 4 vols.); of Barthélemy, ed. Y. de Dampierre (1914); of Carnot, ed. his grandson; of Gohier (1824, 2 vols.); of La Revellière (1895, 3 vols.). *See* also the *Mémoires* of Masséna, ed. Koch (1849–50, 7 volumes). For the expedition to Egypt: *Les Mémoires de Bourrienne* (Vols. II. and III. 1829); the *Lettres de Geoffroy Saint Hilaire,* ed. Hamy (1901); Volume III. of Nelson's *Despatches and Letters.* Under the title: *Paris pendant la réaction thermidorienne et le Directoire* Aulard has published many police reports and extracts from newspapers (5 vols. 1898–1902). (B) *History.* A. Sorel, *L'Europe et la Révolution française* (Vol. V. *Bonaparte et le Directoire,* 1903); Guyot, *Le Directoire et la paix de l'Europe* (1911); Clausewitz, *Der Feldzug von 1796 in Italien* (1883); Colin: *Etude sur la campagne de 1796–1797* (1818); Fabry, *Campagne d'Italie* (1900–01 3 vols.), followed by *Mémoires* (1905) and *Rapports* (1905), the whole edited by the historical section of the French General Staff; Gaffarel: *Bonaparte et les républiques italiennes, 1796–97* (1895); C. Tivaroni, *Storia critica del Risorgimento italiano* (first three vols., Turin 1888–97); Bianchi, *Storia della monarchia piemontese* (Turin 1885 4 vols. Vol. II.). The most recent and much the most satisfactory work on Egypt is La Jonquière, *L'expédition d'Egypte* (1900–07, 5 vols., ed. historical section of the General Staff). For the *coup d'état, see* Vandal, *L'avènement de Bonaparte* (Vol. I. 1903 with a critical indication as to its sources); J. Bainville, *Le 18 Brumaire* (1926); Rocquain, *L'Etat de la France au 18 Brumaire* (1874).

(IV.) THE PRIVATE LIFE OF NAPOLEON. (*A*) *Sources.* The principal memoirs are those of the Duchesse d' Abrantès (1831–37, 18 vols.); of Mme. de Remusat (1879–80, 3 vols.); the *Considérations* and *Dix années d'exil* of Mme. de Stäel; the memoirs of various members of the staff of the palace, such as Beausset (1827–28, 4 vols.), Constant (1830–31, 6 vols.), Baron Fain (1908), General Durand (1819, 2 vols.) and Meneval (1894, 3 vols.) etc. The work entitled *Mémoires et Correspondance de l'impératrice Joséphine* (1820) is apocryphal. *See* also Empress Marie-Louise, *Correspondance* 1799–1847 (Vienna, 1887); Jérôme, *Mémoires et Correspondance,* ed. du Casse (1861–66. 7 vols.); Joseph, *Mémoires et Correspondance,* ed. du Casse (1853–54, 10 vols.); Queen Hortense, *Mémoires* (3 vols. 1927). (B) *History.* Frédéric Masson, *Napoléon et les femmes* (1893); *Napoléon chez lui* (1894); Bouchot, *La toilette à la cour de Napoléon* (1895); A. Lévy, *Napoléon intime* (1893); de Lescure, *Napoléon et sa famille* (1867); Larrey, *Madame Mère* (1892, 2 vols.); Masson: *Joséphine de Beauharnais, Madame Bonaparte, Joséphine impératrice, Joséphine répudiée* (1899–1919. 4 vols.); Rocquain, *Napoléon Ier et le Roi Louis* (1875); Welschinger, *Le divorce de Napoléon* (1899), *Le Mariage de Napoléon* (*Revue révolutionnaire,* 1888. II.); Masson, *Marie-Louise* (1903); Masson, *Napoléon et son fils* (1904). *See* also BONAPARTE (*Family*).

(V.) FOREIGN POLICY AND WARS. (A) *Sources.* Martens, *Recueil général des traités d'alliance et de paix,* with appendices and tables (Göttingen, 1817–76); Talleyrand, *Lettres inédites à Napoléon,* ed. Pallain (1889), and *Mémoires,* ed. de Broglie (1891–92, 5 vols.); Metternich, *Mémoires* (8 vols., Vols. 1 and 2); Hardenberg, *Denkwürdigkeiten* (ed. Ranke, Leipzig, 1877, 5 vols.); Nesselrode, *Lettres et papiers* (Vols. III. to V. 1905–07); Castlereagh, *Memoirs and Correspondence* (1848–53, 12 vols.); Tratchevski, *Documents diplomatiques concernant les relations de la France et de la Russie* (St. Petersburg, 1890–91, 2 vols. in Russian and in French); Bailleul, *Preussen und Frankreich* Dipl. Corr. (Leipzig, 1881–87, 2 vols.). For the details of military events and the actual life of the armies we must have recourse to the memoirs of generals and soldiers, such as:—Bernadotte: *Correspondance* (1819); Davout, *Correspondance* (1887, 4 vols.) Gille, *Mémoires d'un conscrit* (1892); Lavallette: *Mémoires* (1831. 2 vols.); Coignet, *Cahiers* (1883); Marbot, *Mémoires* (1891—3 vols.); Marmont, *Mémmoires* (1856–57, 9 vols.); Murat, *Correspondance, Lettres et documents* (1899 and 1908–14); Soult, *Mémoires* (1854, 3 vols.) etc. These memoirs are of unequal value, and should be accepted with considerable reserve. (B) *History.* Bourgeois, *Manuel historique de politique étrangère,* vol. II. (1898); Sorel, *L'Europe et la Révolution française* vols. VI. VII. et VIII. with tables (1903–04); Tramond, *Manuel d'histoire maritime de la France* (1916); A. T. Mahan, *Influences of Sea Power on the French Revolution and Empire* (1892 2 vols.); Driault, *Napoléon et l'Europe* (1910); Pingaud, *Bonaparte, président de la république italienne, La domination française dans l'Italie du Nord* (1914, 2 vols.); H. A. L. Fisher, *Napoleonic Statesmanship: Germany* (1903); Froidevaux, "La politique coloniale de Napoléon" (*Revue des questions historiques,* 1901); A. Lévy, *Napoléon et la paix* (1903); Driault, *La politique orientale de Napoléon* (1904); Marshal Franchet d'Esperey and General Mangin, *Histoire militaire et navale* (Vol. VIII. of the *Histoire de la nation française* of Hanotaux).

For the details of military and diplomatic events:—Roberts: "The negotiations preceding the peace of Amiens" (*Transactions of the Royal Hist. Soc.* 1901 Vol. XX.); H. M. Bowman, *Preliminary Stages of the Peace of Amiens* (Toronto 1900); Philipson, "La Paix d'Amiens" (*Revue historique* 1901); O. Browning, *England and Napoleon in 1803* (1887); J. H. Rose, "Napoleon and English Commerce" (*Engl. Hist. Rev.* 1893); *Select Despatches . . . relating to the Formation of the Third Coalition* (1904); Coquelle, *Napoléon et l'Angleterre* (1904); O. Brandt, *England und die napoleonische Weltpolitik 1800–3* (Heidelberg 1916); Yorck von Wartenburg, *Napoleon als Feldherr* (1885–86 2 vols.); Camon: *La guerre napoléonienne: Précis des campagnes* (1903), *les Systèmes d'opérations* (1907), *les Batailles* (1910), *la Fortification* (1914); and, always interesting Jomini: *Vie politique et militaire de Napoléon Ier* (1827 4 vols. and maps). Mathieu Dumas, *Précis des évènements militaires* (1817–26 19 vols.); Roche, *Die Kontinentalsperre* (Naumbourg 1894); Oman, *History of the Peninsula War* (1902–11 4 vols.); Greillon, *Les guerres d'Espagne* (1902); Fabry, *Campagne de Russie* (1900–03, 5 vols.); Chuquet: *La guerre de Russie* (1912 3 vols.); Clement, *Campagne de 1813* (1904); Houssaye, *1814* (1 vol. 1888), *1815* (3 vols. 1895–1905); Fournier, *Der Kongress von Chatillon* (Leipzig, 1900); P. Gruyer, *Napoléon roi de l'île d'Elbe* (1906).

(VI.) Internal Politics. (A) *Sources*. Contemporary memoirs already cited; Aulard, *Paris sous le Consulat* (4 vols.), *Paris sous le premier Empire* (Vols. I. and II.) (unfinished), a collection of police reports and newspaper articles; Gaudin, duke of Gäeta: *Mémoires, Souvenirs, Opinions et Ecrits* (new edition in 3 vols., 1926); Portalis, *Discours et travaux sur le Code Civil* (1844); Pasquier, *Histoire de mon temps* (1893–95 6 vols.); *Boulay de la Meurthe: Documents sur la négociation du Concordat et sur les autres rapports de la France avec le Saint-Siège* (1891–1905 6 vols.); Villemain, *Rapport au roi sur l'instruction secondaire* (1843 in.4°); Cousin, *Défense de l'Université* (Discours, 1844); Pelet de la Lozère, *Opinions de Napoléon sur divers sujets de politique et d'administration* (1833). Forsyth, *History of the Captivity of Napoleon at St. Helena* (3 vols. 1853); Basil Jackson, *Notes and Reminiscences of a Staff Officer* (1903); Earl of Rosebery, *Napoleon, the Last Phase* (1900); R. C. Seaton, *Napoleon's Captivity in Relation to Sir Hudson Lowe* (1903); J. H. Rose, *Napoleonic Studies* (1904).

(J. Bai.)

NAPOLEON II.: *see* Reichstadt, Napoleon Francis Joseph Charles, Duke of.

NAPOLEON III. [Charles Louis Napoleon Bonaparte] (1808–1873), emperor of the French, was born on April 20, 1808, in Paris at 8 rue Cerutti (now rue Laffitte), and not at the Tuileries, as the official historians state. He was the third son of Louis Bonaparte (*see* Bonaparte), brother of Napoleon I., and king of Holland (1806–10), and of Hortense de Beauharnais (*q.v.*). Of the two other sons of Louis Bonaparte and Hortense, the elder, Napoleon Charles (1802–1807), died in infancy; the second, Napoleon Louis (1804–1831), died in the insurrection of the Romagna, leaving no children.

Exile of Hortense.—After Waterloo, Hortense, suspected by the Bourbons of having arranged the return from Elba, had to go into exile. The ex-king Louis, who now lived at Florence, had compelled her by a scandalous law-suit to give up to him the elder of her two children. With her remaining child she wandered, under the name of duchesse de Saint-Leu, from Geneva to Aix, Carlsruhe and Augsburg. In 1817 she bought the castle of Arenenberg, in the canton of Thurgau, on a wooded hill looking over the Lake of Constance. Hortense supervised her son's education in person. The young prince also studied at the gymnasium at Augsburg, and there he acquired his slight German accent.

In 1823 he accompanied his mother to Italy, visiting his father at Florence, and his grandmother Letitia at Rome, and dreaming with Le Bas on the banks of the Rubicon. He returned to Arenenberg to complete his military education under Colonel Armandi and Colonel Dufour, who instructed him in artillery and military engineering. At the age of twenty he was a "Liberal," an enemy of the Bourbons and of the treaties of 1815; but he was dominated by the cult of the emperor, and for him the liberal ideal was confused with the Napoleonic.

Revolution of 1830.—The July revolution of 1830, of which he heard in Italy, roused all his young hopes. He could not return to France, for the law of 1816 banishing all his family had not been abrogated. But the liberal revolution knew no frontiers. Italy shared in the agitation. He had already met some of the conspirators at Arenenberg, and it is practically established that he now joined the associations of the Carbonari. Following the advice of his friend the Count Arese and of Menotti, he and his brother were among the revolutionaries who in February 1831 attempted a rising in Romagna and the expulsion of the pope from Rome. They distinguished themselves at Civita Castellana, a little town which they took; but the Austrians arrived in force, and during the retreat Napoleon Louis, the elder son, took cold, followed by measles, of which he died. Hortense hurried to the spot and took steps which enabled her to save her second son from the Austrian prisons. He escaped into France, where his mother, on the plea of his illness, obtained permission from Louis Philippe for him to stay in Paris. But he intrigued with the republicans, and Casimir-Périer insisted on the departure of both mother and son. In May 1831 they went to London, and afterwards returned to Arenenberg.

For a time he thought of responding to the appeal of some of the Polish revolutionaries, but Warsaw succumbed (September 1831) before he could set out. Moreover the plans of this young and visionary *enfant du siècle* were becoming more definite. The duke of Reichstadt died in 1832. His uncle, Joseph, and his father, Louis, showing no desire to claim the inheritance promised them by the constitution of the year XII., Louis Napoleon henceforth considered himself as the accredited representative of the family. He endeavoured to define his ideas, and in 1833 published his *Rêveries politiques, suivies d'un projet de constitution,* and *Considérations politiques et militaires sur la Suisse;* in 1836, as a captain, in the Swiss service, he published a *Manuel d'artillerie,* in order to win popularity with the French army.

Strasbourg Conspiracy.—With the aid of his friend Fialin and of Eléonore Gordon, a singer, and of certain officers, such as Colonel Vaudrey, an old soldier of the Empire, commanding the 4th regiment of artillery, and Lieutenant Laity, he tried to bring about a revolt of the garrison of Strasbourg (Oct. 30, 1836). The conspiracy was a failure, and Louis Philippe, fearing lest he might make the pretender popular either by the glory of an acquittal or the aureole of martyrdom, had him taken to Lorient and put on board a ship bound for America, while his accomplices were brought before the court of assizes and acquitted (February 1837). The prince was set free in New York in April; by the aid of a false passport he returned to Switzerland in August, in time to see his mother before her death on Oct. 3, 1837.

At any other time this attempt would have covered its author with ridicule. Such, at least, was the opinion of the whole of the family of Bonaparte. But his confidence was unshaken, and in the woods of Arenenberg the romantic-minded friends who remained faithful to him still honoured him as emperor. And now the government of Louis Philippe, by an evil inspiration, began to

act in such a way as to make him popular. In 1838 it caused his partisan Lieutenant Laity to be condemned by the Court of Peers to five years' imprisonment for a pamphlet which he had written to justify the Strasbourg affair; then it demanded the expulsion of the prince from Switzerland, and when the Swiss government resisted, threatened war. Having allowed the July monarch to commit himself, Louis-Napoleon at the last moment left Switzerland voluntarily. All this served to encourage the mystical adventurer. In London, where he had taken up his abode, together with Arese, Fialin (says Persigny), Doctor Conneau and Vaudrey, he was at first well received in society, being on friendly terms with Count d'Orsay and Disraeli, and frequenting the *salon* of Lady Blessington. He was evolving his programme of government, and in 1839 wrote and published his book: *Des Idées napoléoniennes,* a curious mixture of Bonapartism, socialism and pacificism, which he represented as the tradition of the First Empire. He also noted the fluctuations of French opinion.

Boulogne Conspiracy.—The pretender, again thinking that the moment had come, formed a fresh conspiracy in 1840. With a little band of fifty-six followers he attempted to provoke a rising of the 42nd regiment of the line at Boulogne, hoping afterwards to draw General Magnan to Lille and march upon Paris. The attempt was made on Aug. 6, but failed; he saw several of his supporters fall on the shore of Boulogne, and was arrested together with Montholon, Persigny and Conneau. This time he was brought before the Court of Peers with his accomplices; he entrusted his defence to Berryer and Marie, and took advantage of his trial to appeal to the supremacy of the people, which he alleged, had been disregarded, even after 1830. He was condemned to detention for life in a fortress, his friend Aladenize being deported, and Montholon, Parquin, Lombard and Fialin being each condemned to detention for twenty years. On Dec. 15, the very day that Napoleon's ashes were deposited at the Invalides, he was taken to the fortress of Ham. On the whole the régime imposed upon him was mild. He corresponded with Louis Blanc, George Sand and Proudhon, and collaborated with the journalists of the Left, Degorge, Peauger and Souplet. For six years he worked very hard "at his University of Ham," as he said. He wrote some *Fragments historiques,* studies on the sugar-question, on the construction of a canal through Nicaragua, and on the recruiting of the army, and finally, in the *Progrès du Pas-de-Calais,* a series of articles on social questions which were later embodied in his *Extinction du paupérisme* (1844). But the same persistent idea underlay all his efforts. On May 25, 1846, he escaped to London, giving as the reason for his decision the dangerous illness of his father. On July 27 his father died.

Return to France.—He was again well received in London and he "made up for his six years of isolation by a furious pursuit of pleasure." The duke of Brunswick and the banker Ferrère interested themselves in his future, and gave him money, as did also Miss Howard, whom he later made comtesse de Beauregard, after restoring to her several millions. At the first symptoms of revolutionary disturbance he returned to France; on Feb. 25, he offered his services to the Provisional Government, but, on being requested by it to depart at once, resigned himself to this course. But Persigny, Mocquard and all his friends devoted themselves to an energetic propaganda in the press, by pictures and by songs. After May 15 had already shaken the strength of the young republic, he was elected in June 1848 by four departments, Seine, Yonne, Charente-Inférieure and Corsica. In spite of the opposition of the executive committee, the Assembly ratified his election. But he had learnt to wait. He sent in his resignation from London, merely hazarding this appeal: "If the people impose duties on me, I shall know how to fulfil them." This time events worked in his favour; the industrial insurrection of June made the middle classes and the mass of the rural population look for a saviour, while it turned the industrial population towards Bonapartism, out of hatred for the republican *bourgeois.*

Presidency of the Republic.—On Sept. 26 he was re-elected by the same departments; on Oct. 11 the law decreeing the banishment of the Bonapartes was abrogated; on the 26th he made a speech in the Assembly defending his position as a pretender, and cut such a sorry figure that Antony Thouret contemptuously withdrew the amendment by which he had intended to bar him from rising to the presidency. Thus he was able to be a candidate for this formidable power. The former rebel of the Romagna, the Liberal *Carbonaro,* was henceforth to be the tool of the priests. In his very triumph appeared the ultimate cause of his downfall. On Dec. 10 he was elected president of the Republic by 5,434,226 votes against 1,448,107 given to Cavaignac. On Dec. 20, he took the oath "to remain faithful to the democratic Republic . . . to regard as enemies of the nation all those who may attempt by illegal means to change the form of the established government." From this time onward his history is inseparable from that of France. But, having attained to power, he still endeavoured to realize his cherished project. All his efforts (Dec. 10, 1848 to Dec. 2, 1852) tended towards the acquisition of absolute authority, which he wished to obtain, ostensibly from the people.

It was with this end in view that he co-operated with the party of order in the expedition to Rome for the destruction of the Roman republic and the restoration of the pope (March 31, 1849), and afterwards in all the reactionary measures against the press and the clubs, and for the destruction of the Reds. But in opposition to the party of order, he defined his own personal policy. "The name of Napoleon," he said on this occasion, "is in itself a programme; it stands for order, authority, religion and the welfare of the people in internal affairs, and in foreign affairs for the national dignity."

In spite of this alarming assertion of his personal policy, he still remained in harmony with the Assembly (the Legislative Assembly, elected on May 28, 1849) in order to carry out "a Roman expedition at home," *i.e.,* to clear the administration of all republicans, put down the press, suspend the right of holding meetings and, above all, to hand over education to the Church. But he knew where to stop and how to keep up a show of democracy. When the Assembly, by the law of May 31, 1850, restricted universal suffrage and reduced the number of the electors from 9 to 6 millions, he was able to throw upon it the whole responsibility for this *coup d'état bourgeois.*

In fact, while trying to compass the destruction of the republican movement of the Left, he was taking careful steps to win classes. At his side were his accomplices, men ready for anything, whose only hopes were bound up with his fortunes, such as Morny and Rouher; his paid publicists, such as Romieu, the originator of the "red spectre"; his cudgel-bearers, the "Ratapoils" immortalized by Daumier, who terrorized the republicans.

Coup d'État.—He next entered upon that struggle with the Assembly, now discredited, which was to reveal to all the necessity for a change, and a change in his favour. In January 1851 he deprived Changarnier of his command of the garrison of Paris. "The Empire has come," said Thiers. The pretender would have preferred, however, that it should be brought about legally, the first step being his re-election in 1852. The Constitution forbade his re-election; therefore the Constitution must be revised. On the 19th of July the Assembly threw out the proposal for revision, thus signing its own death-warrant, and the *coup d'état* was resolved upon. He prepared for it systematically. The cabinet of Oct. 26, 1851 gave the ministry for war to his creature Saint-Arnaud. All the conspirators were at their posts—Maupas at the prefecture of police, Magnan at the head of the troops in Paris. At the Elysée, Morny, adulterine son of Hortense, a hero of the Bourse and successful gambler, supported his half-brother by his energy and counsels. The ministry proposed to abrogate the electoral law of 1850, and restore universal suffrage; the Assembly by refusing made itself still more unpopular. By proposing to allow the president of the Assembly to call in armed force, the questors revealed the Assembly's plans for defence, and gave the Elysée a weapon against it ("donnent barre contre elle à l'Elysée"). The proposition was rejected (November 17), but Louis-Napoleon saw that it was time to act. On Dec. 2 he carried out his *coup d'état.*

Proclamation as Emperor.—But affairs developed in a way which disappointed him. By dismissing the Assembly, by offering the people "a strong government," and re-establishing "a France

regenerated by the Revolution of '89 and organized by the emperor," he had hoped for universal applause. But both in Paris and the provinces he met with the resistance of the Republicans, who had reorganized in view of the elections of 1852. He struck at them by mixed commissions, deportations and the whole range of police measures. The *décrets-lois* of the year 1852 enabled him to prepare the way for the new institutions. On Dec. 2, 1852 he became in name what he was already in deed, and was proclaimed Emperor of the French.

The aim which the emperor had in view was, by a concentration of power which should make him "the beneficent motive force of the whole social order" (constitution of the 14th of January 1852; administrative centralization; subordination of the elected assemblies; control of the machinery of universal suffrage) to unite all classes in "one great national party" attached to the dynasty. His success, from 1852 to 1856, was almost complete. The nation was submissive, and a few scattered plots alone showed that republican ideas persisted among the masses. As "restorer of the overthrown altars," he won over the "men in black," among them Veuillot, editor-in-chief of *l'Univers,* and allowed them to get the University into their hands. By the aid of former Orleanists, such as Billault, Fould and Morny, and Saint-Simonians such as Talabot and the Pereires, he satisfied the industrial classes, extended credit, developed means of communication, and gave a strong impetus to the business of the nation. By various measures, such as subsidies, charitable gifts and foundations, he endeavoured to show that "the idea of improving the lot of those who suffer and struggle against the difficulties of life was constantly present in his mind." His was the government of cheap bread, great public works and holidays. The imperial court was brilliant. The emperor, having failed to obtain the hand of a Vasa or Hohenzollern, married, on Jan. 29, 1853, Eugénie de Montijo, comtesse de Teba, aged twenty-six and at the height of her beauty.

Foreign Policy.—France was "satisfied" in the midst of order, prosperity and peace. The foreign policy of the Catholic party, by the question of the Holy Places and the Crimean War (1853–1856), gave him the opportunity of winning the glory which he desired, and the British alliance enabled him to take advantage of it. In January 1856 he had the good fortune to win a diplomatic triumph over the new tsar, Alexander II. It was at Paris (February 25–March 30) that the conditions of peace were settled. The emperor was now at the height of his power. He appeared to the people as the avenger of 1840 and 1815, and the birth to him of a son, Eugène Louis Jean Joseph, on March 16, 1856, assured the future of the dynasty. It was then that, strong in "the esteem and admiration with which he was surrounded," and "foreseeing a future full of hope for France," he dreamed of realizing the Napoleonic ideal in its entirety. This disciple of the German philologists, this crowned *Carbonaro,* the friend of the archaeologists and historians who were to help him to write the *Histoire de César,* dreamed of developing the policy of nationalism, and of assisting the peoples of all countries to enfranchise themselves.

From 1856 to 1858 he devoted his attention to the Rumanian nationality, and supported Alexander Cuza. But it was above all the deliverance of Italy which haunted his imagination. But the Catholics feared that the Italian national movement, when once started, would entail the downfall of the papacy; and in opposition to the emperor's Italian advisers, Arese and Prince Jerome Napoleon, they pitted the empress, who was frivolous and capricious, but an ardent Catholic. Napoleon III. was under his wife's influence, and could not openly combat her resistance. It was the Italian Orsini who, by attempting to assassinate him as a traitor to the Italian nation on Jan. 14, 1858, gave him an opportunity to impose his will indirectly by convincing his wife that in the interests of his own security he must "do something for Italy." Events followed each other in quick succession, and now began the difficulties in which the Empire was to be irrevocably involved. Not only did the Italian enterprise lead to strained relations with Great Britain, the alliance with whom had been the emperor's chief support in Europe, and compromised its credit; but the claims of parties and classes again began to be heard at home.

The Italian war aroused the opposition of the Catholics. After Magenta (June 4, 1859), it was the fears of the Catholics and the messages of the empress which, even more than the threats of Prussia, checked him in his triumph and forced him into the armistice of Villafranca (July 11, 1859). But the spread of the Italian revolution and the movement for annexation forced him again to intervene. He appealed to the Left against the Catholics by the amnesty of April 17, 1859. His consent to the annexation of the Central Italian states, in exchange for Savoy and Nice (Treaty of Turin, March 24, 1860) exposed him to violent attacks on the part of the ultramontanes, whose slave he had practically been since 1848. At the same time, the free-trade treaty with Great Britain (January 5, 1860) aroused a movement against him among the industrial *bourgeoisie.*

From this time onward, in face of a growing opposition, anxiety for the future of his régime paralysed his initiative. Placed between his Italian counsellors and the empress, he was ever of two minds. His plans for remodelling Europe had a certain generosity and grandeur; but internal difficulties forced him into endless manoeuvre and temporization, which led to his ruin. Thus in October 1862, after Garibaldi's attack on Rome, the clerical coterie of the Tuileries triumphed. But the replacing of M. Thouvenel by M. Drouin de Lhuys did not satisfy the more violent Catholics, who in May 1863 joined the united opposition. Thirty-five opposers of the government were appointed, Republicans, Orleanists, Legitimists or Catholics. The emperor dismissed Persigny, and summoned moderate reformers such as Duruy and Béhic. But he was still possessed with the idea of settling his throne on a firm basis, and uniting all France in some glorious enterprise which should appeal to all parties equally, and "group them under the mantle of imperial glory." From January to June 1863 he sought this appearance of glory in Poland, but only succeeded in embroiling himself with Russia. Then, after Syria and China, it was the "great inspiration of his reign," the establishment of a Catholic and Latin empire in Mexico, enthusiasm for which he tried in vain from 1863 to 1867 to communicate to the French.

But while the strength of France was wasting away at Puebla in Mexico, Bismarck was founding German unity. In August 1864 the emperor, held back by French public opinion, which was favourable to Prussia, and by his idea of nationality, allowed Prussia and Austria to seize the duchies of Schleswig and Holstein. After his failure in Poland and Mexico and in face of the alarming presence of Germany, only one alliance remained possible for Napoleon III., namely with Italy. He obtained this by the convention of the 15th of September 1864 (involving the withdrawal of the French troops from Rome). But the Catholic party redoubled its violence, and the pope sent out the encyclical *Quanta Cura* and the *Syllabus,* especially directed against France. In vain the emperor sought in German affairs a definitive solution of the Italian question. At Biarritz he prepared with Bismarck the Franco-Prussian alliance of April 1866; and hoped to become arbiter in the tremendous conflict which was about to begin. But Königgrätz came as a bolt from the blue to ruin his hopes. French interests called for an immediate intervention. But he resigned himself to the annexation by Prussia of northern Germany. "Now," said M. Drouin de Lhuys, "we have nothing left but to weep."

The Third Party.—Henceforth the brilliant dream, a moment realized, the realization of which he had thought durable, was at an end. The Empire had still an uncertain and troubled brilliancy at the Exhibition of 1867. But Berezowski's pistol shot, which accentuated the estrangement from the tsar, and the news of the death of Maximilian at Queretaro, cast a gloom over the later fêtes. In the interior the industrial and socialist movement, born of the new industrial development, added fresh strength to the Republican and Liberal opposition. The moderate Imperialists felt that some concessions must be made to public opinion. In opposition to the absolutist "vice-emperor" Rouher, whose influence over Napoleon had become stronger and stronger since the death of Morny, Émile Ollivier grouped the Third Party. Anxious, changeable and distraught, the emperor made the Liberal

concessions of Jan. 19, 1867 (right of interpellation), and then, when Ollivier thought that his triumph was near, he exalted Rouher (July) and did not grant the promised laws concerning the press and public meetings till 1868. The opposition gave him no credit for these tardy concessions. There was an epidemic of violent attacks on the emperor; the publication of the *Lanterne* and the Baudin trial, conducted by Gambetta, were so many death-blows to the régime. The *Internationale* developed its propaganda. The election of May 1869 resulted in 4,438,000 votes given for the government, and 3,355,000 for the opposition, who also gained 90 representatives. The emperor, disappointed and hesitating, was slow to return to a parliamentary régime. It was not till December that he instructed Ollivier to "form a homogeneous cabinet representing the majority of the Corps Législatif" (ministry of the 2nd of January 1870). But, embarrassed between the *Arcadiens,* the partisans of the absolute régime, and the republicans, Ollivier was unable to guide the Empire in a constitutional course. At the Tuileries Rouher's counsel still triumphed. It was he who inspired the ill and wearied emperor, now without confidence or energy, with the idea of resorting to the *plébiscite.* "To do away with the risk of a revolution," "to place order and liberty upon a firm footing," "to ensure the transmission of the crown to his son," Napoleon III. again sought the approbation of the nation. He obtained it with brilliant success, for the last time, by 7,358,786 votes against 1,571,939, and his work now seemed to be consolidated.

War With Prussia.—A few weeks later it crumbled irrevocably. Since 1866 he had been pursuing an elusive appearance of glory. Since 1866 France was calling for "revenge." He felt that he could only rally the people to him by procuring them the satisfaction of their national pride. Hence the mishaps and imprudences of which Bismarck made such an insulting use. Hence the negotiations of Nikolsburg, the "note d'aubergiste" (innkeeper's bill) claiming the left bank of the Rhine, which was so scornfully rejected; hence the plan for the invasion of Belgium (August 1866), the Luxemburg affair (March 1867), from which M. de Moustier's diplomacy effected such a skilful retreat; hence the final folly which led his government into the war with Prussia (July 1870).

The war was from the first doomed to disaster. It might perhaps have been averted if France had had any allies. But Austria, a possible ally, could only join France if satisfied as regards Italy; and since Garibaldi had threatened Rome (Mentana, 1867), Napoleon III., yielding to the anger of the Catholics, had again sent troops to Rome. Negotiations had taken place in 1869. The emperor, bound by the Catholics, had refused to withdraw his troops. It was as a distant but inevitable consequence of his agreement of December 1848 with the Catholic party that in 1870 the emperor found himself without an ally.

His energy was now completely exhausted. Successive attacks of stone in the bladder had ruined his physique; while his hesitation and timidity increased with age. The influence of the empress over him became supreme. On leaving the council in which the war was decided upon the emperor threw himself, weeping, into the arms of Princess Mathilde. The empress was delighted at this war, which she thought would secure her son's inheritance.

Deposition.—On July 28 father and son set out for the army. They found it in a state of utter disorder, and added to the difficulties by their presence. The emperor was suffering from stone and could hardly sit his horse. After the defeat of Reichshoffen, when Bazaine was thrown back upon Metz, he wished to retreat upon Paris. But the empress represented to him that if he retreated it would mean a revolution. An advance was decided upon which ended in Sedan. On Sept. 2 Napoleon III. surrendered with 80,000 men, and on the 4th of September the Empire fell. He was taken as a prisoner to the castle of Wilhelmshöhe, near Cassel, where he stayed till the end of the war. After the intrigues of Bazaine, of Bismarck, and of the empress, the Germans having held negotiations with the Republic, he was *de facto* deposed. On March 1, the assembly of Bordeaux confirmed this deposition, and declared him "responsible for the ruin, invasion and dismemberment of France."

Restored to liberty, he retired with his wife and son to Chislehurst in England. Unwilling even now to despair of the future, he still sought to rally his friends for a fresh propaganda. He had at his service publicists such as Cassagnac, J. Amigues and Hugelmann. He himself also wrote unsigned pamphlets justifying the campaign of 1870. It may be noted that, true to his ideas, he did not attempt to throw upon others the responsibility which he had always claimed for himself. He dreamed of his son's future. But he no longer occupied himself with any definite plans. He interested himself in pensions for workmen and economical stoves. At the end of 1872 his disease became more acute, and a surgical operation became necessary. He died on Jan. 9, 1873, leaving his son in the charge of the empress and of Rouher. The young prince was educated at Woolwich from 1872 to 1875, and in 1879 took part in the English expedition against the Zulus in South Africa, in which he was killed. By his death vanished all hope of renewing the extraordinary fortune which for twenty years placed the nephew of the great emperor, the *Carbonaro* and dreamer, at once obstinate and yet hesitating, on the throne of France.

BIBLIOGRAPHY.—The *Oeuvres* of Napoleon III. have been published in four volumes (1854–57) and his *Histoire de Jules César* in two volumes (1865–69); this latter work has been translated into English by T. Wright. *See* also Ebeling, *Napoleon III. und sein Hof* (1891–94); H. Thirria, *Napoléon III. avant l'Empire* (1895); Sylvain-Blot, *Napoléon III.* (1899); Giraudeau, *Napoléon III. intime* (1895); Sir W. A. Fraser, *Napoleon III.* (London, 1895); A. NAPOLEON, a city of northwestern Ohio, U.S., on the Maumee river and federal highways 6 and 24; 36 mi. S.W. of Toledo; county seat of Henry county; served by the Detroit, Toledo and Ironton and the Wabash railways. Pop. 5,326 in 1950; 4,825 in 1940. It is the trade centre of a rich grain-growing district, is a railway division point, and has a number of factories

NAPOLEON, a round game of cards (known colloquially as "nap"). Any number may play. The cards rank as at whist, and five are dealt to each player. The deal being completed, the player to the dealer's left looks at his hand and declares how many tricks he would play to win against all the rest, the usual rule being that more than one must be declared; in default of declaring he says "I pass," and the next player has a similar option of either declaring to make more tricks or passing, and so on all round. A declaration of five tricks is called "going nap." The player who declares to make most has to try to make them, and the others, but without consultation, to prevent him. The declaring hand has the first lead, and the first card he leads makes the trump suit. The players, in rotation, must follow suit if able. If the declarer succeeds in making at least the number of tricks he stood for he wins whatever stakes are played for; if not he loses. If the player declaring nap wins he receives double stakes all round; if he loses he only pays single stakes all round. Sometimes, however, a player is allowed to go "Wellington" over "nap," and even "Blücher" over "Wellington." In these cases the caller of "Wellington" wins four times the stake and loses twice the stake, the caller of "Blücher" receives six times and loses three times the stake. Sometimes a player is allowed to declare *misère, i.e.,* no tricks. This ranks, as a declaration, between three and four, but the player pays a double stake on three, if he wins a trick, and receives a single on three if he takes none.

NAPOLEONIC CAMPAIGNS. The era of the Revolutionary and Napoleonic Wars falls into two main divisions, the first of which (1792–1801) is dealt with under the heading FRENCH REVOLUTIONARY WARS. In the present article are described the campaigns in central and eastern Europe, directed by Napoleon—no longer one amongst many French generals, nor even a simple *primus inter pares,* but "Emperor" in the fullest sense—between the years 1805 and 1814. Napoleon's short

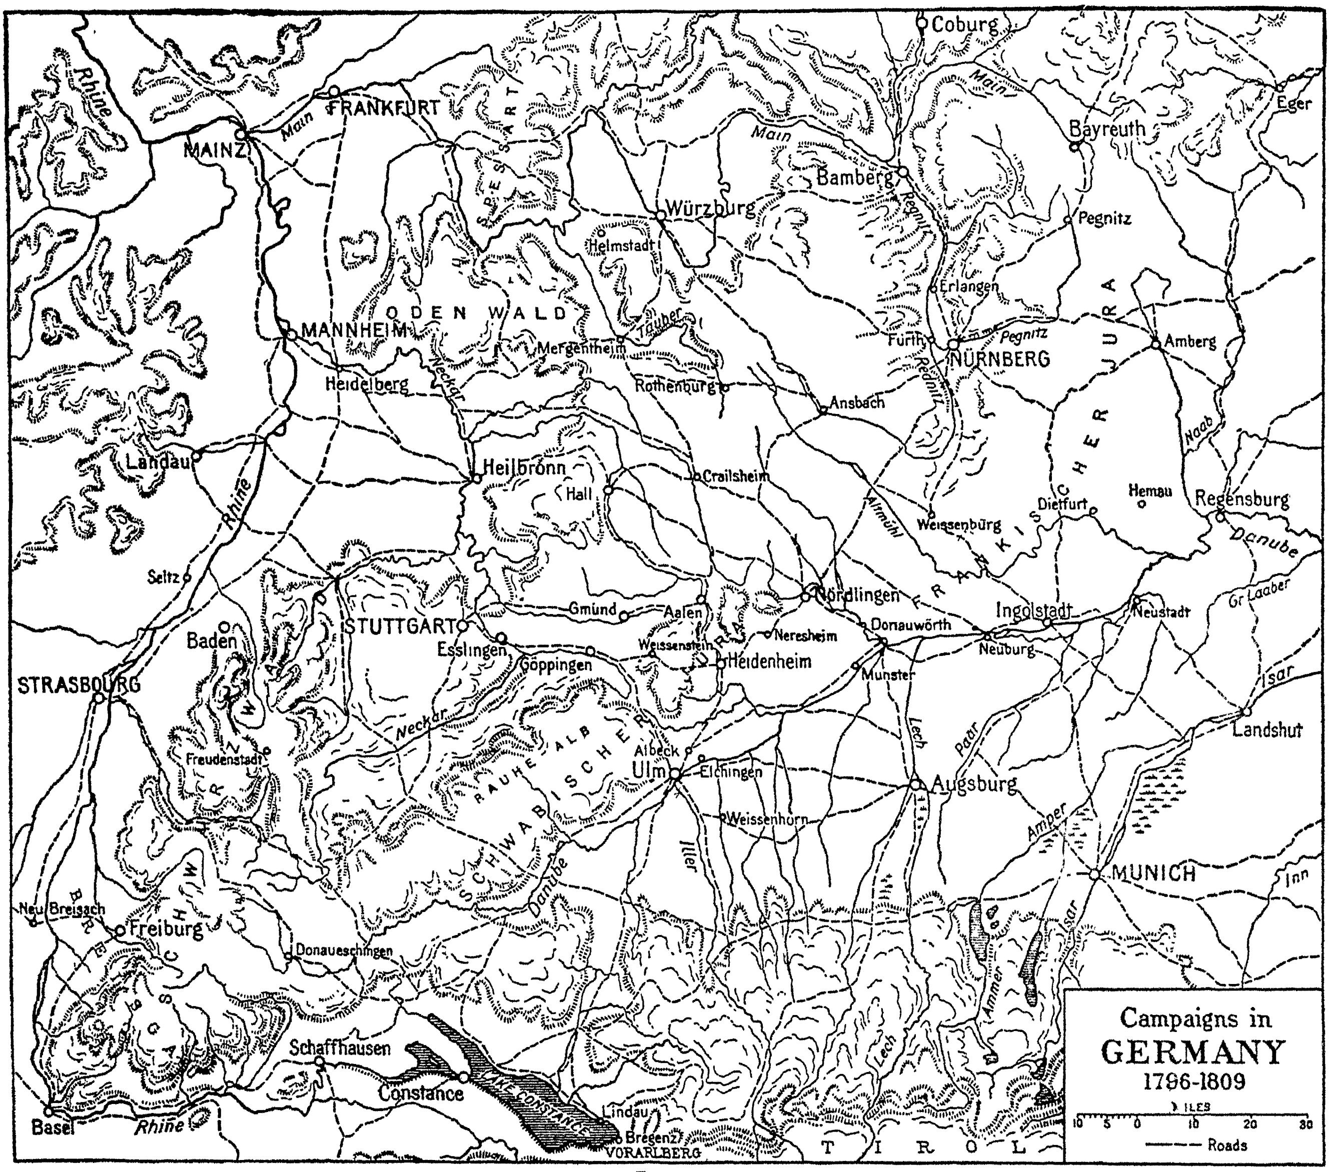

FIG. 1

Spanish Campaign of 1809 is dealt with under Peninsular War (this article covering the campaigns in Spain, Portugal and southern France 1808–1814), and for a discussion of the events that led to the final drama of Waterloo the reader is referred to Waterloo Campaign, 1815.

The campaigns described below are therefore—

(*a*) The Austrian War of 1805 (Ulm and Austerlitz).
(*b*) The Conquest of Prussia and the Polish Campaign (Jena, Auerstädt, Eylau and Friedland).
(*c*) The Austrian war of 1809 (Eckmühl, Aspern and Wagram).
(*d*) The Russian War of 1812 (Borodino and the retreat from Moscow).
(*e*) The German "War of Liberation," culminating in the Battle of the Nations around Leipzig.
(*f*) The last campaign in France, 1814.

The naval history of 1803–1815 includes the culmination and the sequel of the struggle for command of the sea which began in 1793 and continued for more than a decade with results increasingly disappointing to the ambitions of Napoleon, finally reaching a decisive climax on the day of Trafalgar.

THE CAMPAIGN OF 1805

This may be regarded as a measure of self-defence forced upon Napoleon by the alliance of Russia (April 11), Austria (August 9) and other powers with Great Britain. The possibility had long been before the emperor, and his intention in that event to march straight on Vienna by the valley of the Danube is clearly indicated in his reply (November 27, 1803) to a Prussian proposal for the neutralization of the South German states. In this he says, "It is on the road from Strasbourg to Vienna that the French must force peace on Austria, and it is this road which you wish us to renounce." When, therefore, on Aug. 25, 1805, he learnt definitely that Villeneuve (see *Naval Operations* below) had failed in his purpose of securing the command of the Channel, which was the necessary preliminary to the invasion of England, it was but the affair of a few hours to dictate the dispositions necessary to transfer his whole army to the Rhine frontier as the first step in the march which he had determined to make to the Danube. On the date of this decision the army actually lay in the following positions:—

I.	Corps	Bernadotte	Hanover (Göttingen)
II.	"	Marmont	Holland
III.	"	Davout	Camp of Boulogne and other points on the English Channel
IV.	"	Soult	
V.	"	Lannes	
VI.	"	Ney	
VII.	"	Augereau	
Guard		Bessières	Paris

The corps were, however, by no means fit for immediate service. Bernadotte's corps in Hanover was almost in the position of a

beleaguered garrison, and the marshal could only obtain his transport by giving out that he was ordered to withdraw to France. Marmont and Davout were deficient in horses for cavalry and artillery, and the troops in Boulogne, having been drawn together for the invasion of England, had hardly any transport at all, as it was considered this want could be readily supplied on landing. The composition of the army, however, was excellent. The generals were in the prime of life, had not yet learnt to distrust one another, and were accustomed to work under the emperor and with one another. The regimental officers had all acquired their rank before the enemy and knew how to manage their men, and of the men themselves nearly two-thirds had seen active service. The strength of the army lay in its infantry, for both cavalry and artillery were short of horses, and the latter had not yet acquired mobility and skill in manoeuvring. Napoleon's determination to undertake the invasion of England has often been disputed, but it is hard to imagine what other operation he contemplated, for the outbreak of hostilities with his continental enemies found him ill-supplied with intelligence as to the resources of the country he had then to traverse. To remedy this, Murat and other general officers as well as minor agents were sent ahead and instructed to travel through South Germany in plain clothes with a view to collecting information and mastering the topography. The emperor was, moreover, imperfectly acquainted with the degree of preparation of his adversaries' designs, and when he dictated his preliminary orders he was still unaware of the direction that the allies' advance would assume. On Aug. 26, however, he learnt that 100,000 Russians were about to enter Bohemia thence to unite with an Austrian army of 80,000 near the junction of the Inn and Danube, and this information drove him to alter the general direction of his advance so as to traverse the defiles of the Black Forest north of the Neckar, cavalry only observing the passes to the south.

Austrian Army.—The Austrians after the defeats of 1800 had endeavoured to reorganize their forces on the French model, but they were soon to learn that in matters of organization the spirit is everything, the letter very little. They had copied the organization of the French corps, but could find no corps commanders fit to assume the responsibility for these commands. As always in such conditions, the actual control of the smallest movements was still centralized in the hands of the army commanders, and thus the rate of marching was incredibly slow. They had decided that in future their troops in the field should live by requisition, and had handed over to the artillery, which needed them badly, a large number of horses thus set free from the transport service, but they had not realized that men accustomed to a regular distribution of rations cannot be transformed into successful marauders and pillagers by a stroke of the pen; and they had sent away the bulk of their army, 120,000 under their best general, the archduke Charles, into Italy, leaving Mack von Leiberich in Germany, nominally as chief of the staff to the young Prince Ferdinand, but virtually in command, to meet the onset of Napoleon at the head of his veterans. Mack had the distinction of having risen from the ranks in the most caste-ridden army in Europe.

The March on Ulm.—The outbreak of the campaign was hastened by the desire of the Austrian government to feed their own army and leave a bare country for Napoleon by securing the resources of Bavaria. It was also hoped that the Bavarians with their army of 25,000 men would join the allies. In the latter hope they were deceived, and the Bavarians under General Wrede slipped away to Bamberg in time. In the former, however, they were successful, and the destitution they left in their wake almost wrecked Napoleon's subsequent combinations. Mack's march to Ulm was therefore a necessity of the situation, and his continuance in this exposed position, if foolhardy against such an adversary, was at any rate the outcome of the high resolve that even if beaten he would inflict crippling losses upon the enemy. Mack knew that the Russians would be late at the rendezvous on the Inn. By constructing an entrenched camp at Ulm and concentrating all the available food within it, he expected to compel Napoleon to invest and besiege him, and he anticipated that in the devastated country his adversary would be compelled to separate and thus fall an easy prey to the Russians. For that blow he had determined to make his own army the anvil. But these views obviously could not be published in army orders, hence the discontent and opposition he was destined to encounter.

Movements of the French.—It was on Sept. 21 that Napoleon learnt of Mack's presence in Ulm. On that date his army had crossed the Rhine and was entering the defiles of the Black Forest. It was already beginning to suffer. Boots were worn out, greatcoats deficient, transport almost unattainable and, according to modern ideas, the army would have been considered incapable of action.

On Sept. 26 its deployment beyond the mountains was complete, and as Napoleon did not know of Mack's intention to stay at Ulm and had learned that the Russian advance had been delayed, he directed his columns by the following roads on the Danube, between Donauwörth and Ingolstadt, so as to be in a position to intervene between the Austrians and the Russians and beat both in detail.

	Sept. 28	Oct. 6	Oct. 9	Oct. 16
Bernadotte	Würzburg	Anspach	Nürnberg	Regensburg
Marmont	Würzburg	Anspach	Nürnberg	Regensburg
Davout .	Mannheim	Mergentheim	Anspach	Dietfurt
Ney . .	Selz	Crailsheim	Weissenburg	Ingolstadt
Lannes .	Strassburg	Gmund	Nördlingen	Neuburg
Soult .	Landau	Aalen	Donauwörth	

On Oct. 7 this movement was completed—the Austrians abandoned the Danube bridges after a show of resistance, retreating westward—and Napoleon, leaving Murat in command of the V. and VI. corps and cavalry to observe the Austrians, pressed on to Augsburg with the others so as to be ready to deal with the Russians. Learning, however, that these were still beyond striking radius, he determined to deal with Mack's army first, having formed the fixed conviction that a threat at the latter's communications would compel him to endeavour to retreat southwards towards Tirol. Bernadotte in his turn became an army of observation, and Napoleon joining Murat with the main body marched rapidly westward from the Lech towards the Iller.

Austrian Plans.—Mack's intentions were not what Napoleon supposed. He had meanwhile received (false) information of a British landing at Boulogne, and he was seriously deceived as to the numbers of Napoleon's forces. He was also aware that the exactions of the French had produced deep indignation throughout Germany and especially in Prussia whose neutrality had been violated. All this, and the almost mutinous discontent of his generals and his enemies of the court circle, shook his resolution of acting as anvil for the Russians, of whose delay also he was aware, and about Oct. 8 he determined to march out north-eastward across the French lines of communication and save his sovereign's army by taking refuge if necessary in Saxony. Believing implicitly in the rumours of a descent on Boulogne and of risings in France which also reached him, and knowing the destitution he had left behind him in his movement to Ulm, when he heard of the westward march of French columns from the Lech he told his army, apparently in all good faith, that the French were in full march for their own country.

Actually the French at this moment were suffering the most terrible distress—up to the Danube they had still found sufficient food for existence, but south of it, in the track of the Austrians, they found nothing. All march discipline disappeared, the men dissolved into hordes of marauders and even the sternest of the marshals wrote piteous appeals to the emperor for supplies, and for permission to shoot some of their stragglers. But to all these Berthier in the emperor's name sent the stereotyped reply—"The emperor has ordered you to carry four days' provisions, therefore you can expect nothing further—you know the emperor's method of conducting war."

Action of Albeck or Haslach.—Meanwhile Murat, before the emperor joined him, had given Mack the desired opening. The VI. corps (Ney) should have remained on the left bank of the

Danube to close the Austrian exit on that side, but by mistake only Dupont's division had been left at Albeck, the rest being brought over the river. Mack on the 8th had determined to commence his withdrawal, but fortune now favoured the French. The weather during the whole of October had been unusually wet, the swollen Danube overflowed the low ground and the roads had become quagmires. On the south bank, owing to better natural drainage and a drier subsoil, movement was fairly easy, but the Austrians found it almost impossible. On Oct. 11, when they began their march, the road along the Danube was swept into the river, carrying with it several guns and teams, and hours were consumed in passing the shortest distances. At length in the afternoon they suddenly fell upon Dupont's isolated division at Albeck, which was completely surprised and severely handled. The road now lay completely open, but the Austrian columns had so opened out owing to the state of the roads that the leading troops could not pursue their advantage—Dupont rallied and the Austrians had actually to fall back towards Ulm to procure food.

Elchingen.—For three more days Mack struggled with an unwilling staff and despondent men to arrange a further advance. During these very three days, through a succession of staff blunders, the French failed to close the gap, and on the morning of Oct. 14 the armies, each renewing its advance, came in contact at the bridge of Elchingen. This bridge, all but a few road-bearers, had been destroyed, but now the French gave an example of that individual gallantry which was characteristic of the old revolutionary armies. Running along the beams under a close fire a few gallant men forced their way across. The floor of the bridge was rapidly relaid, and presently the whole of the VI. corps was deploying with unexampled rapidity on the farther side. The Austrians, still in their quagmire, could not push up reinforcements fast enough, and though Mack subsequently alleged deliberate obstruction and disobedience on the part of his subordinates, the state of the roads alone suffices to explain their defeat. Only the right column of the Austrians was, however, involved; the left under General Werneck, to whom some cavalry and the archduke Ferdinand attached themselves, did indeed succeed in getting away, but without trains or supplies. They continued their march, famished but unmolested, until near Heidenheim they suddenly found themselves confronted by what from the diversity of uniforms they took to be an overwhelming force; at the same time the French cavalry sent in pursuit appeared in their rear. Utterly exhausted by fatigue, Werneck with his infantry, some 8,000 strong, surrendered to what was really a force of dismounted dragoons and foot-sore stragglers improvised by the commanding officer on the spot to protect the French treasure chests, which at that moment lay actually in the path of the Austrians. The young archduke with some cavalry escaped.

Mack Surrounded.—The defeat at Elchingen on Oct. 14 sealed the fate of the Austrians, though Mack was still determined to endure a siege. As the French columns coming up from the south and west gradually surrounded him, he drew in his troops under shelter of the fortress and its improvised entrenched camp, and on the 15th he found himself completely surrounded. On the 16th the French field-guns fired into the town, and Mack realized that his troops were no longer under sufficient control to endure a siege. When, therefore, next morning, negotiations were opened by the French, Mack, still feeling certain that the Russians were at hand, agreed to an armistice and undertook to lay down his arms if within the next twenty-one days no relief should arrive. To this Napoleon consented, but hardly had the agreement been signed when he succeeded in introducing a number of individual French soldiers into the fortress, who began rioting with the Austrian soldiery. Then, sending in armed parties to restore order and protect the inhabitants, he caused the guards at the gates to be overpowered, and Mack was thus forced into an unconditional surrender.

On Oct. 22, the day after Trafalgar, the remnant of the Austrian army, 23,000 strong, laid down its arms. About 5,000 men under Jellachich had escaped to Tirol, 2,000 cuirassiers with Prince Ferdinand to Eger in Bohemia, and about 10,000 men under Werneck had surrendered at Heidenheim. The losses in battle having been insignificant, there remain some 30,000 to account for—most of whom probably escaped individually by the help of the inhabitants, who were bitterly hostile to the French. Napoleon now hastened to rejoin the group of corps he had left under Bernadotte in observation towards the Russians, for the latter were nearer at hand than even Mack had assumed. But hearing of his misfortune they retreated before Napoleon's advance along the right bank of the Danube to Krems, where they crossed the river and withdrew to an entrenched camp near Olmütz to pick up fresh Austrian reinforcements. The severe actions of Dürrenstein (near Krems) on Nov. 11, and of Hollabrünn on Nov. 16, in which Napoleon's marshals learned the tenacity of their new opponents, and the surprise of the Vienna bridge (November 14) by the French, were the chief incidents of this period in the campaign.

Campaign of Austerlitz.—Napoleon continued down the right bank to Vienna, where he was compelled by the condition of his troops to call a halt to refit his army. After this was done he continued his movement to Brünn. Thither he succeeded in bringing only 55,000 men. He was again forced to give his army rest and shelter, under cover of Murat's cavalry. The allies now confronted him with upwards of 86,000 men, including 16,000 cavalry. About Nov. 20 this force commenced its advance, and Napoleon concentrated in such a manner that within three days he could bring over 80,000 French troops into action around Brünn, besides 17,000 or more Bavarians under Wrede. On the 28th Murat was driven in by the allied columns. That night orders were despatched for a concentration on Brünn in expectation of a collision on the following day; but hearing that the whole allied force was moving towards him he decided to concentrate south-east of Brünn, covering his front by cavalry on the Pratzen heights. Meanwhile he had also prepared a fresh line of retreat towards Bohemia, and, certain now of having his men in hand for the coming battle, he quietly awaited events.

The allies were aware of his position, and still adhering to the old "linear" system, marched to turn his right flank (*see* AUSTERLITZ). As soon as their strategic purpose of cutting him off from Vienna became apparent, the emperor moved his troops into position, and in the afternoon issued his famous proclamation to his troops, pointing out the enemy's mistakes and his plan for defeating them. At the same time he issued his orders for his first great battle as a supreme commander. The battle of Austerlitz began early next morning and closed in the evening with the thorough and decisive defeat of the allies.

PRUSSIAN AND POLISH CAMPAIGNS

Around the Prussian army, and particularly the cavalry, the prestige of Frederick the Great's glory still lingered; but the younger generation had little experience of actual warfare, and the higher commanders were quite unable to grasp the changes in tactics and in the conduct of operations which had grown out of the necessities of the French Revolution. The individual officers of the executive staff were the most highly trained in Europe, but there was no great leader to co-ordinate their energies. The total number of men assigned to the field army was 110,000 Prussians and Saxons. They were organized in corps, but their leaders were corps commanders only in name, for none were allowed any latitude for individual initiative. Ill-judged economies had undermined the whole efficiency of the Prussian army. Two-thirds of the infantry and one-half of the cavalry were allowed furlough for from ten to eleven months in the year. The men were unprovided with greatcoats. Most of the muskets had actually seen service in the Seven Years' War, and their barrels had worn so thin with constant polishing that the use of full charges at target practice had been forbidden. Above all, the army had drifted entirely out of touch with the civil population. The latter, ground down by feudal tradition and law, and at the same time permeated by the political doctrines of the late 18th century, believed that war concerned the governments only, and formed no part of the business of the "honest citizen." In this idea they were supported by the law itself, which protected the civilian against the soldier, and forbade even in war-time the requisition-

ing of horses, provisions and transport, without payment. Up to the night of the battle of Jena itself, the Prussian troops lay starving in the midst of plenty, whilst the French everywhere took what they wanted. This alone was a sufficient cause for all the misfortunes which followed.

During the campaign of Austerlitz Prussia, furious at the violation of her territory of Anspach, had mobilized, and had sent Haugwitz as ambassador to Napoleon's headquarters. He arrived on Nov. 30, and Napoleon, pleading business, put off his official reception till after the battle of Austerlitz. Of course the ultimatum was never presented, as may be imagined; Haugwitz returned and the king of Prussia demobilized at once. But Napoleon, well knowing the man he had to deal with, had determined to force a quarrel upon Prussia at the earliest convenient opportunity. His troops therefore, when withdrawn from Austria, were cantoned in south Germany in such a way that, whilst suspicion was not aroused in minds unacquainted with Napoleonic methods, they could be concentrated by a few marches behind the Thuringian forest and the upper waters of the Main. Here the Grande Armée was left to itself to recuperate and assimilate its recruits, and it is characteristic of the man and his methods that he did not trouble his corps commanders with a single order during the whole of the spring and summer.

As the diplomatic crisis approached, spies were sent into Prussia, and simultaneously with the orders for preliminary concentration the marshals received private instructions, the pith of which cannot be better expressed than in the following two quotations from Napoleon's correspondence:—

"Mon intention est de concentrer toutes mes forces sur l'extrémité de ma droite en laissant tout l'espace entre le Rhin et Bamberg entièrement dégarni, de manière à avoir près de 200,000 hommes réunis sur un même champ de bataille; mes premières marches menacent le coeur de la monarchie prussienne" (No. 10,920). "Avec cette immense supériorité de forces réunis sur un espace si étroit, vous sentez que je suis dans la volonté de ne rien hasarder et d'attaquer l'ennemi partout où il voudra tenir. Vous pensez bien que ce serait une belle affaire que de se porter sur cette place (Dresden) en *un bataillon carré de* 200,000 *hommes*" (Soult, No. 10,941).

Advance of the Grande Armée.—On Oct. 7 the *Grande Armée* lay in three parallel columns along the roads leading over the mountains to Hof, Schleiz and Kronach; on the right lay the IV. corps (Soult) about Bayreuth, with his cavalry in rear, and behind these the VI. corps (Ney) at Pegnitz; in the centre, Bernadotte's I. corps from Nordhalben, with the III. corps (Davout) Lichtenfels; Guard and headquarters, Bamberg. The left column was composed of the V. (Lannes) at Hemmendorf, with the VII. (Augereau) extending south to the Main at Burgebrach.

Napoleon's object being surprise, all the cavalry except a few vedettes were kept back behind the leading infantry columns and these latter were ordered to advance, on the signal being given, in "masses of manoeuvre," so as to crush at once any outpost resistance which was calculated upon the time required for the deployment of ordinary marching columns. This order has never since found an imitator, but deserves attentive study as a masterpiece (*see* H. Bonnal, *Manoeuvre d'Iéna*).

To meet the impending blow the Prussians had been extended in a cordon along the great road leading from Mainz to Dresden, Blücher was at Erfurt, Rüchel at Gotha, Hohenlohe at Weimar, Saxons in Dresden, with outposts along the frontier. An offensive move into Franconia was under discussion, and for this purpose the Prussian staff had commenced a lateral concentration about Weimar, Jena and Naumburg when the storm burst upon them. The emperor gathered little from the confused reports of their purposeless manoeuvres, but, secure in the midst of his "battalion square" of 200,000 men, he remained quite indifferent, well knowing that an advance straight on Berlin must force his enemy to concentrate and fight, and as they would bring at most 127,000 men on to the battlefield the result could hardly be doubtful. On Oct. 9 the cloud burst. Out of the forests which clothe the northern slopes of the Thuringer Wald the French streamed forth, easily overpowering the resistance of the Prussian outposts on the upper Saale, and once the open country was reached the cavalry under Murat trotted to the front, closely followed by Bernadotte's corps as "general advance guard." The result of the cavalry scouting was, however, unsatisfactory. On the night of the 10th, the emperor was still unaware of the position of his principal foe, and Murat with Bernadotte behind him was directed on Gera for the 11th, the remainder of the army continuing along the roads previously assigned to them.

In the meanwhile, however, the Saxons had been moving from Naumburg through Gera on Jena, Hohenlohe was near Weimar, and all the other divisions of the Prussian army had closed in a march eastwards, the idea of an offensive to the southward which Napoleon had himself attributed to them having already disappeared.

Reaching Gera at 9 A.M. Murat reported the movement of the Saxons on the previous day, but omitted to send a strong detachment in pursuit. The traces of the Saxons were lost, and Napoleon, little satisfied with his cavalry, authorized Lasalle to offer up to 6,000 frs. reward for information of the Prussian point of concentration. At 1 A.M. of the 12th Napoleon issued his orders: Murat and Bernadotte via Zeitz to Naumburg; Davout (III. corps and a dragoon division) also to Naumburg; Lannes to Jena, Augereau following; Soult to Gera.

In the meantime the Prussians were effecting their concentration. Rüchel, who with 15,000 men had been sent into the mountains as an advance guard for the projected offensive, was recalled to Weimar, which he reached on the 13th. The main body were between Weimar and Apolda during the 12th, and the Saxons duly effected their junction with Hohenlohe in the vicinity of Vierzehnheiligen, whilst the latter had withdrawn his troops, all but some outposts from Jena, to the plateau about Capellendorf, some 4m. to the N.W. The whole army, of over 120,000 men, could therefore have been concentrated against Lannes and Augereau by the afternoon of the 13th, whilst Soult could

FIG. 2.—JENA CAMPAIGN

only have intervened very late in the day, and Davout and Bernadotte were still too distant to reach the battlefield before the 14th. All the French corps, moreover, were so exhausted by their rapid marches over bad roads that the emperor actually ordered (at 1 A.M. on the 13th) a day of rest for all except Davout, Bernadotte, Lannes and Murat.

The Prussian headquarters, however, spent the 12th and 13th in idle discussion, whilst the troop commanders exerted themselves to obtain some alleviation for the suffering of their starving men. The defeats undergone by their outpost detachment had

profoundly affected the nerves of the troops, and on the afternoon of the 11th, on the false alarm of a French approach, a panic broke out in the streets of Jena, and it took all the energy of Hohenlohe and his staff to restore order. On the morning of the 12th the Saxon commanding officers approached Hohenlohe with a statement of the famishing condition of their men, and threatened to withdraw them again to Saxony. Hohenlohe pointed out that the Prussians were equally badly off, but promised to do his best to help his allies. Urgent messages were sent off to the Commissary von Goethe (the poet), at Weimar for permission to requisition food and firewood. These requests, however, remained unanswered, and the Prussians and Saxons spent the night before the battle shivering in their miserable bivouacs.

The 13th of October.—During the early morning of the 13th the reports brought to Napoleon at Gera partially cleared up the situation, though the real truth was very different from what he supposed. However, it was evident that the bulk of the Prussians lay to his left, and instructions were at once despatched to Davout to turn westward from Naumburg towards Kösen and to bring Bernadotte with him if the two were still together. The letter, however, ended with the words "but I hope he is already on his way to Dornburg." Now Bernadotte had neglected to keep the emperor informed as to his whereabouts. He was still with Davout, but, concluding that he had missed an order directing him to Dornburg, he thought to conceal his error by assuming the receipt of the order evidently alluded to in the last words, and as a result he marched towards Dornburg, and his whole corps was lost to the emperor at the crisis of the next day's battle.

On the road from Gera to Jena Napoleon was met by intelligence from Lannes announcing his occupation of Jena and the discovery of Prussian troops to the northward. Knowing the emperor's methods, he wisely restrained the ardour of his subordinates and asked for instructions whether to attack or wait. The emperor rode forward rapidly, reached Jena about 3 P.M., and with Lannes proceeded to the Landgrafenberg to reconnoitre. From this point his view was, however, restricted to the immediate foreground, and he only saw the camps of Hohenlohe's left wing. At this moment the Prussians were actually on parade and ready to move off to attack, but just then the "evil genius" of the Prussian army, Massenbach, an officer of the Headquarters Staff, rode up and claiming to speak with the authority of the king and commander-in-chief, induced Hohenlohe to order his troops back to camp. Of all this Napoleon saw nothing, but from all reports he came to the conclusion that the whole Prussian army was actually in front of him, and at once issued orders for his whole army to concentrate towards Jena, marching all night if need be. Six hours earlier his conclusion would have been correct, but early that morning the Prussian headquarters, alarmed for the safety of their line of retreat on Berlin by the presence of the French in Naumburg, decided to leave Hohenlohe and Rüchel to act as rear-guard, and with the main body to commence their retreat towards the river Unstrutt and the Eckhardtsberge where Massenbach had previously reconnoitred an "ideal" battlefield. This belief in positions was the cardinal principle of Prussian strategy in those days. The troops had accordingly commenced their march on the morning of the 13th, and now at 3 P.M. were settling down into bivouac; they were still but a short march from the decisive field.

Battle of Jena.—On the French side, Lannes' men were working their hardest, under Napoleon's personal supervision, to make a practicable road up to the Landgrafenberg, and all night long the remaining corps struggled through darkness towards the rendezvous. By daybreak on the 14th, the anniversary of Elchingen, upwards of 60,000 men stood densely packed on the narrow plateau of the mountain, whilst, below in the ravines on either flank, Soult on the right, and Augereau on the left, were getting into position. Fortunately a dense fog hid the helpless masses on the Landgrafenberg from sight of the Prussian gunners. Hohenlohe had determined to drive the French into the ravine at daybreak, but had no idea as to the numbers in front of him. For want of room, only a few Prussian battalions were sent forward, and these, delaying their advance till the fog had sufficiently lifted, were met by French skirmishers, and small columns, who rapidly overlapped their flanks and drove them back in confusion. Hohenlohe now brought up the remainder of his command, but in the meanwhile the French had poured across the neck between the Landgrafenberg and the main plateau, and the troops of Soult and Augereau were working up the ravines on either hand. In view of these troops the Prussian line, which had advanced faultlessly as if on parade, halted to prepare its bayonet attack by fire, and, once halted, it was found impossible to get them to go on again. The French, who had thrown themselves into houses, copses, etc., picked off the officers, and the flanks of the long Prussian lines swayed and got into confusion. The rival artilleries held each other too thoroughly to be able to spare attention to the infantry, whilst the Prussian cavalry, which had forgotten how to charge in masses of eighty or more squadrons, frittered away their strength in isolated efforts. By 10 A.M. the fourteen battalions which had initiated this attack were outnumbered by three to one, and drifted away from the battlefield. Their places were taken by a fresh body, but this was soon outnumbered and outflanked in its turn. By 2 P.M. the psychological moment had come, and Napoleon launched his guards and cavalry to complete the victory and initiate pursuit. Rüchel's division now arrived and made a most gallant effort to cover the retreat, but their order being broken by the torrent of fugitives, they were soon overwhelmed by the tide of the French victory and all organized resistance had ceased by 4 P.M.

Briefly summarized, the battle came to this—in four successive efforts the Prussians failed because they were locally outnumbered. This was the fault of their leaders solely, for, except for the last attack, local superiority was in each case attainable. Organization and tactics did not affect the issue directly, for the conduct of the men and their junior officers gave abundant proof that in the hands of a competent leader the "linear" principle of delivering one shattering blow would have proved superior to that of a gradual attrition of the enemy here, as on the battlefields of the Peninsula and at Waterloo, and this in spite of other defects in the training of the Prussian infantry which simultaneously caused its defeat on the neighbouring field of Auerstädt.

Battle of Auerstädt.—Here the superiority of French mobility showed its value most conclusively. Davout in obedience to his orders of the previous morning was marching over the Saale at Kösen, when his advanced guard and that of the Prussian main army came unexpectedly in contact. The latter with at least 50,000 men was marching in two columns, and ought therefore to have delivered its men into line of battle twice as fast as the French, who had to deploy from a single issue, and whose columns had opened out in the passage of the Kösen defile and the long ascent of the plateau above. But the Prussians attacked at the old regulation speed of seventy-five paces to the minute, and the French manoeuvred at the quick or double of 120 or 150. The consequence was that the French always succeeded in reinforcing their fighting line in time to avert disaster. Nevertheless by mid-day their strength was well-nigh exhausted, whilst the Prussian reserve, eighteen battalions of guards under Kalckreuth, stood intact and ready to engage. But at the critical moment the duke of Brunswick fell mortally wounded, and Scharnhorst, his chief of the staff, was at the time absent on another part of the field. Meanwhile rumours from the battlefield at Jena, magnified as usual, began to reach the staff, and these may possibly have influenced Kalckreuth, for when called upon to attack with his eighteen battalions and win the day, he declined to move without the direct order of the commander-in-chief to do so, alleging that it was the duty of a reserve to cover the retreat and he considered himself personally responsible to the king for the guards entrusted to his care. Even then the day might possibly have been saved had Blücher been able to find even twenty squadrons accustomed to gallop together, but the Prussian cavalry had been dispersed amongst the infantry commands, and at the critical moment it proved impossible for them to deliver a united and decisive attack

Seeing further efforts hopeless, Scharnhorst in the duke's name initiated the retreat and the troops withdrew north-west towards Buttelstedt almost unmolested by the French, who this day had

put forth all that was in them, and withstood victoriously the highest average punishment any troops of the new age of warfare had as yet endured. So desperate had been their resistance that the Prussians unanimously stated Davout's strength at double the actual figure. Probably no man but Davout could have got so much out of his men, but why was he left unsupported?

Bernadotte, we have seen, had marched to Dornburg, or rather to a point overlooking the ford across the Saale at the village of

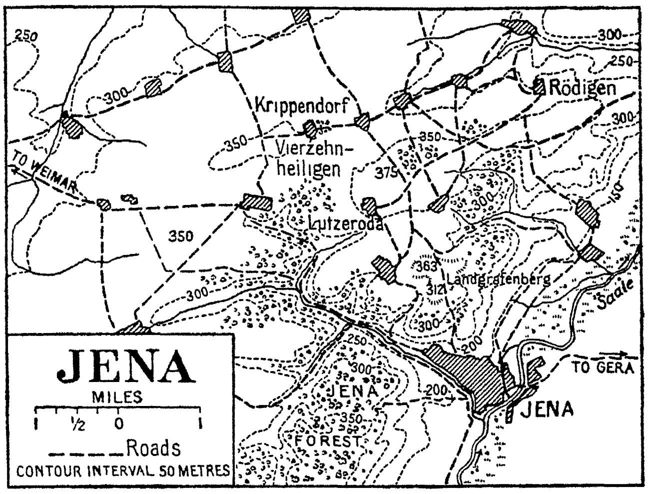

FIG. 3.—JENA

that name, and reached there in ample time to intervene on either field. But with the struggle raging before him he remained undecided, until at Jena the decision had clearly fallen, and then he crossed the river and arrived with fresh troops too late for their services to be required.

Prussian Retreat.—During the night the Prussians continued their retreat, the bulk of the main body to Sömmerda, Hohenlohe's corps towards Nordhausen. The troops had got much mixed up, but as the French did not immediately press the pursuit home, order was soon re-established and a combined retreat was begun towards the mouth of the Elbe and Lübeck. Here help was expected to arrive from England, and the tide might ultimately have turned, for the Russian armies were gathering in the east. It was now that the results of a divorce of the army from the nation began to be felt. Instead of seizing all provisions and burning what they could not remove, the Prussian generals enforced on their men the utmost forbearance towards the inhabitants, and the fact that they were obeyed, in spite of the inhumanity the people showed to their sick and wounded countrymen, proves that discipline was by no means so far gone as has generally been believed. The French marching in pursuit were received with open arms, the people even turning their own wounded out of doors to make room for their French guests. Their servility awakened the bitterest contempt of their conquerors and forms the best excuse for the unparalleled severity of the French yoke. On Oct. 26 Davout reached Berlin, having marched 166m. in twelve days including two sharp rearguard actions, Bernadotte with his fresh troops having fallen behind. The inhabitants of Berlin, headed by their mayor, came out to meet him, and the newspapers lavished adulation on the victors and abuse on the beaten army. On the 28th Murat's cavalry overtook the remnant of Prince Hohenlohe's army near Prenzlau (north of Berlin) and invited its capitulation. Unfortunately the prince sent Massenbach to discuss the situation, and the latter completely lost his head. Murat boasted that he had 100,000 men behind him, and on his return Massenbach implored his chief to submit to an unconditional surrender, advice which the prince accepted, though as a fact Murat's horses were completely exhausted and he had no infantry whatever within call. Only Blücher now remained in the field, and he too was driven at length into Lübeck with his back to the sea where he capitulated Nov. 7.

Campaigns in Poland and East Prussia.—Hitherto the French had been operating in a rich country, untouched for half a century past by the ravages of war, but as the necessity for a campaign against the Russians confronted the emperor, he realized that his whole supply and transport service must be put on a different footing. After the wants of the cavalry and artillery had been provided for, there remained but little material for transport work. Exhaustive orders to organize the necessary trains were duly issued, but the emperor seems to have had little conception of the difficulties the tracks—there were no metalled roads—of Poland were about to present to him. Moreover, it was one thing to issue orders, but quite another to ensure that they were obeyed, for they entailed a complete transformation in the mental attitude of the French soldier towards all that he had been taught to consider his duties in the field. Experience only can teach the art of packing wagons and the care of draught animals, and throughout the campaign the small ponies of Poland and East Prussia broke down by thousands from over loading and unskilful packing.

The Russian Army formed the most complete contrast to the French that it is possible to imagine. Though clad, armed and organized in European fashion, the soldiers retained in a marked degree the traditions of their Mongolian forerunners, their transport wagons were in type the survival of ages of experience, and their care for their animals equally the result of hereditary habit. The intelligence of the men and regimental officers was very low, but on the other hand service was practically for life, and the regiment the only home the great majority had ever known. Hence obedience was instinctive and initiative almost undreamt of. Moreover, they were essentially a war-trained army, for even in peace time their long marches to and fro within the empire had most thoroughly inured them to hardship and privation. Napoleon might have remembered his own saying, "La misère est l'école du bon soldat." Their artillery was numerous and for the most part of heavy calibre—18- and 24-pounders were common—but the strength of the army lay in its infantry, with its incomparable tenacity in defence and its blind confidence in the bayonet in attack. The traditions of Suvarov and his victories in Italy (*see* FRENCH REVOLUTIONARY WARS) were still fresh, but there was no longer a Suvarov to lead them.

Advance to the Vistula.—Napoleon had from the first been aware of the secret alliance between Prussia and Russia, sworn

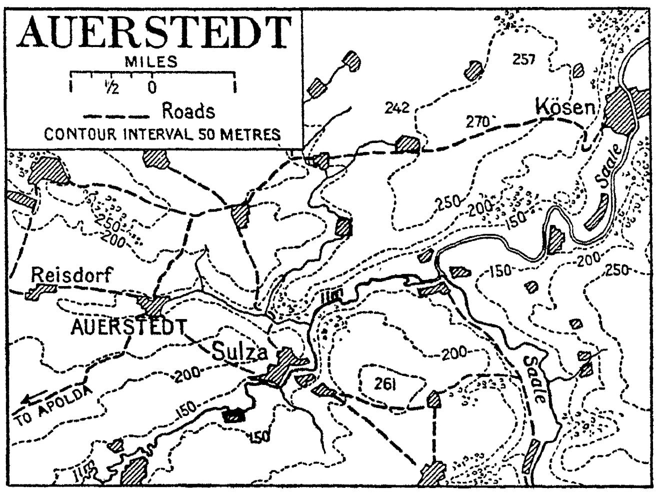

FIG. 4.—AUERSTEDT

by their respective sovereigns over the grave of Frederick the Great, and this knowledge had been his principal reason for precipitating hostilities with the former. He remained, however, in complete ignorance of the degree of preparation attained on the Russian side, and as the seizure of Warsaw together with the control of the resources of Poland in men and material its occupation would afford, was the chief factor in his calculation, he turned at once to the eastward as soon as all further organized resistance in Prussia was ended by the surrender of Prenzlau and Lübeck. Scarcely leaving his troops time to restore their worn-out foot-

gear, or for the cavalry to replace their jaded horses from captured Prussian resources, he set Davout in motion towards Warsaw on Nov. 2, and the remainder of the army followed in successive echelons as rapidly as they could be despatched.

The cavalry, moving well in advance, dispersed the Prussian depots and captured their horses, as far as the line of the Vistula, where at last they encountered organized resistance from the

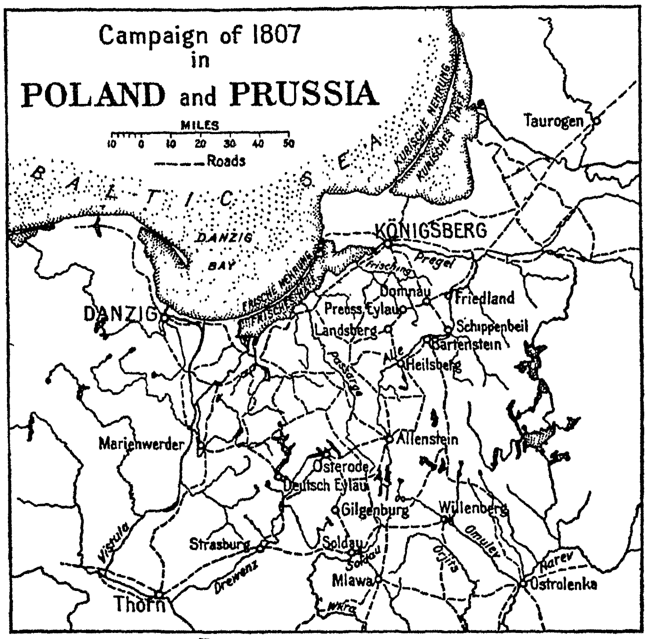

FIG. 5.—CAMPAIGN OF 1807

outposts of Lestocq's little corps of 15,000 men—all that was left of Frederick the Great's army. These, however, gave way before the threat of the advancing French and, after a few trifling skirmishes, Davout entered Warsaw on Nov. 30, being followed by the V., IV., and Guard corps during the succeeding fortnight, whilst the VI. and VII. were echeloned to their left, and the VIII. (Mortier) and IX. (Jerome Napoleon) and X. (Lefebvre), all new formations since the outbreak of the war, followed some marches in the rear. Jerome's corps was composed of the Bavarians, Württembergers and Badensers.

Behind these all Prussia was overrun by newly formed units, (3rd and 4th battalions) raised from depot companies, conscripts for 1807, and old soldiers rejoining after sickness or wounds. Napoleon caused these to be despatched to the front immediately after their formation. He had much territory to occupy, and on the long march of on an average 85 days, he considered that they could be organized, equipped and drilled *en route*.

Pultusk.—The Russians meanwhile had been moving slowly forward in two bodies, one under Bennigsen (50,000), the other under Buxhowden (25,000), and the French being at this time in Warsaw, they took up threatening positions about Pultusk, Plock and Prassnitz. From this triangle they harried the French communications with Berlin, and to secure a winter's rest for his men Napoleon determined to bring them to action. On Dec. 23 operations were commenced, but the difficulties of securing information and maintaining communication between the respective columns, so unlike what any of the French had previously encountered, led to a very partial success. The idea had been to induce the Russians to concentrate about Pultusk and, turning their position from its left, ultimately to cut them off from Russia, and if possible to surround them. But in this new and difficult country the emperor found it impossible to time his marches. The troops arrived late at their appointed positions, and after a stubborn rearguard action at Pultusk itself and undecisive fighting elsewhere (Golymin and Soldau) the Russians succeeded in retreating beyond the jaws of the French attack, and Napoleon for the first time found that he had exceeded the limit of endurance of his men. Indeed, the rank and file bluntly told him as much as he rode with the marching columns. Yielding to the inevitable, but not forgetting to announce a brilliant victory in a bulletin, he sent his troops into winter quarters along the Passarge and down the Baltic, enjoining on his corps commanders most strictly to do nothing to disturb their adversary.

Campaign of Eylau.—Bennigsen, now commanding the whole Russian army which with Lestocq's Prussians amounted to 100,000, also moved into winter quarters in the area Deutsch Eylau-Osterode-Allenstein, and had every intention of remaining there, for a fresh army was already gathering in Russia, the first corps of which had reached Nur about 50m. distant from the French right.

Unfortunately, Ney with his VI. corps about Gilgenberg had received the most poverty-stricken district in the whole region, and to secure some alleviation for the sufferings of his men he incautiously extended his cantonments till they came in contact with the Russian outposts. Apparently seeing in this movement a recommencement of hostilities, Bennigsen concentrated his troops towards his right and commenced an advance westwards towards Danzig, which was still in Prussian hands. Before his advance both Ney and Bernadotte (the latter, between Ney and the Baltic, covering the siege of Danzig) were compelled to fall back. It then became necessary to disturb the repose of the whole army to counter the enemy's intentions. The latter by this movement, however, uncovered his own communication with Russia, and the emperor was quick to seize his opportunity. He received the information on Jan. 28. His orders were at once issued and complied with so rapidly that by the 31st he stood prepared to advance with the corps of Soult, Ney, Davout and Augereau, the Guard and the reserve cavalry (80,000 men on a front of 60m.) from Myszienec through Willenberg to Gilgenberg; whilst Lannes on his right towards Ostrolenka and Lefebvre (X.) at Thorn covered his outer flanks.

Bernadotte, however, was missing, and this time through no fault of his own. His orders and the despatch conveying Napoleon's instructions fell into the hands of the Cossacks, and just in time Bennigsen's eyes were opened. Rapidly renouncing his previous intentions, he issued orders to concentrate on Allenstein; but this point was chosen too far in advance and he was anticipated by Murat and Soult at that place on Feb 2. He then determined to unite his forces at Joukendorf, but again he was too late. Soult and Murat attacked his rearguard on the 3rd, and Bennigsen, learning from his Cossacks that the French corps were designing to swing round and enclose him, he withdrew by a night march and ultimately succeeded in getting his whole army, with the exception of Lestocq's Prussians, together in the strong position along the Alle, the centre of which is marked by Preussisch-Eylau. The opportunity for this concentration Bennigsen owed to the time gained for him by his rearguard at Joukendorf, for this had stood just long enough to induce the French columns to swing in to surround it, and the next day was thus lost to the emperor as his corps had to extend again to their manoeuvring intervals. The truth is that the days were too short and the roads too bad for Napoleon to carry out the full purpose his "general advance guard" was intended to fulfil. It was designed to hold the enemy in position by the vigour of its attack, thus neutralizing his independent will power and compelling him to expend his reserves in the effort to rescue the troops engaged. But in forests and snowdrifts the French made such slow progress that no sufficient deployment could be made until darkness put a stop to the fighting. Thus, when late on Feb. 7, 1807 Murat and Soult found the enemy's rearguard near Eylau (*q.v.*) the fighting was severe but not prolonged. This time, however, Bennigsen, with over 60,000 men in position and 15,000 Prussians expected to arrive next morning, had no desire to avoid a battle, and deployed for action.

During the night Augereau and the Guards had arrived, and Ney and Davout were expected on either flank in the forenoon. This time the emperor was determined that his enemy should not escape him, and about 8 A.M. ordered Soult and Augereau on the left and right respectively to assail the enemy, Murat and the Guards remaining in the centre as reserve. Napoleon's own forces thus became the "general advance guard" for Ney and

Davout, who were to close in on either side and deliver the decisive stroke. But here too the weather and the state of the roads operated adversely, for Ney came up too late, while Davout, in the full tide of his victorious advance, was checked by the arrival of Lestocq, whose corps Ney had failed to intercept, and the attack of Augereau's corps (VII), made in a blinding snowstorm, failed with appalling loss. Bennigsen, however, drew off on Ney's arrival, and the French were too much exhausted to pursue him. Again the emperor had to admit that his troops could do no more, and, bowing to necessity, he distributed them into winter quarters, where, however, the enterprise of the Cossacks, who were no strangers to snow and to forests, left the outposts but little repose. A protracted period of rest followed, during which the emperor exerted himself unremittingly to re-equip, reinforce and supply his troops. Hitherto he had been based on the entrenched camp of Warsaw, but he had already taken steps to organize a new line of supply and retreat via Thorn, and this was now completed. At the same time Lefebvre was ordered to press the siege of Danzig with all vigour, and on May 5, after a most gallant resistance, Kalckreuth, who redeemed here his failure of Auerstädt, surrendered. English assistance came too late. By the beginning of June the French had more than made good their losses and 210,000 men were available for field service.

Heilsberg and Friedland.—Meanwhile Bennigsen had prepared for a fresh undertaking, and leaving Lestocq with 20,000 Prussians and Russians to contain Bernadotte, who lay between Braunsberg and Spandau on the Passarge, he moved southward on June 2, and on June 3 and 4 he fell upon Ney, driving him back toward Guttstadt, while with the bulk of his force he moved toward Heilsberg, where he threw up an entrenched position. It was not till June 5 that Napoleon received tidings of his advance, and for the moment these were so vague that he contented himself by warning the remainder of his forces to be prepared to move on June 6. Next day, however, all doubts were set at rest, and as the Russians advanced south of Heilsberg, he decided to wheel his whole force to the right, pivoting on the III corps, and cut Bennigsen off from Königsberg and the sea. On June 8 the VI, III, VIII and Guard corps, together with a new cavalry reserve corps under Lannes, in all 147,000, stood ready for the operation, and with Murat and Soult as general advanced guard the whole moved forward, driving the Russian outposts before them. Bernadotte, who was to have attacked Lestocq, again failed to receive his orders and took no part in the following operations.

Murat attacked the Russians, who had halted in their entrenched position, on June 11 and drove in their outposts, but did not discover the entrenchments. Meanwhile, Soult had followed with his infantry in close support, and, the emperor himself arriving, ordered him to attack at once. Now the Russians uncovered their entrenchments, and in the absence of artillery preparation Soult's leading troops received most severe punishment. Fresh troops arriving were sent in to his support, but these also proved insufficient, and darkness alone put an end to the struggle, which cost the French 12,000 killed and wounded.

Bennigsen, however, learning that his right was threatened by the III corps, and not having as yet completed his concentration, retreated in the night to Bartenstein, and the following day turned sharp right toward Schippenbeil. The emperor now pressed on toward Friedland, where he would completely control the Russian communications with Königsberg, their immediate base of supply, but for once the Russians outmarched him and covered their movement so successfully that for the next three days he seems to have completely lost all knowledge of his enemy's whereabouts. Lestocq in the meantime had been forced northward toward Königsberg, and Soult with Murat was in hot pursuit. The III, VI, VIII and Guard corps followed the main road toward Königsberg, and the former had reached Mühlhausen and the remainder were about Preussich-Eylau, when Latour Maubourg's dragoons sent in intelligence which pointed to the presence of Bennigsen about Friedland. This was indeed the case. The Russians after passing Schippenbeil had suddenly turned northward, and on the evening of June 13 were taking up a strong position on the river Alle with Friedland as a centre.

What followed presents perhaps the finest instance of the Napoleonic method. The enemy lay directly to his right, and Murat, the IV and III corps had well overshot the mark. Lannes's reserve corps (cavalry), to whom Latour Maubourg reported, lay at Domnau about 10 mi. to the right. The latter at once assumed the role of advanced guard cavalry and was ordered to observe the enemy at Friedland, Ney following in close support. Davout was turned about and directed on the enemy's right, and the VIII corps (Mortier), the Guards and the reserve cavalry followed as main body. On June 14 (the anniversary of Marengo) Lannes carried out his role of fighting advanced guard or screen, the emperor's main body gradually came up, and the battle of Friedland (*q.v.*), notable chiefly for the first display of the new artillery tactics of the French, ended with a general attack about 5 P.M. and the retreat of the Russians, after severe losses, over the Alle. Lestocq was, meanwhile, driven through Königsberg (which surrendered on June 15) on Tilsit, and now that he was no longer supported by the Russians, the Prussian commander gave up the struggle.

THE AUSTRIAN WAR OF 1809

Ever since Austerlitz the Austrian officers had been labouring to reconstitute and reform their army. Much had been done to create an efficient staff, but though the idea of the army corps command was now no new thing, the senior generals entrusted with these commands were far from having acquired the independence and initiative of their French opponents. Hence the extraordinary slowness of their manoeuvres, not because the Austrian infantrymen were bad marchers, but because the preparation and circulation of orders were still far behind the French standard. The infantry adopted the highly manoeuvrable formations of the French—skirmishers and columns—but it was easier to adopt the formations than to acquire the initiative which gave these their vital energy. The light cavalry had been much improved and the heavy cavalry on the whole proved a fair match for their opponents.

After the peace of Tilsit the *Grande Armée* was gradually withdrawn behind the Rhine, leaving only three commands, totalling 63,000 men, under Davout in Prussia, Oudinot in west central Germany and Lefebvre in Bavaria, to assist the princes of the Confederation of the Rhine in the maintenance of order and the enforcement of the French law of conscription, which was rigorously insisted on in all the states comprised in this new federation. In exchange for the subsistence of the French troops of occupation, a corresponding number of these new levies were moved to the south of France, where they commenced to arrive at the moment when the situation in Spain became acute. The Peninsular War (*q.v.*) called for large forces of the old *Grande Armée* and for a brief period Napoleon directed operations in person; and the Austrians took advantage of the dissemination and weakness of the French forces in Germany to push forward their own preparations with renewed energy.

But they reckoned without the resourcefulness of Napoleon. The moment news of their activity reached him, while still in pursuit of Sir John Moore, he dispatched letters to all the members of the confederation warning them that their contingents might soon be required, and at the same time issued a series of decrees to General Clarke, his war minister, authorizing him to call up the contingent of 1810 in advance, and directing him in detail to proceed with the formation of 4th and 5th battalions for all the regiments across the Rhine. By these means Davout's, Oudinot's and Lefebvre's commands were augmented, while in February and March new corps were formed and rapidly pushed toward the front.

On his return from Spain, seeing war imminent, he issued a series of march orders (which deserve the closest study in detail) by which on April 15 his whole army was to be concentrated for manoeuvres between Regensburg, Landshut, Augsburg and Donauwörth, and sending on the Guard in wagons to Strasbourg, he despatched Berthier to act as commander in chief until his

own arrival.

Austrian Offensive.—The position of assembly was excellently chosen, but unfortunately the Austrians took the initiative. On April 9 their main body of six corps crossed the Inn between Braunau and Passau and simultaneously two additional corps moved from Pilsen in Bohemia on Regensburg. At this moment Davout was entering Regensburg with his leading troops, the remainder still some marches in rear, and it was evident that the whole concentration could no longer be carried out before the Austrians would be in a position to intervene. Berthier received the news while still on his way to the front, and quite failed to grasp the situation. Reaching Donauwörth at 8 P.M. on April 13, he ordered Davout and Oudinot to remain at Regensburg, whilst Lefebvre and Wrede (Bavarians) who had fallen back before the Austrians were directed to reoccupy Landshut. This was in direct contradiction to the instructions Napoleon had given on March 28 in view of this very emergency. Davout obeyed, but remonstrated. On the 16th Berthier went on to Augsburg, where he learned that Lefebvre's advanced troops had been driven out of Landshut, thus opening a great gap seventy-six miles wide between the two wings of the French army. Meanwhile Napoleon, who had left Paris at 4 A.M. on April 13, was hastening towards the front, but remained still in ignorance of Berthier's doings until on the 16th at Stuttgart he received a letter from the Marshal dated the 13th, which threw him into consternation. In reply he immediately wrote: "You do not inform me what has rendered necessary such an extraordinary measure which weakens and divides my troops" —and—"I cannot quite grasp the meaning of your letter yet, I should have preferred to see my army concentrated between Ingolstadt and Augsburg, the Bavarians in the first line, with the duke of Danzig in his old position, until we know what the enemy is going to do. Everything would be excellent if the duke of Auerstädt had been at Ingolstadt and the duke of Rivoli with the Württembergers and Oudinot's corps at Augsburg, . . . so that just the opposite of what should have been done has been done" (C. N. to Berthier, Ludwigsburg, 16th April).

Napoleon Takes Command.—Having despatched this severe reprimand he hastened on to Donauwörth, where he arrived at 4 A.M. on the 17th, hoping to find Berthier, but the latter was at Augsburg. Nevertheless, at 10 A.M. he ordered Davout and Oudinot to withdraw at once to Ingolstadt; and Lefebvre and Wrede on the right to support the movement. About noon Berthier returned and after hearing his explanation Masséna received orders to move from Augsburg toward Ingolstadt. "To-morrow will be a day of preparation spent in drawing closer together, and I expect to be able by Wednesday to manoeuvre against the enemy's columns according to circumstances."

Meanwhile the Austrians had approached so near that by a single day's march it would have been possible to fall upon and crush by superior numbers either wing of the French army, but though the Austrian light cavalry successfully covered the operations of the following troops they had not yet risen to a conception of their reconnoitring mission, and the archduke, in ignorance of his opportunity and possessed, moreover, with the preconceived idea of uniting at Regensburg with the two corps coming from Bohemia, moved the bulk of his forces in that direction, leaving only a covering body against Davout altogether insufficient to retain him. Davout, however, had left a garrison of 1,800 men in Regensburg, who delayed the junction of the Austrian wings until the 20th inst., and on the same day the emperor, having now reunited his whole right wing and centre, overwhelmed the covering detachments facing him in a long series of disconnected engagements lasting forty-eight hours, and the archduke now found himself in danger of being forced back into the Danube. But with the Bohemian reinforcements he had still four corps in hand, and Napoleon, whose intelligence service in the difficult and intersected country had lamentably failed him, had weakened his army by detaching a portion of his force in pursuit of the beaten right wing, and against the archduke's communications.

Eckmühl.—When, therefore, the latter, on the 22nd, marched southward to reopen his communications by the defeat of the enemy's army, he actually reached the neighbourhood of Eckmühl with a sufficient numerical superority had he only been prompt enough to seize his opportunity. But the French had been beforehand with him. Napoleon, who had personally taken part in the fighting of the previous day, and followed the pursuit as far as Landshut, whence he had despatched Masséna to follow the retreating Austrians along the Isar, seems to have realized about

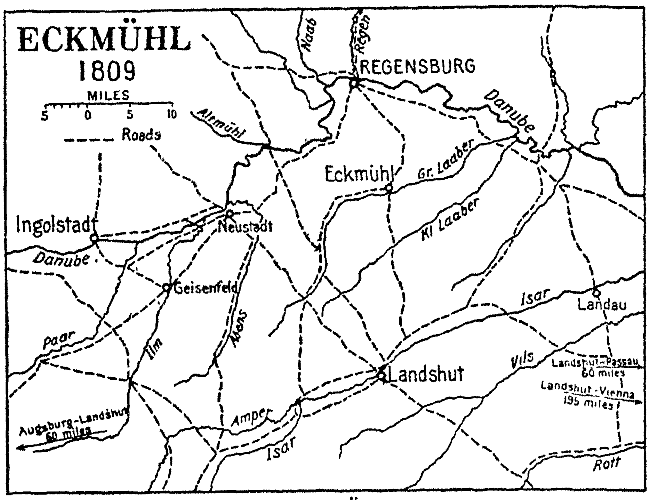

FIG. 6.—ECKMÜHL, 1809

3 A.M. in the morning that it was not the main body of the enemy he had had before him, but only its left wing, and that the main body itself must still be northward towards Regensburg. Issuing orders to Davout, Oudinot and his cavalry to concentrate with all speed towards Eckmühl, he himself rode back along the Regensburg road and reached the battle-field just as the engagement between the advance troops had commenced. Had the Austrians possessed mobility equal to that of the French the latter should have been overwhelmed in detail, but whilst the French covered 17 and 19m. the Austrians only marched 10, and, owing to their defective assimilation of the new tactical training the troops actually on the ground could not hold out long enough for their reserves to arrive. The retreat of the front lines involved the following ones in confusion, and presently the whole mass was driven back in considerable disorder. It seemed as if nothing could save the Austrians from complete disaster, but at the critical moment the emperor, yielding to the protestations of his corps commanders, who represented the excessive fatigue of their troops, stopped the pursuit, and the archduke made the most of his opportunity to restore order amongst his demoralized men and crossed to the north bank of the Danube during the night.

On the following morning the French reached Regensburg and at once proceeded to assault its mediaeval walls, but the Austrian garrison bravely defended it till the last of the stragglers was safely across on the north bank. It was here that, for the only time in his career, Napoleon was slightly wounded. Then, leaving Davout to observe the archduke's retreat, the emperor himself rode after Masséna, who with the major portion of the French army was following the Austrian weaker wing under Hiller. The latter was not so shaken as Napoleon believed, and turning at bay at Ebelsberg inflicted a severe check on its pursuers. Thus covered by his rearguard Hiller gained space and time to pass his troops over to the north bank of the Danube and remove all boats on the river. This left the direct road to Vienna open, and Napoleon, hoping to find peace in the enemy's capital, pushed the whole of his army down the right bank, and with Murat's cavalry entered the city on May 12, after somewhat severe resistance lasting three days. Meanwhile the archduke and Hiller, both now unmolested, effected their junction in the vicinity of Wagram, picketing the whole line of the Danube with their outposts and collecting all the boats.

Aspern and Wagram.—The reconnaissance of the river was at once taken in hand by the French upon their arrival in Vienna, and a point opposite the island of Lobau selected for the crossing.

Thanks to the Austrian precautions it took four days to collect the necessary material to span the main branch of the river, here some 2,000yd. across, and though Napoleon personally spurred on all to activity nearly four days more were required for its construction. It was not till the night of May 19 that orders for the passage were finally issued, and during the night the troops commenced to occupy the island of Lobau. Surprise, of course, was out of the question, but the Austrians did not attempt to dispute the passage, their object being to allow as many French as they felt they could deal with to pass over and then to fall on them. Thus on May 21 the battle of Aspern (*q.v.*) or Essling began. It ended on the night of the 22nd with the defeat of Napoleon, the first ever inflicted upon him. The French retreated into the island of Lobau. By nightfall upwards of 100,000 men, encumbered with at least 20,000 wounded, were crowded together on the little island scarcely a mile square, short of provisions and entirely destitute of course of all hospital accessories. The question then arose whether the retreat was to be continued across the main stream or not, and for the second time in his career Napoleon assembled his generals to take their opinion. They counselled retreat, but having heard them all he replied, in substance: "If we leave here at all we may as well retire to Strassburg, for unless the enemy is held by the threat of further operations he will be free to strike at our communications and has a shorter distance to go. We must remain here and renew operations as soon as possible."

Immediate orders were despatched to summon every available body of troops to concentrate for the decisive stroke. Practically the lines of communication along the Danube were denuded of combatants, even Bernadotte being called up from Passau, and the viceroy of Italy, who driving the archduke Johann before him (action of Raab) had brought up 56,000 men through Tirol, was disposed towards Pressburg within easy call. The arsenal of Vienna was ransacked for guns, stores and appliances, and preparations in the island pushed on as fast as possible. By the end of June 200,000 troops were stationed within call, and on July 4 the French began to cross over to the left bank of the Danube. The events which followed are described under WAGRAM. The great battle at this place, fought on July 5 and 6, ended in the retirement of the Austrians. The only other event which occurred before peace was made was an unimportant action at Znaym on July 11.

THE RUSSIAN WAR OF 1812

Whilst the campaign of 1809 had shaken the faith of the marshals and the higher ranks in the infallibility of the emperor's judgment, and the slaughter of the troops at Aspern and Wagram had still further accentuated the opposition of the French people to conscription, the result on the fighting discipline of the army had, on the whole, been for good. The panics of Wagram had taught men and officers alike a salutary lesson. Aware of the growing feeling against war in France, Napoleon had determined to make his allies not only bear the expenses of the coming campaign, but find the men as well, and he was so far master of Europe that of the 363,000 who on June 24 crossed the Niemen no less than two-thirds were Germans, Austrians, Poles or Italians. But though the battlefield discipline of the men was better, the discipline in camp and on the march was worse, for the troops were no longer eager to reach the battlefield, and marched because they were compelled, not of their own goodwill. The result was apparent in a sudden diminution in mobility, and a general want of punctuality which seriously influenced the course of the campaign. On the other hand, the Russians, once their fatherland was invaded, became dominated by an ever-growing spirit of fanaticism, and they were by nature too obedient to their natural leaders, and too well inured to the hardships of campaigning, to lose their courage in a retreat.

By the middle of June 1812 the emperor had assembled his army along the line of the Niemen. On the extreme right stood the Austrian contingent under Schwarzenberg (34,000 men). Next, centring about Warsaw, a group of three corps (70,000 men) under the chief command of Napoleon's brother Jerome. Then the main army under Napoleon in person (220,000 men; with 80,000 more under the viceroy of Italy on his right rear); and on the extreme left at Tilsit a flanking corps, comprising the Prussian auxiliary corps and other Germans (in all 40,000 strong). The whole army was particularly strong in cavalry; out of the 450,000, 80,000 belonged to that arm, and Napoleon, mindful of the lessons of 1807, had issued the most minute and detailed orders for the supply service in all its branches, and the forwarding of reinforcements, no less than 100,000 men being destined for that purpose in due course of time.

Information about the Russians was very indifferent; it was only known that Prince Bagration (with 43,000 men) lay grouped about Wolkowysk; Barclay de Tolly (who had about 130,000) about Vilna; and on the Austrian frontier lay a small corps under Tormassov (40,000) in process of formation, while far away on the Turkish frontiers hostilities with the sultan retained Tschitschagov with 50,000 more. Of the enemy's plans Napoleon knew nothing, but, in accordance with his usual practice, the dispositions he had chosen met all immediate possible moves.

Opening of the Campaign.—On June 24 the passage of the Niemen began in torrid heat which lasted for a few days. The main army, with the emperor in person, covered by Murat and the cavalry, moved on Vilna, whilst Jerome on his right rear at once threatened Bagration and covered the emperor's outer flank. From the very first, however, the inherent weakness of the vast army, and the vicious choice of time for the beginning of the advance, began to make themselves felt With crops still green, and nothing else available as forage for the horses, an epidemic of colic broke out amongst them, and in ten days the mounted arms had lost upwards of one-third of their strength; men died of sunstroke in numbers, and serious straggling began. Still everything pointed to the concentration of the Russians at Vilna, and Jerome, who on July 5 had reached Grodno, was ordered to push on. But Jerome proved quite inadequate to his position, listening to the complaints of his subordinates as to want of supplies and even of pay; he spent four whole days in absolute inertia, notwithstanding the emperor's reprimands. Meanwhile the Russians covered by stubborn rearguards made good their retreat—Barclay towards the entrenched camp of Drissa on the Dvina, Bagration towards Mohilev.

The emperor's first great *coup* thus failed. Jerome was replaced by Davout, and the army resumed its march, this time in the hope of surrounding and overwhelming Barclay, whilst Davout dealt with Bagration. The want of mobility, particularly in the cavalry,

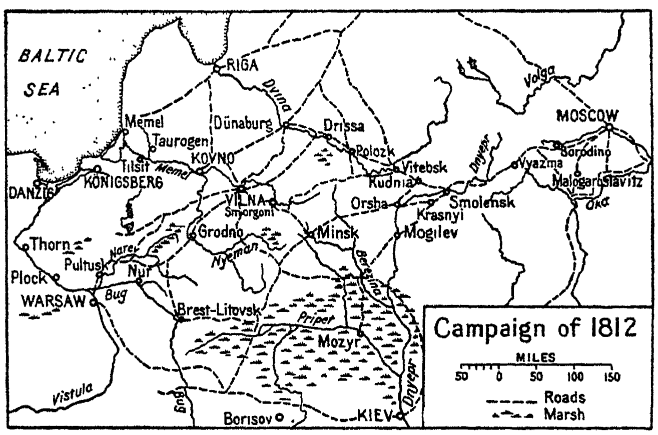

FIG. 7.—CAMPAIGN OF 1812

now began to tell against the French. With horses only just recovering from an epidemic, they proved quite unequal to the task of catching the Cossacks, who swarmed round them in every direction, never accepting an engagement but compelling a constant watchfulness for which nothing in their previous experience had sufficiently prepared the French.

Before their advance, however, the Russian armies steadily retired, Barclay from Vilna via Drissa to Vitebsk, Bagration—narrowly evading Davout—from Wolkowysk to Mohilev. Again arrangements were made for a Napoleonic battle; behind Murat's

cavalry came the "general advanced guard" to attack and hold the enemy, whilst the main body and Davout were held available to swing in on his rear. Napoleon, however, failed to allow for the psychology of his opponents, who refused to be drawn into engagements and steadily withdrew from every position when the French gained touch with them. Thus the manoeuvre against Vitebsk again miscarried, and Napoleon found himself in a far worse position, numerically and materially, than at the outset of the campaign. Then he had stood with 420,000 men on a front of 160m., now he had only 229,000 men on a 135m. front; he had missed three great opportunities of destroying his enemy in detail, and in five weeks, during which time he had only traversed 200m., he had seen his troops reduced numerically at least one-third, and, worse still, his army was now far from being the fighting machine it had been at the outset.

Meanwhile the Russians had not lost a single gun and the *moral* of their men had been improved by the result of the many minor encounters with the enemy; further, the junction of Bagration and Barclay was now assured in the vicinity of Smolensk. Towards this place the French advance was now resumed, and the Russian generals at the head of a united force of 130,000 men marched forward towards Rudnia to meet them. Here, however, the inefficiency of the Russian staff actually saved them from the disaster which must certainly have overtaken them had they realized their intention of fighting the French. The Russians marched in two columns, which lost touch of one another, and as it was quite impossible for either to engage the French single-handed, they both retired again towards Smolensk, where with an advanced guard in the town itself—which possessed an old-fashioned brick *enceinte* not to be breached by field artillery alone—the two columns reunited and deployed for action behind the unfordable Dnieper.

Murat and Ney as "general advanced guard" attacked the town in the morning of Aug. 16, and the main body was swung round to place itself on the Russian rear astride the road to Moscow. The whole of the 17th was required to complete the movement, and as soon as its purpose was sufficiently revealed to the Russians the latter determined to retreat under cover of night. Their manoeuvre was carried out with complete success, and then began a series of rearguard actions and nocturnal retreats which completely accomplished their purpose of wearing down the French army. The Russian government, however, failed to see the matter in its true light, and Marshal Kutusov was sent to the front to assume the chief command. His intention was to occupy a strong position and fight one general action for the possession of Moscow, and to this end he selected the line of the Kalatscha where the stream intersects the great Moscow road.

Borodino.—Here he was overtaken by Murat and Ney, but the French columns had straggled so badly that four whole days elapsed before the emperor was able to concentrate his army for battle and then could only oppose 128,000 men to the Russians' 110,000. About 6 A.M. on Sept. 7 the battle (*see* BORODINO) began, but Napoleon was suffering from one of those attacks of illness and depression which henceforth became such an important factor in his fate. Till about midday he followed the course of the action with his usual alertness; then he appears to have been overcome by a kind of stupor and allowed his marshals to fight by themselves. There was no final decisive effort as at Wagram and the Guard was not even called on to move. Ultimately the sun went down on an undecided field on which 38,000 Russians and 25,000 French had fallen, but the moral reaction on the latter was far greater than on the former. Kutusov continued his retreat, and Murat with his now exhausted horsemen followed as best he might. Sebastiani, commanding the advanced guard, overtook the Russians in the act of evacuating Moscow, and agreed with the latter to observe a seven hours' armistice to allow the Russians to clear the town, for experience had shown the French that street fighting in wooden Russian townships always meant fire and the consequent destruction of much-needed shelter and provisions. Towards nightfall Napoleon reached the scene, and the Russians being now clear the troops began to enter, but already fires were observed in the farther part of the city. Napoleon passed the night in a house in the western suburb and next morning rode to the Kremlin, the troops moving to the quarters assigned to them, but in the afternoon a great fire began and, continuing for two days, drove the French out into the country again.

The emperor was now in the direst perplexity. Kutusov was hovering on the outskirts of the city, his main body at Kaluga, some marches to the south-west, where he was in full communication with the richest portion of the empire; and now news arrived that St. Cyr, who had relieved Macdonald on his extreme left, had only 17,000 men left under arms against upwards of 40,000 Russians under Witgenstein; and to the south Tschitschagov's army, being no longer detained on the Turkish frontier, where peace had been made, was marching to join Tormassov about Brest-Litovsk with forces which would bring the total of the two well over 100,000 men. Meanwhile Schwarzenberg's force opposing these had dwindled to a bare 30,000.

The French army was thus disposed almost in an equilateral triangle with sides of about 570m., with 95,000 men at the apex at Moscow opposed to 120,000, 30,000 about Brest opposite 100,000, and 17,000 about Drissa confronted by 40,000, whilst in the centre of the base at Smolensk lay Victor's corps, about 30,000. From Moscow to the Niemen was 550 miles. In view of this situation Napoleon on Oct. 4 sent General Lauriston to the Russian headquarters to treat. While waiting his return Murat was enjoined to skirmish with Kutusov, and the emperor himself worked out a scheme to assume the offensive with his whole army towards St. Petersburg, calling in Victor and St. Cyr on the way. This project was persisted with, until on the 18th Murat was himself attacked and severely handled (action of Tarutino or Vinkovo). On the morning of the 19th the whole army moved out to accept this challenge, and the French were thoroughly worsted on the 24th in the battle of Maloyaroslavetz.

The Retreat from Moscow.—Then began the celebrated retreat. It has generally been forgotten that the utter want of march discipline in the French, and not the climatic conditions, was responsible for the appalling disasters which ensued. Actually the frost came later than usual that year, Oct. 27, and the weather was dry and bracing; not till Nov. 8 did the cold at night become sharp. Even when the Beresina was reached on Nov. 26, the cold was far from severe, for the slow and sluggish stream was not frozen over, as is proved by the fact that Eblé's pioneers worked in the water all through that terrible day. But the French army was already completely out of hand, and the degree to which the panic of a crowd can master even the strongest instinct of the individual is shown by the conduct of the fugitives who crowded over the bridges, treading hundreds under foot, whilst all the time the river was easily fordable and mounted men rode backwards and forwards across it.

To return to the actual sequence of events. Kutusov had been very slow in exploiting his success of the 24th and indeed had begun the pursuit in a false direction; but about Nov. 2, headquarters of the French being at Vyazma, the Cossacks became so threatening that the emperor ordered the army to march (as in Egypt) in hollow square. This order, however, appears only to have been obeyed by the Guards, with whom henceforward the emperor marched.

Kutusov had now overtaken the French, but fortunately for them he made no effort to close with them, but hung on their flank, molesting them with Cossacks and picking up stragglers. Thus the wreck of the *Grande Armée,* now not more than fifty thousand strong, reached Smolensk on the 9th and there rested till the 14th. The march was then resumed, the Guard leading and Ney commanding the rearguard. Near Krasnoi on the 16th the Russian advanced guard tried to head the column off. Napoleon halted a whole day to let the army close up; and then attacked with his old vigour and succeeded in clearing the road, but only at the cost of leaving Ney and the rearguard to its fate. By a night march of unexampled daring and difficulty Ney succeeded in breaking through the Russian cordon, but when he regained touch with the main body at Orcha only 800 of his 6,000 men were still with him (21st).

The Beresina.—From here Napoleon despatched orders to Victor to join him at Borisov on the Beresina. The cold now gave

way and thaw set in, leaving the country a morass, and information came that Tschitschagov from the south had reached Borisov. He now selected Viesselovo as the point of passage and at 1 A.M. on the 23rd sent orders to Oudinot to march thither and construct bridges. In the execution of these orders Oudinot encountered the Russian advanced guard near Borisov and drove the latter back in confusion, though not before they had destroyed the existing bridge there. This sudden reassumption of the offensive threw Tschitschagov into confusion. Thus time was gained for Victor also to come up and for Oudinot to construct the bridges at Studienka near the above-mentioned place, but a spot in many respects better suited for the purpose. Thither therefore Napoleon sent his pontonniers under General Eblé, but on their arrival they found that no preparations had been made and much time was lost. Meanwhile Victor, in doubt as to the real point of passage, had left the road to Studienka open to Wittgenstein, who had followed hard on his heels.

By 4 P.M. on the 26th the bridges were finished and the passage began, but not without resistance by the Russians, who were gradually closing in. The crossing continued all night, though interrupted from time to time by failures of the bridges. All day during the 27th stragglers continued to cross, covered by such combatants as remained under sufficient discipline to be employed. At 8 A.M. on the 28th, however, Tschitschagov and Wittgenstein moved forward on both banks of the river to the attack, but were held off by the splendid self-sacrifice of the few remaining troops under Ney, Oudinot and Victor, until about 1 P.M. the last body of regular troops passed over the bridges, and only a few thousand stragglers remained beyond the river.

The number of troops engaged by the French that day cannot be given exactly. Oudinot's and Victor's men were relatively fresh and may have totalled 20,000, whilst Ney can hardly have had more than 6,000 of all corps fighting under him. How many were killed can never be known, but three days later the total number of men reported fit for duty had fallen to 8,800 only.

Final Operations.—Henceforward the retreat of the army became practically a headlong flight, and on Dec. 8, having reached Smorgoni and seeing that nothing further could be done by him at the front, the emperor handed over the command of what remained to Murat, and left for Paris to organize a fresh army for the following year. Travelling at the fullest speed, he reached the Tuileries on the 18th, after a journey of 312 hours. After the emperor's departure the cold set in with increased severity, the thermometer falling to 23°. On Dec. 8, Murat reached Vilna, whilst Ney with about 400 men and Wrede with 2,000 Bavarians still formed the rearguard; but it was quite impossible to carry out Napoleon's instructions to go into winter quarters about the town, so that the retreat was resumed on the 10th and ultimately Königsberg was attained on Dec. 19 by Murat with 400 Guards and 600 Guard cavalry dismounted. Meanwhile on the extreme French right Schwarzenberg and his Austrians had drifted away towards their own frontier, and the Prussian contingent, which under Yorck formed part of Macdonald's command about Riga, had entered into a convention with the Russians at Tauroggen (Dec. 30) which deprived the French of the last support upon their left. Königsberg thus became untenable, and Murat fell back to Posen, where on Jan. 10 he handed over his command to Eugène Beauharnais and returned to Paris. The Russian pursuit practically ceased at the line of the Niemen, for the Russian troops also had suffered terrible hardships and a period of rest had become an absolute necessity.

The War of Liberation.—The Convention of Tauroggen became the starting-point of Prussia's regeneration. As the news of the destruction of the *Grande Armée* spread, and the appearance of countless stragglers convinced the Prussian people of the reality of the disaster, the spirit generated by years of French domination burst out. For the moment the king and his ministers were placed in a position of the greatest anxiety, for they knew the resources of France and the boundless versatility of their arch-enemy far too well to imagine that the end of their sufferings was yet in sight. To disavow the acts and desires of the army and of the secret societies for defence with which all north Germany was honeycombed would be to imperil the very existence of the monarchy, whilst an attack on the wreck of the *Grande Armée* meant the certainty of a terrible retribution from the new armies now rapidly forming on the Rhine.

But the Russians and the soldiers were resolved to continue the campaign, and working in collusion they put pressure on the not unwilling representatives of the civil power to facilitate the supply

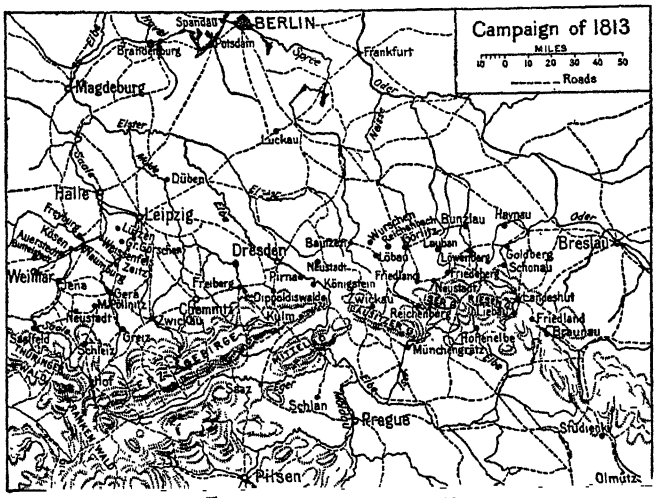

FIG. 8.—CAMPAIGN OF 1813

and equipment of such troops as were still in the field; they could not refuse food and shelter to their starving countrymen or their loyal allies, and thus by degrees the French garrisons scattered about the country either found themselves surrounded or were compelled to retire to avoid that fate. Thus it happened that the viceroy of Italy felt himself compelled to depart from the positive injunctions of the emperor to hold on at all costs to his advanced position at Posen, where about 14,000 men had gradually rallied around him, and to withdraw step by step to Magdeburg, where he met reinforcements and commanded the whole course of the lower Elbe.

Napoleon's Preparations.—Meanwhile the emperor in Paris had been organizing a fresh army for the reconquest of Prussia. Thanks to his having compelled his allies to fight his battles for him, he had not as yet drawn very heavily on the fighting resources of France, the actual percentage of men taken by the conscriptions during the years since 1806 being actually lower than that in force in continental armies of the early twentieth century. He had also created in 1811–12 a new National Guard, organized in "cohorts" to distinguish it from the regular army, and for home defence *only,* and these by a skilful appeal to their patriotism and judicious pressure applied through the prefects, became a useful reservoir of half-trained men for new battalions of the active army. Levies were also made with rigorous severity in the states of the Rhine Confederation, and even Italy was called on for fresh sacrifices. In this manner by the end of March upwards of 200,000 men were moving towards the Elbe,[1] and in the first fortnight of April they were duly concentrated in the angle formed by the Elbe and Saale, threatening on the one hand Berlin, on the other Dresden and the east.

The allies, aware of the gradual strengthening of their enemy's forces but themselves as yet unable to put more than 200,000 in the field, had left a small corps of observation opposite Madgeburg and along the Elbe to give timely notice of an advance towards Berlin; and with the bulk of their forces had taken up a position about Dresden, whence they had determined to march down the course of the Elbe and roll up the French from right to left. Both armies were very indifferently supplied with information, as both were without any reliable regular cavalry capable of piercing the screen of outposts with which each endeavoured to conceal his disposition, and Napoleon, operating in a most unfriendly country, suffered more in this respect than his adversaries.

[1]Napoleon always gave their number as 300,000, but this was never attained.

On April 25 Napoleon reached Erfurt and assumed the chief command. On this day his troops stood in the following positions: Eugène, with Lauriston's, Macdonald's and Regnier's corps, on the lower Saale; Ney in front of Weimar, holding the defile of Kösen; the Guard at Erfurt, Marmont at Gotha, Bertrand at Saalfeld, and Oudinot at Coburg, and during the next few days the whole were set in motion towards Merseburg and Leipzig, in the now stereotyped Napoleonic order, a strong advanced guard of all arms leading, the remainder—about two-thirds of the whole—following as *masse de manoeuvre,* this time, owing to the cover afforded by the Elbe on the left, to the right rear of the advanced guard.

Meanwhile the Russians and Prussians had concentrated all available men and were moving on an almost parallel line, but somewhat to the south of the direction taken by the French. On May 1 Napoleon and the advance guard entered Lützen. Wittgenstein, who now commanded the allies in place of Kutusov, hearing of his approach, had decided to attack the French advanced guard, which he took to be their whole force, on its right flank, and during the morning had drawn together the bulk of his forces on his right in the vicinity of Gross-Görschen and Kaya.

Battle of Lützen.—About 9 A.M. on May 2 he began an attack on the French advance guard in Lützen, whilst the remainder of his army was directed against Napoleon's right and rear. Just as the latter were moving off the heads of the French main body suddenly appeared, and at 11 A.M. Napoleon, then standing near the Gustavus Adolphus monument on the field of Lützen, heard the roar of a heavy cannonade to his right rear. He realized the situation in a moment, galloped to the new scene of action, and at once grouped his forces for decisive action—the gift in which he was supreme. Leaving the leading troops to repulse as best they might the furious attack of both Russians and Prussians, and caring little whether they lost ground, he rapidly organized for his own control a battle-reserve. At length when both sides were exhausted by their efforts he sent forward nearly a hundred guns which tore asunder by their case-shot fire the enemy's line and marched his reserve right through the gap. Had he possessed an adequate cavalry force the victory would have been decisive. As it was, the allies made good their retreat and the French were too exhausted for infantry pursuit.

Perhaps no battle better exemplifies the inherent strength of the emperor's strategy, and in none was his grasp of the battlefield more brilliantly displayed, for, as he fully recognized, "These Prussians have at last learnt something—they are no longer the wooden toys of Frederick the Great," and, on the other hand, the relative inferiority of his own men as compared with his veterans of Austerlitz called for far more individual effort than on any previous day. He was everywhere, encouraging and compelling his men—it is a legend in the French army that the persuasion even of the imperial boot was used upon some of his reluctant conscripts, and in the result his system was fully justified, as it triumphed even against a great tactical surprise.

Bautzen.—As soon as possible the army pressed on in pursuit, Ney being sent across the Elbe to turn the position of the allies at Dresden. This threat forced the latter to evacuate the town and retire over the Elbe, before blowing up the stone bridge across the river. Napoleon entered the town hard on their heels, but the broken bridge caused a delay of four days, there being no pontoon trains with the army. Ultimately on May 18 the march was renewed, but the allies had continued their retreat in leisurely fashion, picking up reinforcements by the way. Arrived at the line of the Spree, they took up and fortified a very formidable position about Bautzen (*q.v.*). Here, on the 20th, they were attacked and fixed by Napoleon; but the intended decisive coup by which Ney was to arrive on their right rear on the 21st missed its mark owing to Ney's want of initiative and rigid adherence to the letter of his orders. As a result the allies were able to break off the action at their own time and retire in such good order that the emperor failed to capture a single trophy as proof of his victory. The enemy's escape annoyed him greatly, the absence of captured guns and prisoners reminded him too much of his Russian experiences, and he redoubled his demands on his corps commanders for greater vigour in the pursuit. This led the latter to push on without due regard to tactical precautions, and Blücher took advantage of their carelessness when at Haynau (May 26), with some twenty squadrons of Landwehr cavalry, he surprised, rode over and almost destroyed Maison's division. The material loss inflicted on the French was not very great, but its effect in raising the *moral* of the raw Prussian cavalry and increasing their confidence in their old commander was enormous.

Still the allies continued their retreat and the French were unable to bring them to action. In view of the doubtful attitude of Austria, Napoleon became alarmed at the gradual lengthening of his lines of communication and opened negotiations. The enemy, having everything to gain and nothing to lose thereby, agreed finally to a six weeks' suspension of arms. This was perhaps the gravest military error of Napoleon's whole career, and his excuse for it, "want of adequate cavalry," was the strongest testimony as to the value of that arm.

As soon as a suspension of arms (to Aug. 15) had been agreed to, Napoleon hastened to withdraw his troops from the dangerous position they occupied with reference to the passes leading over the mountains from Bohemia, for he entertained no doubt now that Austria was also to be considered as an enemy. Finally he decided to group his corps round Görlitz and Bautzen whence they could either meet the enemy advancing from Breslau or fall on his flank over the mountains if he attempted to force his way into Saxony by the valley of the Elbe. This latter manoeuvre depended, however, on his maintenance of Dresden, and to this end he sent the I. Corps up the Elbe to Pirna and Königstein to cover the fortifications of Dresden itself. His instructions on this point deserve the closest study, for he foresaw the inevitable attraction which a complete entrenched camp would exercise even upon himself, and, therefore, limited his engineers to the construction of a strong bridge head on the right bank and a continuous enceinte, broken only by gaps for counter attack, around the town itself.

Then he turned his attention to the plan for the coming campaign. Seeing clearly that his want of an efficient cavalry precluded all ideas of a resolute offensive in his old style, he determined to limit himself to a defence of the line of the Elbe, a position of waiting from which he could make a spring, of not more than a few days' duration, at any target the enemy might present.

Reinforcements had been coming up without ceasing and at the beginning of August he calculated that he would have 300,000 men available about Bautzen and 100,000 along the Elbe from Hamburg via Magdeburg to Torgau. With the latter he determined to strike the first blow, by a concentric advance on Berlin (which he calculated he would reach on the 4th or 5th day), the movement being continued thence to extricate the French garrisons in Küstrin, Stettin and Danzig. The moral effect, he promised himself, would be prodigious, and there was neither room nor food for these 100,000 elsewhere. Towards the close of the armistice he learned the general situation of the allies. The crown prince of Sweden (Bernadotte), with his Swedes and various Prussian levies, 135,000 in all, lay in and around Berlin and Stettin; and knowing his former marshal well, Napoleon considered Oudinot a match for him. Blücher with about 95,000 Russians and Prussians was about Breslau, and Schwarzenberg, with nearly 180,000 Austrians and Russians, lay in Bohemia. In his central position at Bautzen he felt himself equal to all his enemy's combinations.

Dresden.—The advance towards Berlin began punctually with the expiration of the armistice, but with the main army he himself waited to see more clearly his adversaries' plans. At length becoming impatient he advanced a portion of his army towards Blücher, who fell back to draw him into a trap. Then the news reached him that Schwarzenberg was pressing down the valley of the Elbe, and, leaving Macdonald to observe Blücher, he hurried back to Bautzen to dispose his troops to cross the Bohemian mountains in the general direction of Königstein, a blow which would have had decisive results. But the news from Dresden, where the construction of the defences was still incomplete, was so alarming that at the last moment he changed his mind, and

sending Vandamme alone over the mountains, he hurried with his whole army to the threatened point. This march remains one of the most extraordinary in history, for the bulk of his forces moved, mainly in mass and across country, 90m. in 72 hours, entering Dresden on the morning of the 27th, only a few hours before the attack of the allies commenced. For the events which followed *see* DRESDEN: *Battle of Dresden.*

Dresden was the last great victory of the First Empire. By noon on Aug. 27 the Austrians and Russians were completely beaten and in full retreat, the French pressing hard behind them, but meanwhile Napoleon himself again succumbed to one of his unaccountable attacks of apparent intellectual paralysis. He seemed unaware of the vital importance of the moment, crouched shivering over a bivouac fire, and finally rode back to Dresden, leaving no specific orders for the further pursuit. The allies, however, continued to retreat, but unfortunately Vandamme, with his single corps and unsupported, issued out of the mountains on their flank, threw himself across their line of retreat near Kulm, and was completely overwhelmed by sheer weight of numbers (29th). In spite of this misfortune, Napoleon could claim a brilliant success for himself, but almost at the same moment news reached him that Oudinot at Grossbeeren near Berlin, and Macdonald on the Katzbach opposed to Blücher, had both been severely defeated.

Napoleon's Movements.—During the next two days the emperor examined his situation and, after discussing on paper the respective hypotheses of a spring at Prague or at Berlin, summed up in favour of the second. But his consideration of this project was interrupted by news which indicated that the consequences of Macdonald's defeat had been far more serious to the *moral* of that command than he had imagined. He immediately rode over to establish order, and his manner and violence were so improper that Caulaincourt had the greatest difficulty in concealing the scandal. Blücher, however, hearing of his arrival, at once retreated and the emperor followed, thus uncovering the passes over the Bohemian mountains, a fact of which Schwarzenberg was quick to take advantage. Learning of his approach, Napoleon again withdrew to Bautzen. Then hearing that the Austrians had counter-marched and were again moving towards Dresden, he hastened back there, concentrated as many men as could conveniently be handled, and advanced beyond Pirna and Königstein to meet him. But the Austrians had no intention of attacking him, for time was now working on their side and, leaving his men to starve in the exhausted district, the emperor again returned to Dresden, where for the rest of the month he remained in an extraordinary state of vacillation. On Oct. 4 he again drew up a review of the situation, in which he apparently contemplated giving up his communications with France and wintering in and around Dresden, though at the same time he was aware of the distress amongst his men for want of food.

Campaign of Leipzig.—In the meanwhile Blücher, Schwarzenberg and Bernadotte were working round his flanks. Ney, who had joined Oudinot after Grossbeeren, had been defeated at Dennewitz (Sept. 6), the victory, won by Prussian troops solely, giving the greatest encouragement to the enemy. Suddenly Napoleon's plans are again reviewed and completely changed. Calling up St. Cyr, whom he had already warned to remain at Dresden with his command, he decided to fall back towards Erfurt, and go into winter quarters between that place and Magdeburg, pointing out that Dresden was of no use to him as a base and that if he had a battle, he had much better have St. Cyr and his men with him than at Dresden. He then on Oct. 7 drew up a final plan, and this he immediately proceeded to put into execution, for he was now aware of the danger threatening his line of retreat from both Blücher and Schwarzenberg and the North Army; yet only a few hours afterwards the portion of the order relating to St. Cyr and Lobau was cancelled and the two were finally left behind at Dresden. From the 10th to the 13th Napoleon lay at Düben, again a prey to the most extraordinary irresolution, but on that day he thought he saw his opportunity. Blücher was reported near Wittenberg, and Schwarzenberg was moving slowly round to the south of Leipzig. The North Army under Bernadotte, unknown to Napoleon, lay on Blücher's left around Halle. The emperor decided to throw the bulk of his force on Blücher, and, having routed him, turn south on Schwarzenberg and sever his communications with Bohemia. His concentration was effected with his usual sureness and celerity, but whilst the French moved on Wittenberg, Blücher was marching to his right, indifferent to his communications as all Prussia lay behind him. This move on the 14th brought him into touch with Bernadotte, and now a single march forward of all three armies would have absolutely isolated Napoleon from France; but Bernadotte's nerve failed him, for on hearing of Napoleon's threat against Wittenberg he decided to retreat northward, and not all the persuasions of Blücher and Gneisenau could move him. Thus if the French movement momentarily ended in a blow in the air, it was indirectly the cause of their ultimate salvation.

The "Battle of the Nations."—On the 15th Napoleon concentrated his forces to the east of Leipzig, with only a weak detachment to the west, and in the evening the allies were prepared to attack him. Schwarzenberg had 180,000 men available at once and 60,000 on the following day; Blücher had about 60,000, but Bernadotte now could not arrive before the 18th.

Napoleon prepared to throw the bulk of his force upon Schwarzenberg and massed his troops south-east of the town, whilst Schwarzenberg marched concentrically against him down the valleys of the Elster and Pleisse, the mass of his troops on the right bank of the latter and a strong column under Giulay on the left working round to join Blücher on the north. The fighting which followed was most obstinate, but the Austrians failed to make any impression on the French positions, and indeed Giulay felt himself compelled to withdraw to his former position. On the other hand, Blücher carried the village of Möckern and came within a mile of the gates of the town. During the 17th there was only indecisive skirmishing, Schwarzenberg waiting for his reinforcements coming up by the Dresden road, Blücher for Bernadotte to come in on his left, and by some extraordinary oversight Giulay was brought closer in to the Austrian centre, thus opening for the French their line of retreat towards Erfurt, and no information of this movement appears to have been conveyed to Blücher. The emperor when he became aware of the movement, sent the IV. corps to Lindenau to keep the road open. On the 18th the fighting was resumed and by about noon Bernadotte came up and closed the gap to the N.E. of the town between Blücher and the Austrians. At 2 P.M. the Saxons, who had remained faithful to Napoleon longer than his other German allies, went over to the enemy. All hope of saving the battle had now to be given up, but the French covered their retreat obstinately and by daybreak next morning one-half of the army was already filing out along the road to Erfurt which had so fortunately been left for them.

It took Blücher time to extricate his troops from the confusion into which the battle had thrown them, and the garrison of Leipzig and the troops left on the right bank of the Elster still resisted obstinately—hence no direct pursuit could be initiated, and the French, still upwards of 100,000 strong, marching rapidly, soon gained distance enough to be reformed. Blücher followed by parallel and inferior roads on their northern flank, but Schwarzenberg knowing that the Bavarians also had forsaken the emperor and were marching under Wrede, 50,000 strong, to intercept his retreat, followed in a most leisurely fashion. Blücher did not succeed in overtaking the French, but the latter, near Hanau, found their way barred by Wrede with 50,000 men and over 100 guns in a strong position. To this fresh emergency Napoleon and his army responded in most brilliant fashion. As at Krasnoi in 1812, they went straight for their enemy and after one of the most brilliant series of artillery movements in history, directed by General Drouot, they marched right over their enemy, practically destroying his whole force. Henceforward their march was unmolested, and they reached Mainz on Nov. 5.

THE CAMPAIGN IN FRANCE IN 1814

When the last of the French troops had crossed to the western bank of the Rhine, divided counsels made their appearance at the headquarters of the allies. Everyone was weary of the war, and

many felt that it would be unwise to push Napoleon and the French nation to extremes. Hence a prolonged halt arose, utilized by the troops in renewing their equipment and so forth, but ultimately the Young German party, led by Blücher and the principal fighting men of the army, triumphed, and on Jan. 1, 1814, the Silesian army (50,000) began its passage of the Rhine at Kaub. They were to be supported by Schwarzenberg with 200,000 men,

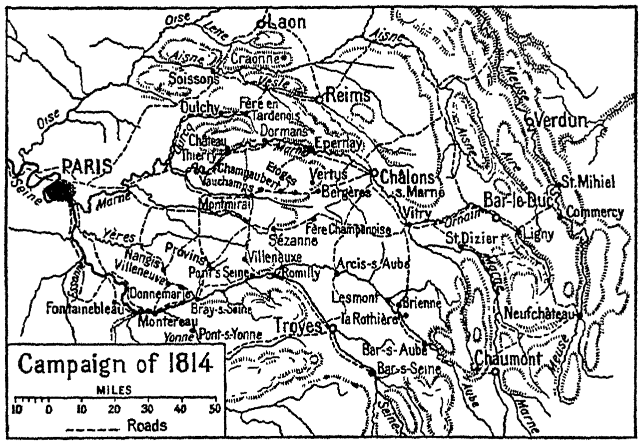

FIG. 9.—CAMPAIGN OF 1814

who was to advance by Basel and Neu Breisach to the south, and Bernadotte with the Northern army, about 120,000, was to move in support on the right flank through the Netherlands and Laon; this force was not yet ready and did not, in fact, reach the latter place till March. To meet these forces the emperor could not collect 200,000 men in all, of whom upwards of 100,000 were held by Wellington on the Spanish frontier, and 20,000 more were required to watch the debouches from the Alps. Hence less than 80,000 remained available for the east and north-eastern frontier. If, however, he was weak in numbers, he was now again operating in a friendly country, able to find food almost everywhere and practically indifferent as to his communications.

On Jan. 25 Blücher entered Nancy, and, moving rapidly up the valley of the Moselle, was in communication with the Austrian advanced guard near La Rothière on the afternoon of the 28th. Here his headquarters were surprised and he himself nearly captured by a sudden rush of French troops, and he learnt at the same time that the emperor in person was at hand. He accordingly fell back a few miles next morning to a strong position covering the exits from the Bar-sur-Aube defile. There he was joined by the Austrian advance guard, and together they decided to accept battle—indeed they had no alternative, as the roads in rear were so choked with traffic that retreat was out of the question. About noon Feb. 2 Napoleon attacked them, but the weather was terrible, and the ground so heavy that his favourite artillery, the mainstay of his whole system of warfare, was useless and in the drifts of snow which at intervals swept across the field, the columns lost their direction and many were severely handled by the Cossacks. At nightfall the fighting ceased and the emperor retired to Lesmont, and thence to Troyes, Marmont being left to observe the enemy.

Montmirail.—Owing to the state of the roads, more perhaps to the extraordinary lethargy which always characterized Schwarzenberg's headquarters, no pursuit was attempted. But on Feb. 4 Blücher, chafing at this inaction, obtained the permission of his own sovereign to transfer his line of operations to the valley of the Marne; Pahlen's corps of Cossacks were assigned to him to cover his left and maintain communication with the Austrians. Believing himself secure behind this screen, he advanced from Vitry along the roads leading down the valley of the Marne, with his columns widely separated for convenience of subsistence and shelter—the latter being almost essential in the terrible weather prevailing. Blücher himself on the night of the 7th was at Sézanne, on the exposed flank so as to be nearer to his sources of intelligence, and the rest of his army were distributed in four small corps at or near Épernay, Montmirail and Étoges; reinforcements also were on their way to join him and were then about Vitry.

In the night his headquarters were again surprised, and he learnt that Napoleon himself with his main body was in full march to fall on his scattered detachments. At the same time he heard that Pahlen's Cossacks had been withdrawn forty-eight hours previously, thus completely exposing his flank. He himself retreated towards Étoges endeavouring to rally his scattered detachments, but Napoleon was too quick for him and in three successive days he defeated Sacken at Montmirail, Yorck at Champaubert and Blücher and his main body at Étoges, pursuing the latter towards Vertus. These disasters compelled the retreat of the whole Silesian army, and Napoleon, leaving Mortier and Marmont to deal with them, hurried back to Troyes with his main body to strike the flank of Schwarzenberg's army, which had meanwhile begun its leisurely advance, and again at Mormant on Feb. 17, Montereau the 18th and Méry the 21st, he inflicted such heavy punishment upon his adversaries that they fell back precipitately to Bar-sur-Aube.

In the meantime Blücher had rallied his scattered forces and was driving Marmont and Mortier before him. Napoleon, as soon as he had disembarrassed himself of Schwarzenberg, countermarched his main body and moving again by Sézanne, fell upon Blücher's left and drove him back upon Soissons. This place had been held by a French garrison, but had capitulated only twenty-four hours beforehand, a fact of which Napoleon was naturally unaware. The Silesian army was thus able to escape, and marching northwards combined with Bernadotte at Laon—this reinforcement bringing the forces at Blücher's disposal up to over 100,000 men. On March 7 Napoleon fell upon the advance guard of this force at Craonne and drove it back upon Laon, where a battle took place on the 9th. Napoleon was here defeated, and with only 30,000 men at his back he was compelled to renounce all ideas of a further offensive, and he retired to rest his troops at Reims. Here he remained unmolested for a few days, for Blücher was struck down by sickness, and in his absence nothing was done. On March 14, however, Schwarzenberg, becoming aware of Napoleon's withdrawal to Reims, again began his advance and had reached Arcis-sur-Aube when the news of Napoleon's approach again induced him to retreat to Brienne.

The Allies March on Paris.—Thus after six weeks' fighting the allies were hardly more advanced than at the beginning. Now, however, they began to realize the weakness of their opponent, and, still more, the weakening of his political stability. Napoleon, coincidently, aware of the limitations of a strategy of continual parrying, was seized with the idea of a decisive coup against Schwarzenberg's communications. He determined to move eastward to St. Dizier, rally what garrisons he could find, and raise the whole country against the invaders, and had actually started on the execution of this plan when his instructions fell into the enemy's hands and his projects were exposed. The Czar Alexander called a council of war at which General Toll in opposition to his seniors, urged that instead of following Napoleon the allies should disregard the threat to their rear and advance by forced marches on Paris, whose people were reported to be "tired of the war and of Napoleon." His arguments for this moral objective won over the Czar and at his instigation the allies marched straight for the capital. Marmont and Mortier with what troops they could rally took up a position on Montmartre heights to oppose them, but seeing further resistance to be hopeless they gave way on March 31, just as Napoleon, with the wreck of the Guards and a mere handful of other detachments, was hurrying across the rear of the Austrians towards Fontainebleau to join them.

This was the end of the First Empire. The story of the WATERLOO CAMPAIGN, 1815, is told under its own heading.

BIBLIOGRAPHY.—Among the principal modern works on Napoleon's campaigns 1805–14 are the following: Yorck von Wartenberg, *Napoleon als Feldherr* (1866, English and French translations); H. Camon, *La Guerre napoléonienne* (Paris, 1903); H. Bonnal, *Esprit de la guerre moderne* (a series of works, of which those dealing with 1805–1812 are separately mentioned below.) For 1805 *see* Alombert and Colin (French Gen. Staff), *Campagne de 1805 en Allemagne* (Paris, 1898–1910); H. Bonnal, *De Rosbach à Ulm* (Paris, 1903); G. A. Furse, *Ulm, Trafalgar and Austerlitz* (London, 1905). For 1806–1807, Pr. Kraft zu Hohenlohe-Ingelfingen, *Letters on Strategy* (Eng. trans., vol.

i.); Freiherr v. d. Goltz, *Von Rossbach bis Jena und Auerstädt* (Berlin, 1906) and *Von Jena bis Preussisch-Eylau* (Berlin, 1908); H. Bonnal, *La Manoeuvre d'Iéna* (Paris, 1904); *Memoirs of Bennigsen* (trans. by E. Cazalas, French Gen. Staff, 1909); F. N. Maude, *The Jena Campaign* (London, 1909). For 1809, H. Bonnal, *La Manoeuvre de Landshut* (Paris, 1905); Saski, *Campagne de 1809* (Paris, 1899–1902); Ritter v. Angeli, *Erzherzog Karl* (Vienna, 1895–1897); Lieut. Field Marshal von Woinovich (ed.), *Das Kriegsjahr 1809*; Buat, *De Ratisbonne à Znadim* (Paris, 1910). For 1812, G. Fabry (French Gen. Staff), *Campagne de 1812* (Paris, 1904); *La Guerre nationale de 1812* (French translation from the Russian general staff work, Paris, 1904); H. Bonnal, *La Manoeuvre de Vilna* (Paris, 1905); Freiherr v. d. Osten-Sacken, *Feldzug 1812* (Berlin, 1899). For 1813, F. N. Maude, *The Leipzig Campaign* (London, 1908); Lanrezac, *La Manoeuvre de Lützen*; B. v. Quistorp, *Gesch. der Nordarmee 1813* (1894); v. Holleben, *Gesch. des Frühjahrsfeldzug 1813* (Berlin, 1904); Friedrich, *Der Herbstfeldzug 1813* (Berlin, 1903–1906). For 1814, German Gen. Staff, *Kriegsgesch. Einzelschriften*, No. 13; v. Janson, *Der Feldzug 1814 in Frankreich* (Berlin, 1903–1905). *See* also works mentioned under FRENCH REVOLUTIONARY WARS and under biographical headings, as well as the general histories of the time. (F. N. M.)

NAVAL OPERATIONS

The Peace of Amiens in 1802 was productive of but a brief truce. Napoleon's ambitions and actions were such as quickly to re-awaken European suspicions, and his refusal to evacuate the Netherlands was alone enough to arouse England and cause her to declare war on him as early as May 18, 1803. From then onwards, for over two years, the war took the form of a gigantic scheme, on the part of Napoleon, for an invasion of England—a scheme which led to the movements known as the Trafalgar Campaign which, in its turn, led to the Battle of Trafalgar. Boulogne was chosen as the base for the French operations; along the coast on either side an army of some 150,000 men was encamped, and specially-constructed flat-bottomed boats for their transport were brought from all parts of France. The army was given constant practice in embarkation and disembarkation, and, in the meantime, it proved impossible for the British ships to do much damage to this armament owing to the shallow water on the coastline. In order, however, to carry through his scheme successfully, Napoleon had got to obtain at least a temporary control of the Channel, and this meant either defeating the British fleet on equal terms in action, or, by some means, causing the various parts of it to scatter on some wild-goose chase, so giving himself the chance to bring every available ship to the Channel and overwhelm the British fleet there by sheer weight of numbers. French fleets were stationed at Brest, Rochefort, L'Orient and Toulon; all of them were watched by British blockading squadrons. From the end of 1804, when Spain entered the war on his side, Napoleon was able to add to this total Spanish squadrons at Corunna, Ferrol, Cadiz and Cartagena, all of which the British blockaded. The total number of ships at Napoleon's command was about 60, the English had an approximately equal number employed in blockading them. His plan, then, took the form of attempting to elude these blockading squadrons and make them scatter to various parts of the world in search of his escaped squadrons which would, after concentrating at a given rendez-vous, return to the Channel to crush Cornwallis and the English Channel Fleet, if indeed that had not scattered too, after the presumed escape of the Brest Fleet which it was blockading. In either case Napoleon might hope to achieve his object—control of the Channel for long enough to enable him to take his troops across, while the British squadrons returned from the various parts of the world to which he seemed to think they might sail. The scheme was an exceedingly weak one, and postulated a gross ignorance of naval strategy on the part of that country that had been its greatest exponent. The British Admiralty upset it by a single order. The various blockading squadrons, if they were eluded by the squadrons they were blockading, were to fall back on Cornwallis. Thus if all the French squadrons united at the appointed rendez-vous (which was Martinique) and sailed for the Channel, they would merely find Cornwallis with an equally concentrated fleet, and the extent of the British concentration would depend on, and be equal to, that of the French.

The first move occurred in January 1805 when the Rochefort squadron of five ships escaped and sailed for the West Indies, but it proved an isolated effort. On March 30, however, Admiral Villeneuve used a gale to elude Nelson who was watching him off Toulon, and got clear away with eleven ships which he increased to eighteen by picking up the Cadiz Squadron, reaching Martinique on May 14. He was joined on June 1, by two ships from Rochefort, but no others put in an appearance. He should have waited until nearly the end of the month before sailing back to Europe to try and pick up those squadrons which failed to join him, preliminary to making for Brest, whence Admiral Gantheaume was trying unsuccessfully to emerge from time to time. Only a week later, however, information reached Villeneuve that Nelson was already in the West Indies in search of him, and he decided to make for European waters immediately. Nelson, after having been evaded off Toulon should, according to his orders, have fallen back on Cornwallis, but he preferred, not for the first time, to follow his own course. It has often been said that Villeneuve induced Nelson to follow him and that, in doing so, the latter was playing into Napoleon's hands. The foolishness of this can be seen in the fact that the mere information that Nelson was in the neighbourhood caused Villeneuve to make for home a considerable time before he was due to depart, and any hope of a West Indian concentration was thus lost. When Napoleon hoped that the English blockading squadrons would scatter, he meant to places where the French had not gone. Foiled by false information of his hope of catching Villeneuve, Nelson sent a fast brig home to warn the Admiralty of the former's return, and himself sailed for Gibraltar. The Admiralty despatched Sir Robert Calder to intercept Villeneuve; this he did, off Finisterre, and, in a not very satisfactory action, fought in a fog, deprived him of two Spanish battleships, but let him make Ferrol. Here the French Admiral received reinforcements, and his next move, according to his programme, should have been to make for the Channel in an attempt to unite with the Brest fleet. But he conceived, rightly, that Napoleon's scheme had already been foiled and that his task would be impossible; thus when he left Ferrol he made, not for the Channel, but for Cadiz. Here he was blockaded by Nelson and Collingwood. The Trafalgar Campaign, as a campaign, was over, and the invasion scheme was a failure. Napoleon broke up his camp and marched his troops against Austria. A natural corollary of the Trafalgar Campaign was the battle of Trafalgar, but it must be realised that it was the former that saved England from invasion. In the autumn Napoleon needed a fleet in the Mediterranean and ordered Villeneuve to proceed there. The latter, after a protest, attempted to comply, and was beaten, as all the world knows, on Oct. 21, 1805 with a loss of twenty ships.

The victory of Trafalgar, while it did not end the war, conferred upon England the complete command of the sea. Thereafter naval activity was most pronounced, and the British Navy was employed in numerous undertakings in all parts of the world; but it becomes impossible to trace out any broad policy. It only remains to point out some of the more prominent incidents. Napoleon's operations with Russia produced some naval activity. England attempted to assist that country when in 1807 Napoleon was preparing a final blow against her, by forcing the Dardanelles —Turkey being then allied with France. Admiral Duckworth was selected for the operation, and he actually silenced the batteries in the Straits and appeared off Constantinople. There he was helpless for lack of bombships, and had to retire under a damaging fire. Later in the same year the third coalition against France came to a final end when Napoleon and the Tsar of Russia signed the Treaty of Tilsit, by which they agreed to cease war and both plot for England's overthrow. One scheme they hatched was to seize all the neutral fleets in Europe and employ them against their common enemy. The largest neutral navy was Denmark's, and Canning, having providentially heard of this peculiar arrangement, anticipated a Franco-Russian breach of Danish neutrality by sending Admiral Gambier to "borrow" this fleet for the duration of the war. Gambier bombarded Copenhagen and returned with 70 out of 72 of the Danes' fighting ships.

Napoleon's Berlin and Milan Decrees, by which he hoped to break England's merchant marine, and England's reply with the Orders in Council, also gave the British navy opportunities to

show its command of the sea. Napoleon forbade continental countries to import British goods either in British or foreign ships. England in turn seized neutral ships that called at a continental port without also calling at a British port. The struggle forced England to open new markets in the east and South America, but several countries rebelled against Napoleon's system and England was always ready to help. The revolt of Portugal began in 1808 and produced the Peninsular War, which ought to be thought of as partly a naval operation, for the fleet took off the army after Corunna, was always behind the duke of Wellington's lines at Torres Vedras and finally followed, as nearly as possible, his victorious advance.

The revolt of Austria in 1809 produced the combined expedition against Antwerp, commanded by Admiral Strachan and Lord Chatham, which hoped to find some sympathy among the Netherlanders for their Austrian former rulers. Walcheren and Flushing were captured, but the expedition had to retreat after the collapse of Austria. Finally, England's resistance to Napoleon's decrees involved it in 1812 in war with the United States, which considered itself ill-treated in the matter of the seizure of ships.

The British lost many single-ship actions with the Americans, their only success being that of the "Shannon" over the "Chesapeake," but the United States let its very natural jubilation rather blind it to the fact that its coasts were blockaded without serious challenge.

This is but a small selection from the numerous incidents that make up the naval side of the Napoleonic War after Trafalgar. The main point is that British sea supremacy was unchallenged after that battle, and the royal navy remained Napoleon's worst enemy to the end, for it was the British "Bellerophon" which intercepted him when, after Waterloo, he sought to escape to the United States to carve out an empire in a new world.

NAPOLEONITE, or Corsite, a gabbro showing orbicular structure from Santa Lucia di Tallano, Corsica.

The rock when cut and polished makes a beautiful ornamental stone, examples of which are to be found in most petrographical museums. Although often referred to as a diorite, corsite in its mineral and chemical composition corresponds to a hornblende gabbro. The orbicules, remarkable for their uniformity in structure, range from three-fourths inch to two inches in diameter and are set in a matrix of variable grain size built up of green hornblende, cummingtonite and bytownite feldspar (An_{75}).

The core of these structures consists of material mineralogically similar to the matrix but richer in feldspar; it is followed by a series of broad and narrow zones, respectively, of radiate plagioclase and green hornblende-cummingtonite intergrowths also radially arranged. Both the plagioclase of the core and of the broad zones is distinctly more calcic (An_{88}) than that of the matrix. These relations are in accord with the concept that the orbicules developed in a crystallizing liquid and the structure itself has probably arisen by rhythmic crystallization.

Orbicular or spheroidal structures, though by no means common, have been found in the crystalline rocks of Sweden, Finland, the U.S.S.R. and America. They have been particularly closely studied by the petrologists of Finland and are there known as esboites. The mutual relations in composition and structure of orbicule and matrix in some of these rocks, especially those of Finland, have led to the opinion that the structures are metamorphic in origin, the orbicules developing in a solid or quasi-solid matrix which has in part been converted into a migmatite by metasomatic replacement.

See P. Eskola, "On the Esboitic Crystallization of Orbicular Rocks," *J. Geol.*, vol. xlvi, pp. 448–485 (1938). (C. E. T.)

NAPRAPATHY is a system of manipulative drugless treatment founded in 1907 by Oakley Smith, based on a theory that connective tissue which has become shrunken as the result of injury is the basic cause of disease. A shrunken strand of connective tissue is called a ligatight and may occur in the spine, thorax, pelvis or elsewhere. It is claimed that such tissue can be corrected by naprapathic treatment, which aims at stretching the shrunken strands.

Study of a set of charts showing types of ligatights and manipulations to correct them are held to be an important part of the practitioner's training.

NAPRAVNIK, EDWARD (1839–1915), Czech conductor and composer, was born at Beisht in Bohemia on Aug. 26, 1839. In 1861 he went to St. Petersburg (Leningrad) as conductor to Prince Youssipov. Through the influence of Liadov he obtained a post at the Marinsky theatre and in 1869 succeeded him as first conductor there. He died Nov. 10, 1915.

Napravnik wrote several operas, including *Francesca di Rimini*, op. 71; four symphonies; and orchestral, choral and piano pieces.

NAQUET, ALFRED JOSEPH (1834–1916), French chemist and politician, was born at Carpentras (Vaucluse) on Oct. 6, 1834. In 1863 he was made professor of medicine in Paris, and of chemistry in Palermo. In 1867 he was imprisoned for 15 months and lost his professorships for his share in a secret society, and in 1869 took refuge in Spain on the prosecution of his book *Religion, propriété, famille.*

Naquet became secretary of the commission of national defense, sitting on the extreme left in the national assembly. By his efforts in the senate, where he sat from 1883, in 1886 divorce became legal after three years of definite separation, on the demand of one of the parties concerned. In 1890 he resigned from the senate and took his seat with the Boulangist deputies in the chamber of deputies.

Naquet wrote *Principes de chimie fondés sur les théories modernes* (1865); *Socialisme collectiviste et socialisme libéral; Loi du divorce* (1903).

NARA, an important water channel in Sind, India, probably representing a former bed of the Indus, though now traversing the desert far east of the river. A perennial stream 262 mi. long, with 631 mi. of canals, it irrigates an area of more than 250,000 ac.

NARA, a town of Japan, in the province of Yamato, 25½ mi. from Osaka by rail. Pop. (1950) 77,866. It lies on the slope of a range of picturesque hills, beautifully wooded with cryptomerias and evergreen oaks. Nara remained the metropolis during seven consecutive reigns (709 to 784), and its 75 years of favoured existence sufficed for the building and furnishing of several imposing shrines and temples, for the laying out of a noble park and for the casting of a colossal image of Buddha. In Nara and its environs there have been preserved important and beautiful remains of architecture dating back to the 7th and 8th centuries, such as parts of the Buddhist monasteries called Hōryūji, Yakushiji, Kōfukuji and Tōdaiji, together with remarkable examples of sculpture of similar age, notable among which are such celebrated Buddhist images as the Kudara Kwannon, the Chūgūji Kwannon, bronze Shaka trinity of A.D. 623 and many other distinguished works of art.

Many articles and ornaments used in the Nara palaces have been preserved for nearly 1,200 years in a storehouse, the Shōsō-in. They give a picture of the court life of those days and show evidence of cultural relations not only with China but with western Asia. The Shinto shrine of Kasuga, doubtless many times rebuilt, still preserves in its shape and decoration features of the primitive style of Japanese architecture. Nara has a fine park, and efforts are made to preserve the ancient characteristics of the town.

NARBADA (Nerbudda), a river of India. It is regarded as the boundary between Hindustan proper and the Deccan. It rises on the summit of Amarkantak hill in Rewa state, and for the first 200 mi. of its course winds among the Mandla hills, which

form the head of the Satpura range; then at Jubbulpore, passing through the "Marble Rocks," it enters its proper valley between the Vindhyan and Satpura ranges, and pursues a direct westerly course to the Gulf of Cambay. Its total course through the Central Provinces and Gujarat amounts to about 800 m., and it falls into the sea in the Bombay district of Broach. It receives the drainage of the northern slopes of the Satpuras, but not that of the Vindhyan tableland, the streams from which flow into the Ganges and Jumna. After leaving the Central Provinces, the river widens out in the fertile district of Broach, with an average breadth of ½ m. to 1 m. Below Broach city it forms an estuary which is 13 m. broad where it enters the Gulf of Cambay. The Narbada is nowhere utilized for irrigation, and navigation is confined to the lower section. In the rainy season boats of considerable size sail about 60 m. above Broach city. In sanctity the Narbada ranks only second to the Ganges among the rivers of India, and along its whole course are special places of pilgrimage. The most meritorious act that a pilgrim can perform is to walk from the sea to the source of the river and back along the opposite bank.

The Narbada has given its name to a division of the Central Provinces, comprising the five districts of Narsinghpur, Hoshangabad, Nimar, Betul and Chindwara. Area, 18,534 sq.mi.; pop. (1921) 2,013,021.

NARBONNE, a city of France, capital of an arrondissement in the department of Aude, in a vine-growing plain 5 mi. from the Mediterranean, 37 mi. E. of Carcassonne. Pop. (1946) 29,975. Narbonne was the capital of the Volcae Tectosages. There the Romans in 118 B.C. founded their first colony in Gaul, named *Narbo Martius;* they built great works to protect the city from inundation and to improve its port, situated on a lake now filled up. The capital of Gallia Narbonensis, the seat of a proconsul and a station for the Roman fleet, Narbo Martius became the rival of Massilia. But the division of Gallia Narbonensis into two provinces lessened its importance. Alans, Suevi, Vandals, each held the city, and at last, in 413, it was occupied by the Visigoths, whose capital it afterwards became. In 719, after a siege of two years, it was captured and extended by the Saracens. Charles Martel, after the battle of Poitiers, and Pippin the Short, in 752, were both repulsed from its walls; but on a new attempt, after an investment of seven years, the Franks again forced their way into Narbonne. Charlemagne made the city the capital of the duchy of Gothia, and divided it into three lordships—one for the bishop, another for a Frankish lord and the third for the Jews. In the 13th century the archbishopric was seized by the pope's legate, Arnaud Amaury, who took the title of viscount of Narbonne. Simon de Montfort, however, deprived him of this dignity, receiving from Philip Augustus the duchy of Narbonne along with the county of Toulouse. By his expulsion of the Jews Philip the Fair hastened the decay of the city; and about the same period the Aude, which had formerly been diverted by the Romans, ceased to flow towards Narbonne and the harbour was silted up. United to the French crown in 1507, Narbonne was enclosed by a new line of walls under Francis I but had the last portions of its ramparts demolished in 1870. The archbishopric was founded about the middle of the 3rd century, its first holder being Sergius Paulus; it was suppressed in 1790. The Robine canal, a branch of the Canal du Midi, divides Narbonne into the *bourg* and the *cité.* The former 13th century cathedral (St. Just), consists only of a choir 130 ft. high and transept. The towers (194 ft. high) at each end of the transept date from 1480. The apse of the cathedral was formerly joined to the fortifications of the archiepiscopal palace, and the two buildings are still connected by a mutilated cloister of the 14th and 15th centuries. Part of the palace now serves as *hôtel de ville,* and the palace garden contains many fragments of Roman work; the Musée Lapidaire in the Lamourguier buildings has similar Roman remains. The church of St. Paul, though partly Romanesque, is for the south of France a rare example of a building of the early 13th century in the Gothic style of the north. It possesses some ancient Christian sarcophagi and fine Renaissance wood carving. Narbonne has a subprefecture, tribunals of first instance and of commerce, a board of trade arbitrators and a chamber of commerce. It has a good trade in wine and spirituous liquors, salt, tartar, almonds and leather. The industries include cooperage, sulphur-refining, brandy-distilling and the manufacture of bricks and tiles.

NARBOROUGH, SIR JOHN (d. 1688), English naval commander, was descended from an old Norfolk family. He received his commission in 1664, and in 1666 was promoted lieutenant for gallantry in the action with the Dutch fleet off the Downs in June of that year. After the peace he was chosen to conduct a voyage of exploration in the South Seas. He set sail from Deptford on Nov. 26, 1669, and entered the Straits of Magellan in October 1670 but returned home in June 1671 without accomplishing his original purpose. A narrative of the expedition was published in 1694 under the title *An Account of several late Voyages and Discoveries to the South and North.* During the second Dutch War Narborough was second captain of the lord high-admiral's ship the "Prince," and distinguished himself at Southwold Bay in May 1672. In 1675 he was sent to suppress the Tripoline piracies, and by the bold expedient of despatching gun-boats into the harbour of Tripoli at midnight and burning the ships he induced the bey to agree to a treaty. Shortly after his return he undertook a similar expedition against the Algerines. In 1680 he was appointed commissioner of the navy, an office he held till his death in 1688.

See J. Charnock, *Biographia Navalis,* vol. i. (6 vols., 1794–98).

NARCEINE, $C_{23}H_{27}NO_8+3H_2O$, an alkaloid of opium discovered by P. J. Pelletier (1832). It forms silky needles melting at 170° C., and is genetically related to narcotine (*q.v.*), from which it may be prepared by the action of alkali on the methochloride derivative. It has no uses in medicine, but is of considerable theoretical importance for the structure of narcotine. (L. F. Sl.)

NARCISSUS, in Greek mythology, son of the river god Cephissus and the nymph Leiriope, distinguished for his beauty. The seer Teiresias told his mother that he would have a long life, provided he never looked upon his own features. His rejection of the love of the nymph Echo (*q.v.*), or of his lover Ameinias drew upon him the vengeance of the gods. Having fallen in love with his own reflection in the waters of a spring, he pined away (or killed himself) and the flower that bears his name sprang up where he died. According to Pausanias, Narcissus, to console himself for the death of a favourite twin sister, his exact counterpart, sat gazing into the spring to recall her features by his own.

It is a very plausible suggestion of Frazer (*Golden Bough,* iii. p. 94) that this story is to be connected with the widespread belief that it is unlucky, or even fatal, to see one's own reflection. This superstition existed in Greece, *see* Iamblichus, *Protrept.,* 21; Boehm, *de Symbolis Pythagoreis,* p. 51 (1905); Artemidorus, *Oneirocr.* ii., 7 (p. 91, 1, Hercher).

Hence is derived the term *narcissism,* used by psychologists, especially Freudians, for a morbid condition in which the subject is intensely interested in his own body.

Bibliography.— *See* Ovid, *Metam.* iii. 341–510; Pausanias ix. 31, 7; Conon, *Narrationes,* 24; F. Wieseler, *Narkissos* (1856); Greve in Roscher's *Lexikon der Mythologie.*

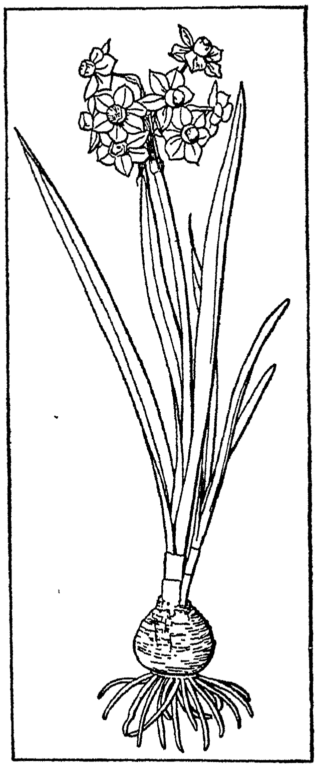
NARCISSUS (d. A.D. 54) was a freedman of Claudius, and his secretary *ab epistulis.* Narcissus and Messallina between them exercised an unbounded influence over the emperor, and arranged the execution or exile of their opponents almost at pleasure. Narcissus was sent to Britain to subdue the mutiny of the soldiers of A. Plautius. He was not well received, but the mutiny subsided. Narcissus was almost solely responsible for the ultimate downfall of Messallina in the Silius affair. It was he who made Claudius alarmed for his own safety, who succeeded in hardening him against Messallina's appeals, and who finally gave the order for her execution when Claudius hesitated. For this he received the insignia of praetor. Eventually he made a false move over Claudius' second marriage, for which he supported Aetia Petina, and further antagonized Agrippina by backing the claims of Britannicus to the throne. As a result he was put to death on Nero's accession in A.D. 54. Narcissus' importance is an early example of the power of the freedmen-secretaries of the emperor's household, and represented the first step towards the transforma-

tion of the emperor's personal staff into an imperial civil service.
See Sac. *Ann.* xi., xii., xiii., 1.; Dio Cass. ix.; Suet. *Claudius.*

NARCISSUS, a genus of bulbous plants belonging to the family Amaryllidaceae, natives of central Europe, and the Mediterranean region; one species *N. Tazetta,* extends through Asia to Japan. From some of these, by cultivation and hybridization, have arisen the very numerous modern varieties. The plants have long narrow leaves springing from the bulb and a central scape bearing one or more generally large, white or yellow, drooping or inclined flowers. The flowers are regular, with a perianth springing from above the ovary, tubular below, with spreading segments and a central corona; the six stamens are inserted within the tube. The most interesting feature botanically is the "corona" or "cup," which springs from the base of the flower-segments and this gives the special character to the flower. There are five well-marked sections:

(1) The hoop-petticoat narcissi are not more than from 4 to 12 in. in height and have grassy foliage and yellow or white flowers. These have the corona in the centre of the flower very large in proportion to the other parts, and much expanded, like the old hooped petticoats. They are all regarded as varieties or forms of the common hoop-petticoat, *N. Bulbocodium,* which has comparatively large bright yellow flowers.

(2) A second group is that of the pseudo-narcissi, of which the daffodil, *N. pseudo-narcissus,* is the type. The daffodil is common in woods and thickets in most parts of the north of Europe. Its leaves are about 1 ft. in length and 1 in. in breadth, and have a blunt keel and flat edges. The stem is about 18 in. long and the spathe single-flowered. The flowers are large, yellow, scented and a little drooping, with a corolla deeply cleft into six lobes and a bell-shaped corona which is crisped at the margin; they appear in March or April. In this species the corona is also very large and prominent.



BY COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM (NATURAL HISTORY)

NARCISSUS (NARCISSUS TAZETTA)

(3) Another group, with coronas of medium size, includes the fine and numerous varieties of *N. incomparabilis,* one of which, with large, double flowers, is known as butter-and-eggs; *N. odorus,* known as the campernelle jonquil, has two to four uniform bright yellow flowers and is considered a hybrid between *N. Jonquilla* and *N. pseudo-narcissus* although it is found wild in France and Spain.

(4) The polyanthus or bunch narcissi form another well-marked group, whose peculiarity of producing many flowers on the stem is indicated by the name. In these the corona is small and shallow as compared with the perianth. *N. Tazetta* is the type of this group. They are general favourites among spring flowers. The "Chinese sacred lily" or joss flower is a variety of *N. Tazetta.* The jonquil, *N. Jonquilla,* with yellow flowers, a native of south Europe and Algeria, is also grown in pots for early flowering, but does well outside in a warm border.

(5) There remains another little group, the poet's or pheasant's-eye narcissi (*N. poeticus*), in which the perianth is large, spreading and conspicuous and the corona very small and shallow. These pheasant's-eye narcissi, of which there are several well-marked varieties, blossom in succession during April and May and all do well in the open borders as permanent hardy bulbs. They are often grown in rock gardens.

See F. W. Burbridge, *The Narcissus* (1875); a scientific treatment of the genus will be found in J. G. Baker's *Handbook of Amaryllideae* (1888); *see* also J. Weathers, *Practical Guide to Garden Plants* (1901); Sanders, *Encyclopaedia of Gardening* (1912); L. H. Bailey, *The Standard Cyclopedia of Horticulture* (1933) and the group system adopted by the Royal Horticultural society (1929).

NARCOTICS, a general term for substances which produce lethargy or stupor and the relief of pain. In a restricted sense, the term applies to opium (*q.v.*) or coca leaves or any compound, manufacture, salt or preparation thereof, even though their action is not narcotic. Prescriptions for these substances in most countries require that the prescribing physician be registered with the proper governmental agency (department of internal revenue in the U.S.) and comply with the regulations furnished by that agency. (*See* DRUG ADDICTION; MEDICAL LEGISLATION.)

(F. L. A.)

NARCOTINE, $C_{22}H_{23}NO_7$, an alkaloid (*q.v.*) found in opium, in amounts varying from 1% to 10%. It was first isolated pure by Pierre Robiquet in 1817 but was not synthesized until 1911 (W. H. Perkin, Jr., and Robert Robinson). It belongs to the benzylisoquinoline group of alkaloids and differs from hydrastine (*q.v.*) only in containing an additional methoxyl (OCH_3) group. Narcotine crystallizes from alcohol in colourless prisms melting at 176° C.; it is slightly soluble in hot water, sparingly in alcohol or benzene and soluble in chloroform. The specific rotation is −198° (in chloroform), but solutions in acids are dextrorotatory. Narcotine is a weak base, without effect on litmus, and as such its salts with acids are largely broken down into the components by water. It dissolves in hot alkali, but is thereby changed chemically (hydrolysis of a lactone ring). Narcotine is relatively inert physiologically, and is used chiefly in the manufacture of cotarnine. The latter is formed, together with opianic acid $C_{10}H_{10}O_5$, through an oxidative hydrolysis, by the action of nitric acid, manganese dioxide or other oxidizing agents. Cotarnine, $C_{12}H_{15}NO_4$, discovered by Friedrich Wöhler (1844), forms colourless needles that melt at 132° C. The salts with acids are formed with loss of a molecule of water and are yellow. Cotarnine chloride (stypticin), $C_{12}H_{14}NO_3Cl+2H_2O$, and the phthalate (styptol) are used as haemostatic agents to check uterine bleeding.

(L. F. SL.)

NARDI, JACOPO (b. 1476), Florentine historian, occupied various positions in the service of the Florentine republic after the expulsion of the Medici in 1494, and even on their return in 1512 he continued in the public service.

In 1527 he joined in the movement for the expulsion of the family and was instrumental in defeating the Medicean troops under Cardinal Passerini, who were attacking the Palazzo della Signoria. When the Medici again definitely became masters of Florence in 1530, Nardi was exiled from the city and his property confiscated. He spent the rest of his days in various parts of Italy, chiefly in Venice, and wrote a statement of the claims of the Florentine exiles against the Medici, addressed to the emperor Charles V. His chief work was *Istorie della Città di Firenze,* covering the period from 1498 to 1538, in part based on Biagio Buonaccorsi's *Diario.*

L. Arbib's edition of Nardi's history (Florence, 1842) and Agenore Gelli's edition (Florence, 1888) contain a biography of the author.

NARDINI, PIETRO (1722–1793), Italian violinist and composer, was born at Fibiana in Tuscany in 1722. He studied violin and composition at Leghorn and later became a pupil of Giuseppe Tartini at Padua.

For 15 years he held an appointment at the court of Stuttgart as solo violinist. In 1767 he settled at Leghorn and was with Tartini in his last illness. He became music director to the duke of Tuscany in 1770 and enjoyed great fame as a performer and composer. He died at Florence on May 7, 1793. Nardini is remembered as Tartini's most famous pupil, and as the composer of many graceful compositions for the violin. His music is melodious and eminently playable, and has an educational value in respect of technique. Modern reprints of the sonatas are found in Alard's *Maîtres classiques,* in David's *Hohe Schule des Violinspiels* and in Jensen's *Classische Violinmusik.*

NARES, SIR GEORGE STRONG (1831–1915), English arctic explorer, son of a captain in the navy, was educated at the Royal Naval college at New Cross and entered the navy in 1846. He served on the Australian station, was mate of the "Resolute" in the arctic expedition of 1852 and then served in the Crimea. He was then employed in surveying work on the northeast coast of Australia and in the Mediterranean. While in command of the "Challenger" (1872–74), in the famous voyage of deep-sea exploration round the world, he was ordered home to take command of the arctic expedition which set sail in the spring of 1875 in the ships "Alert" and "Discovery." For his services he was made K.C.B. (1876). Two years later he was sent in command of the "Alert" to survey Magellan strait. He retired from active service in 1886, and became a vice-admiral in 1892. He died at Surbiton, Surrey, on Jan. 15, 1915.

He published *Reports on Ocean Soundings and Temperature* (1874–75); and *Narrative of a Voyage to the Polar Sea during 1875–76*, 2 vol. (1878).

NARES, JAMES (1715–1783), English organist and composer, was born at Stanwell, Middlesex, in 1715. His family moved to Oxfordshire, and Nares, as chorister in the Chapel Royal, became a student of William Croft (*q.v.*) and Bernard Gates; he was later a student of John Christopher Pepusch (*q.v.*).

In 1734 Nares, who had been assistant to Francis Pigott, organist at St. George's chapel, Windsor, was appointed organist of York cathedral. Named organist and composer to the king in 1756, he became in 1757 master of the children at Chapel Royal, succeeding his former teacher, Bernard Gates. The Catch club, founded in London in 1761 to encourage the composition and performance of vocal music, awarded him a prize in 1770 for his glee "To all Lovers of Harmony." In July 1780 he resigned from his post at Chapel Royal, and on Feb. 10, 1783, he died in London.

Nares's works include three collections of harpsichord lessons (1748, 1758, 1759); two treatises on singing; *Il Principio, or, A Regular Introduction to Playing on the Harpsichord or Organ* (1759); *The Royal Pastoral* (1767), a dramatic ode; a collection of catches and glees (*c.* 1780); six organ fugues; 20 anthems (1778); and a number of services, canons, and rounds.

NAREW, BATTLES OF THE. The battles on the river Narew, north-east of Warsaw, in July and Aug. 1915, were a part of the great offensive planned by Falkenhayn against Russia. During May and June, Mackensen had driven the Russian armies in Galicia from Tarnów on the Dunajec to the east of Lemberg (*see* DUNAJEC SAN, BATTLES OF THE; LEMBERG, BATTLES OF). In July the group of armies under his command was directed north-east toward Brest-Litovsk against the communications of the Russian forces which still held the Warsaw salient (*see* BREST-LITOVSK, BATTLES OF). Hindenburg, who commanded the group of armies on the northern part of the eastern front, was now ordered to strike a blow on the north side of the salient. Falkenhayn hoped thus by driving in the flanks of the salient to cut off large numbers of Russians in its apex about Warsaw. The realization of this hope depended, of course, on the rapidity with which the flanks could be forced.

Rival German Plans.—The operation against the Narew line provoked a controversy between the two men who had most influence on German strategy during the war, Falkenhayn and Ludendorff. The former was at this time chief of the German Great General Staff, and thus responsible for the supreme direction of the war; the latter was chief of staff to Hindenburg. Ludendorff had long cherished the idea of a Napoleonic manoeuvre against the Russian rear by Kovno and Wilno on Minsk, and considered the proposed Narew offensive as timid and ineffectual; Falkenhayn, with heavier responsibilities on his shoulders, mistrusted both the feasibility and the expedience of the Wilno adventure. He could not afford to become so deeply involved in the Eastern theatre as to be unable to withdraw troops to meet the coming offensive in the West. After a discussion of the alternative plans held in the presence of the kaiser, Falkenhayn's views were approved; and Hindenburg was ordered to carry out the Narew attack.

A formidable water barrier protects Russian Poland against invasion from East Prussia, formed by the Niemen, the Bobr, the Narew and the lower course of the Bug, and thence the Vistula to the frontier. The Russians had fortified this river line. Besides the fortresses of Kovno and Grodno, Osoweic, Lomza and Nowa-Georgiewsk, there were fortified bridge-heads on the Narew at Ostroleka, Rozan, Pultusk and Zegrze. Though the river was fordable in the summer at many points, marshes along its length increased its effectiveness as an obstacle.

The German Attack.—Gallwitz's army, which was to make the attack, comprised six corps (14 divisions). Opposite to it, on the lower Vistula, lay the Russian I. Army (Litvinov) with three corps and a cavalry corps.

The tactical details of the fighting are not of any special interest. On July 13 Gallwitz delivered his first attack on the approximate line Przasnysz-Ciechanów, aiming at Pultusk. The Russians, over-weighted both in numbers and heavy artillery, at once fell back more than half-way to the Narew line. They were attacked again on July 15, and during July 18 and 19 withdrew across the river, the Russian XII. Army on their right conforming to the movement. Reinforcements had now arrived and resistance stiffened. Though the Germans stormed the bridge-heads of Pultusk and Rozan on July 23, and secured crossings over the river, their further progress was limited by violent Russian counter-attacks, and they were unable to reach the line Wyszków-Ostrów (on the lower Bug), at which they were aiming. An attempt to force a passage further east at Ostroleka on July 30 failed, and it was not until Aug. 4 that this bridge-head fell. Losses were heavy on both sides; but the Russians had secured time and space sufficient to evacuate the Warsaw salient without danger.

Hindenburg and Ludendorff naturally claimed that the result of the battle vindicated their opinion on the mistaken strategy of the Supreme Command. Falkenhayn retorted that the operations would have had the desired effect of intercepting the Russian retreat had Hindenburg used the full force available and given Gallwitz 20 divisions instead of 14. It seems doubtful, however, whether the communications would have allowed the effective employment of so large a force.

NARNI (anc. Umbrian *Nequinum*, Rom. *Narnia*), a town and episcopal see of the province of Terni, Italy, 65 m. N. of Rome by rail. Pop. (1936) 4,306 (town), 17,660 (commune). It is picturesquely situated on a lofty rock (787 ft.). The cathedral and the portico of S. Maria Impensole are Romanesque; the former has some good Renaissance sculptures. There are other interesting churches and some picturesque Gothic houses and palaces. There are factories of linoleum and calcium carbide.

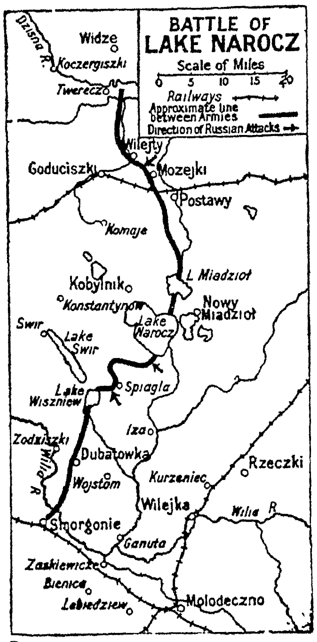
The Umbrian Nequinum was taken by the Romans in 299 B.C., and a colony planted there against the Umbrians. It was situated on the Via Flaminia, and one of the finest bridges of antiquity crosses the river below the town. The original main road ran to Nuceria by Mevania; a branch by Interamna and Spoletium joined it at Forum Flaminii. According to some authors, the emperor Nerva was born at Narnia. The town played a considerable part in military history. In the middle ages Narni was under the papal power. It was the birthplace of the well-known condottiere Erasmo Gattamelata (d. 1443), whose statue by Donatello is at Padua.

See G. Eroli, *Miscellanea Storica Narnese* (2 vols., Narni, 1858–1862), and other works by the same author.

NAROCZ, BATTLE OF LAKE. Lake Narocz, in Poland, 62 mi. E.N.E. of Wilno (Vilna), gives its name to a great offensive by the Russian 2nd Army in the spring of 1916. (*See* WORLD WAR I: *From Verdun to the Entry of America.*)

General Situation on the Eastern Front.—The river Pripet formed the dividing line between the German and Austrian commands. At the beginning of March there were 42 German and

two Austrian divisions on the front north of the Pripet, the total length of which was about 250 miles. The Russians had organized their armies into three groups: the northern (12th and 5th Armies) on the Dvina, the western (1st, 2nd, 10th, 4th and 3rd Armies) extending to south of the Pinsk marshes and the south-western (8th, 11th, 7th and 9th Armies) up to the Rumanian border. Their main strength was concentrated on the northern and western fronts, where it had been decided that the principal efforts of the year should be made. The losses of 1915 in men and material had been made good; guns and munition were available on a larger scale than previously, though still insufficient for the requirements of trench warfare.



PLAN OF THE BATTLE OF LAKE NAROCZ, MARCH 18, 1916

Plan of Operations.—The general idea of the battle was for the 2nd Army to attack on either side of Lake Narocz, where the German line formed a slight salient; the two wings were eventually to join and to continue their advance westwards to Panevežys (some 80m. N. of Wilno [Vilna] and 100m. W. of the original line), where the 5th Army, which was to attack from the Jakobstadt bridgehead on the Dvina, was to join them. The operation seems to have been planned originally to take place later in the year, when all the Allies proposed to attack simultaneously. But on Feb. 21 the German assaults on Verdun began, and the Russians chivalrously hurried on their preparations and attacked to relieve the pressure on the French, at the worst possible time of the year—when the annual thaw, which renders all communications practically impossible for a period, might be expected at any moment.

Description of the Terrain.—Lake Narocz (8m. by 6m.) is the largest of a whole series of small lakes in which the tributaries of the Wilia and the Dzisna rise. It drains into the River Narocz, which flows south to join the Wilia east of Smorgonie. The greater part of the trench line between Dvinsk and Smorgonie (over 100m. in a straight line) was protected by lake, stream or marsh, and stretches of dry ground wide enough for a large scale offensive were few. On either side of Lake Narocz, however, were gaps of four miles or so in the water line, where the terrain was comparatively favourable for attack, though communications were poor. The northern gap was ten miles to the north of Lake Narocz; the southern was between the lake itself and Lake Wiszniew.

Dispositions of the Opposing Forces.—The 2nd Army was divided into three groups: the right group (under Gen. Plyeshkov), opposite the northern gap, consisted of three corps and a cavalry corps; the centre group (under Gen. Sirelius), of two corps; and the left group (under Gen. Baluev), of three corps. Four corps were available behind these groups to exploit any success gained. The right and left groups were to attack the north and south faces of the salient respectively, while the centre group assisted by minor assaults and demonstrations. The army commander, Smirnov, fell sick just before the battle and his place was taken by Gen. Ragoza.

The 2nd Army was opposed by Von Eichhorn's 10th Army on a front of some 85 miles, comprising 11 divisions and two cavalry divisions. The Germans were aware of the Russian concentration.

The Russian Attacks.—A thaw set in on March 17, but the offensive was nevertheless begun on the 18th. After a bombardment of several hours, massed infantry attacks were made both by Plyeshkov's group north of Lake Narocz and by Baluev's group in the south. In the thickly wooded and enclosed terrain the insufficiently trained Russian infantry soon lost cohesion, and their assaults were ill-timed and disjointed. Though the German first-line trenches were in several cases occupied, they could not be held under the concentrated fire of the German artillery, which was extremely skilfully handled. By nightfall the Russians were back in their original positions, having suffered very heavy casualties without result. After two days of further artillery preparation and minor attacks intended to mislead the enemy, renewed heavy assaults were made on the nights of March 19–20 and 20–21.

On Plyeshkov's front no ground was permanently gained in spite of terrible losses, but Baluev's group in the south made an advance of over a mile on a front of about 2½ miles. The weather conditions were by now terrible; it thawed from the 17th to the 22nd, and the whole area of operations became a sea of mud. The battle was, however, continued till March 27, when the Russians at last desisted from their fruitless and costly attacks. In April a German counterstroke retook all the ground gained by Baluev. Meanwhile the attacks of the 5th Army from Jakobstadt, March 21–26, were equally unsuccessful and almost equally wasteful of life.

Results of the Operations.—The operations resulted in a complete and disastrous failure for the Russians. Their losses were over 100,000 and they accomplished nothing. The offensive did not cause the Germans to move a single man from the Western Front, and so brought no relief to the French. Both time and place were ill-chosen; the staff work was bad; and the artillery, in spite of a greater concentration of heavy guns on a narrow front and a more liberal expenditure of ammunition than ever before, failed to give proper support to the infantry, who, as usual, paid the price in terrible losses. The result was, in fact, a bitter disillusionment to the Russian high command, to the Russian soldier and to the Russian people.

BIBLIOGRAPHY.—B. Gourko, *Memories and Impressions of War and Revolution in Russia* (1918); A. W. F. Knox, *With the Russian Army, 1914–17* (1921); E. Ludendorff, *My War Memories* (1922). *See* also WORLD WAR I: *Bibliography*. (A. P. W.)

NARRA or **ASANÁ,** the local names (Philippine dialect) applied to some of the best timber trees, *Pterocarpus indicus*, *P. echinatus* and *P. blancoi* (family Leguminosae) in the Philippine archipelago. The wood is commonly known as "Philippine mahogany," and is in great demand for cabinet-work; it is usually of a beautiful red or rose colour, often variegated with yellow, and is hard and heavy. The trunk is surrounded (or, occasionally, supported) by huge buttresses extending outward and upward for 10 to 20 ft.; these are sometimes made into table-tops, the pattern of the grain and the colouring being hardly equalled by any other timber. The wood-cells contain a peculiar substance: a minute chip placed in a bottle of water soon gives an opalescent colour to the liquid. Narra is known as Burmese rosewood, Andaman redwood and Kiabooca-wood.

NARRAGANSETT PIER, a summer resort of Washington county, Rhode Island, U.S.A., on the west shore of Narragansett bay, 30 mi. S. of Providence. It is on federal highway 1, and is served by the Narragansett Pier railroad, connecting at Kingston (9 mi. N.W.) with the New York, New Haven and Hartford. The town of Narragansett, in which it is situated, had a resident population of 2,275, 1950 (federal census). "The Pier" consists of a group of hotels, a casino and a bathing pavilion, on a crescent-shaped beach (one of the finest on the Atlantic coast), and an avenue (lined on both sides with palatial summer "cottages") running down the rocky promontory to Point Judith (5 m. S.), where there is a lighthouse and a country club. Narragansett Pier was so named from the wharves built late in the 18th century to provide a port for southern Rhode Island, but none of them are left. Development as a summer resort began about the middle of the 19th century, and the railroad from Kingston was completed in 1876. It has always had a considerable number of visitors from the South.

NARSES (*c.* 478–573), an important officer of Justinian, in the 6th century. He was a eunuch of Persamenia, and apparently born about 478. If the statement that he died at the age of ninety-five be correct, he was probably brought young to Constantinople,

and attained a footing in the *officium* of the grand chamberlain. He rose to be one of the three "chartularii," a position involving the custody of the archives of the household. Hence, probably in middle life, he became "praepositus sacri cubiculi."

In 532 the insurrection known as the Nika broke out in Constantinople, when for some hours the throne of Justinian seemed doomed to overthrow. It was saved partly by the courage of his wife, Theodora, and partly by the timely prodigality of Narses, who with large sums of money bribed the leaders of the "blue" faction, which was aforetime loyal to the emperor, to shout as of old "Justiniane Auguste tu vincas." He defeated Totila in 552, with whom fell the last hopes of the Gothic kingdom of Italy.

NARSINGARH, an Indian state in the Bhopal agency of Central India. Area 731 sq.mi.; pop. (1941) 125,178. The chief, whose title is rajah, is a Rajput of the Umat clan. The state was founded about 1681 by a minister of Rajgarh, who compelled the ruler of that state to transfer to him half his territory. The rajah has a salute of 11 guns. The town of Narsingarh had a population in 1931 of 9,241.

NARTHEX, in architecture, a long, narrow porch, usually colonnaded or arcaded, at the entrance of a church. In the early days of Christianity it was the only portion of the church to which catechumens and penitents were admitted. Occasionally an additional vestibule exists within the church building proper. In this case, the inner vestibule is called the narthex and the outer porch an exonarthex. The narthex is common in basilican, Byzantine and some Romanesque churches, particularly in Italy; in the Gothic period its use had almost entirely disappeared, but during the Renaissance it is again found, although its ritual usage had entirely died out, and it had become a simple porch or vestibule.

NARVA, a seaport of Estonia in 59° 23′ N., 28° 12′ E., on the Narova river, 8 mi. above the entry into Narva bay on the Gulf of Finland. Est. pop. (1939) 24,200. With it is associated Narva-Joesuu (Hungerburg) in 59° 28′ N., 28° 2′ E. Pop. 1,635. Vessels of 15½ to 16 ft. draught can load in its harbour. The chief imports are cotton, rye, salt, herrings and coal, and the exports textiles, timber (pit-props, battens, etc.,) spirits and bricks. Fortress Hermann on the west bank and fortress Ivangorod directly across the river dominate the town. The textile mills just above Narva escaped general destruction in World War I partially because of production for the Tsarist army. The cotton mills were closed for two years but eventually resumed production with only 2,000 workers as against 11,000 in 1914. The woollen, flax and jute mills were similarly reduced because Russia, previously the best customer, ceased buying. Estonia developed as a dairy country, and the textile industry was only partially revived. Founded by the Danes in 1223, the town changed hands among the Teutonic Knights, Danes, Swedes and Russians until its capture by Peter the Great in 1704, after which it remained under Russian rule until Estonia obtained independence in 1918–20. Russia again occupied Narva in 1940–41, and it was captured in 1941 by the Germany army.

NARVACÁN, a municipality (with administrative centre and 31 *barrios* or districts) of the province of Ilocos Sur, Luzon, Philippine Islands, near the coast and on the main road 13 mi. S.S.E. of Vigan, the provincial capital. Pop. (1939) 22,769; three were white. It lies in a level valley surrounded by mountains, and the soil of the locality produces palay (rice), maize (corn), cotton, tobacco, maguey and sugar. The women weave cotton cloth for trade with the primitive mountaineers. Ilocano is the vernacular. Of the inhabitants aged 6 to 19 inclusive, 42·8% were reported in 1939 as attending school, while 56·2% of the population 10 years old and over was reported as literate.

NARVAEZ, PÁNFILO DE (*c.* 1480–1528), Spanish adventurer, born at Valladolid. He helped Velasquez in the reduction of Cuba and was put at the head of the force sent to the Aztec coast to compel Cortes to renounce his command. He was defeated by his compatriot and made prisoner (1520). On his return to Spain he obtained from Charles V. a grant of Florida as far as the river of Palms: landing near Pensacola bay in April 1528, he struck inland with some 300 of his followers and reached "Apalache" on June 25. Disillusioned in their hopes of fabulous wealth, they made for the coast, arriving in July at the Bahia de los Caballos, at or near St. Mark's. Having built rude boats, the much-reduced company sailed on Sept. 22, for Mexico, but the vessel which carried Narvaez perished in the storm. His lieutenant, Cabeza de Vaca, and three others ultimately reached the Gulf of California by way of Texas. (*See* FLORIDA.)

See W. H. Prescott, *Conquest of Mexico;* H. H. Bancroft, *Mexico* (1882–90); *Naufragio de Alvaro Nunez Cabeza de Vaca* (Bib. de Autores Esp., xxii.).

NARVAEZ, RAMÓN MARÍA (1800–1868), Spanish soldier and statesman, born at Loja, Granada on Aug. 4. 1800. He served under Mina in Catalonia in 1822. As one of the Conservative supporters of Isabella II. he achieved great popularity by his victory over Gomez, the Carlist general, near Arcos, in Nov. 1836, and after clearing La Mancha of brigands in 1838 he was appointed captain-general of Old Castile, and commander-in-chief of the army of reserve. After taking part in the Seville insurrection (1840) against Espartero and the Progresista party, he fled to France and planned with Maria Cristina the expedition of 1843, which led to the overthrow of his adversary. Prime minister, field-marshal, and duke of Valencia in 1844, his reactionary policy culminated in his having to quit office in Feb. 1846. He became ambassador at Paris, returned (1847) to preside over the council of ministers and resigned (1848) through misunderstandings with Maria Cristina. His ministry succeeded O'Donnell's in 1856–57, 1864–65 and in July 1866. He died at Madrid April 23, 1868.

NARVIK, an ice-free seaport on the Ofoten fjord of the northwest coast of Norway, in Nordland *amt* (county), 68° 30′ N. Pop. (1936) 10,500. It is wholly modern, developed by the construction and completion (1903) of the Lapland railway, the most northerly in the world. From the extensive quays is shipped the iron ore from the Kiruna-Gellivara region across the mountains in Sweden. Narvik is 167 mi. N.W. of Gellivara, 982 mi. from Stockholm by rail. In the warfare of April and May, 1940 British and French recaptured the city and most of the railway from the Germans, then withdrew because of the threat in France.

NARWHAL, a cetacean (*Monodon monoceros*), characterized by the presence in the male of a long horn-like tusk. In the adult of both sexes there are only two teeth, both in the upper jaw, which lie horizontally side by side, and in the female remain throughout life concealed in cavities of the bone. In the male the right tooth usually remains similarly concealed, but the left is immensely developed, attaining a length equal to nearly that of the entire animal. It projects forwards from the head in the form of a cylindrical or slightly tapering, pointed tusk, composed of ivory, with a central cavity reaching almost to the apex, without enamel, and with the surface marked by grooves and ridges running in a left-handed spiral. Occasionally both left and right tusks are developed. In young animals several small additional teeth are present, but these generally disappear soon after birth.

The head is short and rounded; the fore limbs or paddles are small and broad, and (as in the Beluga) a dorsal fin is wanting. The general colour is dark grey variously marbled and spotted with grey.

The narwhal is an Arctic whale rarely seen south of 65° N. lat. Like most cetaceans it is gregarious and usually met with in "schools" of 15 or 20 individuals. Its food appears to be cuttlefishes, small fishes and crustaceans. The purpose served by the tusk is uncertain. The narwhal is extremely playful, individuals frequently elevating their tusks and crossing them with each other as in fencing. They have never been known to charge and pierce the bottom of ships with their weapons as the swordfish does. The ivory of the tusk is of good quality, but owing to the central cavity, only fitted for the manufacture of objects of small size. The entire tusks are sometimes used for decorative purposes. (*See* CETACEA.)

NASCIMENTO, FRANCISCO MANOEL DE (1734–1819), Portuguese poet, known as Filinto Elysio, his "Arcadian" name, though he was never a member of the Arcadia and later was a leader of the revolt against it, was born in Lisbon, the son of a lighterman. As a boy he acquired an extensive knowledge

of national literature and folklore, the foundation of his rich Portuguese vocabulary and of a deep and enduring patriotism. He was ordained priest in 1754, and became treasurer of the Chagas church in Lisbon. Nascimento was soon the centre of a literary group which opposed the ruling group of the Arcadia, and fought for the recognition of Camoens as the greatest of Portuguese poets. But in June 1778 an order was issued by the inquisition for the arrest of Nascimento on the ground of heterodoxy and the reading of "modern philosophers who follow natural reason." He escaped to a French ship in the harbour, found his way to Havre and then to Paris, where he spent the rest of his life, with the exception of five years in the house of the Portuguese ambassador at The Hague. Lamartine addressed an ode to him; he enjoyed the esteem of Chateaubriand; and his admirers at home, who imitated him extensively, were called after him *Os Filintistas.* Exile and suffering had enlarged his ideas and given him a sense of reality, making his best poems those he wrote between the ages of 70 and 85, and when he died it was recognized that Portugal had lost her foremost contemporary poet.

Garrett declared that Nascimento was worth an academy in himself by his knowledge of the language, adding that no poet since Camoens had rendered it such valuable services; but his truest title to fame is that he brought literature once more into touch with the life of the nation. By his life, as by his works, Nascimento links the 18th and 19th centuries, the Neo-Classical period with Romanticism. Wieland's *Oberon* and Chateaubriand's *Martyrs* opened a new world to him, and his *contos* or scenes of Portuguese life have a real romantic flavour; they are the most natural of his compositions, though his noble patriotic odes—those "To Neptune speaking to the Portuguese" and "To the liberty and independence of the United States"—are the most quoted and admired. On leaving Portugal, he abandoned the use of rhyme as cramping freedom of thought and expression; nevertheless, his highly-polished verses are generally robust to hardness and overdone with archaisms.

BIBLIOGRAPHY.—The most useful edition of his collected works is that in 22 vols., 1836–40. *See* Innocencio da Silva, *Diccionario bibliographico Portuguez,* ii. 446–457 and ix. 332–336; also Pereira da Silva, *Filinto Elysio e a sua Epoca* (Rio, 1891); and Dr. Theophilo Braga, *Filinto Elysio* (Oporto, 1891).

NASEBY, a village of Northamptonshire, England, 7m. S.S.W. of Market Harborough, famous as the scene of the battle of June 14, 1645, which decided the issue of the first Civil War (*see* GREAT REBELLION). The army of King Charles I. was less than 10,000 strong, while the "New Model" army of the parliament, commanded by Sir Thomas Fairfax, numbered some 13,000. Yet it was not without considerable hopes of victory that the Royalists drew up for battle, for although Lieutenant-General Cromwell had made the New Model cavalry formidable indeed, the Royalist foot had become professionalized in several years of war, whereas the Parliamentarian foot was newly organized, and in part at least but half-trained. Fairfax and Cromwell, however, were still more confident, and with better reason. The battlefield lies between Naseby and Sibbertoft (3m. N. of Naseby) and is an undulating ridge which, near the centre of England, forms the "divide" between the Avon and the Welland rivers. Across this ridge the two armies were drawn up, the New Model facing north and the king's army south, the horse on the flanks and the foot in the centre of each army.

At the first shock the Royal foot asserted its superiority over the opposing infantry, four out of five regiments in the first line were broken, and Skippon, the major-general of the foot, was wounded. But Fairfax's regiment held its ground, until the second line of infantry advanced and re-established the front. Meantime the Royalist right wing of horse, led by Prince Rupert, had completely routed the horse of Colonel Ireton which opposed them. But the victors as usual indulged in a disorderly pursuit, and attempted to overpower the baggage guard of the enemy near Naseby village. Their incoherent attack was repulsed, and when Rupert, gathering as many of his men as he could, returned to the battlefield, the decisive stroke had been delivered by Cromwell and the right wing of Parliamentary horse. In front of him, in somewhat broken ground, was Sir Marmaduke Langdale's cavalry, which the lieutenant-general with his own well-trained regiments scattered after a short, fierce encounter. Cromwell's "godly" troopers did not scatter in pursuit. A few squadrons were ordered to keep the fugitives on the run, and with the rest, and such of Ireton's broken troops as he could gather, Cromwell attacked the Royalist centre in rear while Fairfax and his foot pressed it in front. Gradually the Royalist infantry, inferior in numbers, was disintegrated into small groups, which surrendered one after the other. But one brigade, called the "Bluecoats," held out to the last, and was finally broken by a combined charge of Fairfax's regiment of foot, led by Cromwell, and the general's personal escort, led by Fairfax himself, who captured a colour with his own hand. The remnant of the king's army, re-formed by Rupert, stood inactive and irresolute while its infantry was being destroyed and then fled. The spoils included 100 standards and colours and the king's private papers. But more important than trophies was the practical annihilation of the last field army of which the king disposed. Half the Royalists were captured, and about 1,000 fell in the battle and the pursuit. In addition all the artillery and the muskets (to the number of 8,000) and ammunition without which the king could scarcely create a new army were lost.

NASH, PAUL (1889–1946), British painter, was born in London on May 11, 1889, and educated at St. Paul's school and at the Slade school. His first exhibition was given in 1911, but he was comparatively little known until an exhibition of his western front war pictures (1918), the fruit of his work as an official artist 1917–18; several of these are in the Imperial War museum, London. He then attracted attention as a landscape painter of individuality and charm, a somewhat mannered technique giving way gradually to a freer expression; he gave an important exhibition in London in 1924. He also produced some interesting woodcuts and book illustrations, such as the wood engravings, "Genesis" (1924). He was instructor of design at the Royal College of Art, South Kensington, 1924–25. He was also an official artist during World War II. He died on July 11, 1946.

NASH, RICHARD (1674–1762), English dandy, better known as "Beau Nash," was born at Swansea on Oct. 18, 1674. He was educated at Carmarthen grammar school and at Jesus college, Oxford. He obtained a commission in the army, which however, he soon exchanged for the study of law at the Temple. Here among "wits and men of pleasure" he came to be accepted as an authority in regard to dress, manners and style. When the members of the Inns of Court entertained William III. after his accession, Nash conducted the pageant at the Middle Temple. He was offered knighthood, but he declined the honour, unless accompanied by a pension. The pension was not given and Nash turned gamester. In 1705 he succeeded Captain Webster as master of the ceremonies at Bath. Under his régime Bath became the leading fashionable watering-place. He drew up a new code of rules for the regulation of balls and assemblies, abolished the habit of wearing swords in places of public amusement and brought duelling into disrepute, induced gentlemen to adopt shoes and stockings in parades and assemblies instead of boots, reduced refractory chairmen to submission and civility, and introduced a tariff for lodgings. Through his exertions a handsome assembly-room was also erected, and the streets and public buildings were greatly improved. Nash adopted an outward state corresponding to his nominal dignity. He wore an immense white hat as a sign of office, and a dress adorned with rich embroidery, and drove in a chariot with six greys, laced lackeys and French horns. When the act of parliament against gambling was passed in 1745, he was deprived of an easy though uncertain means of subsistence, but the corporation afterwards granted him a pension of six score guineas a year, which, with the sale of his snuff-boxes and other trinkets, enabled him to support a certain faded splendour till his death on Feb. 3, 1762. He was honoured with a public funeral at the expense of the town. He was a man of strong personality, and considerably more able than Beau Brummell, whose prototype he was.

See Oliver Goldsmith, *Life of Richard Nash* (1762); Lewis Melville, *Bath under Beau Nash* (1908), with full list of authorities.

NASHE (or NASH), **THOMAS** (1567–1601), English poet, playwright and pamphleteer, was born at Lowestoft in 1567. His father belonged to a Herefordshire family, and is vaguely described as a "minister." Nashe spent 6 years, 1582–1588, at St. John's College, Cambridge, taking his B.A. degree in 1586. On leaving the university he tried, like Greene and Marlowe, to make his living in London by literature. It is probable that his first effort was *The Anatomie of Absurditie* (1588) which was perhaps written at Cambridge, although he refers to it as a forthcoming publication in his preface to Greene's *Menaphon* (1589). In this preface, addressed to the gentlemen students of both universities, he makes boisterous ridicule of the bombast of Thomas Kyd and the English hexameters of Richard Stanihurst, but does not forget the praise of many good books. Nashe was really a journalist born out of due time; he boasts of writing "as fast as his hand could trot"; he had a brilliant and picturesque style which, he was careful to explain, was entirely original; and in addition to his keen sense of the ridiculous he had an abundance of miscellaneous learning.

As there was no market for his gifts he fared no better than the other university wits who were trying to live by letters. But he found an opening for his ready wit and keen sarcasm in the famous Martin Marprelate controversy. His share in this war of pamphlets cannot now be accurately determined, but he has been credited, on doubtful evidence, with the following: *A Countercuffe given to Martin Junior* (1589), *Martins Months Minde* (1589), *The Returne of the renowned Cavaliero Pasquill and his Meeting with Marforius* (1589), *The First Parte of Pasquils Apologie* (1590), and *An Almond for a Parrat* (1590). He edited an unauthorized edition of Sidney's poems in 1591, and *A Wonderfull Astrologicall Prognostication,* in ridicule of the almanacmakers, by "Adam Fouleweather," which appeared in the same year, has been attributed to him. *Pierce Penilesse, His Supplication to the Divell,* published in 1592, shows us his power as a humorous critic of national manners, and tells incidentally how hard he found it to live by the pen. It seems to Pierce a monstrous thing that brainless drudges wax fat while "the seven liberal sciences and a good leg will scarce get a scholar bread and cheese."

In this pamphlet, too, Nashe began his attacks upon the Harveys by assailing Richard, who had written contemptuously of his preface to Greene's *Menaphon.* Greene died in September 1592, and Richard's brother, Gabriel Harvey, at once attacked his memory in his *Foure Letters,* at the same time adversely criticizing *Pierce Penilesse.* Nashe replied, both for Greene and for himself, in *Strange Newes of the intercepting certaine Letters,* better known, from the running title, as *Foure Letters Confuted* (1592), in which all the Harveys are violently attacked. The autumn of 1592 Nashe seems to have spent at or near Croydon, where he wrote his satirical masque of *Summers Last Will and Testament* at a safe distance from London and the plague. He afterwards lived for some months in the Isle of Wight under the patronage of Sir George Carey, the governor. In 1593 he wrote *Christs Teares over Jerusalem,* in the first edition of which he made friendly overtures to Gabriel Harvey. These were, however, in a second edition, published in the following year, replaced by a new attack, and two years later appeared the most violent of his tracts against Harvey, *Have with you to Saffron-walden, or, Gabriell Harveys Hunt is up* (1596). In 1599 the controversy was suppressed by the archbishop of Canterbury.

After Marlowe's death Nashe prepared his friend's unfinished tragedy of *Dido* (1596) for the stage. In the next year he was in trouble for a play, now lost, called *The Isle of Dogs,* for only part of which, however, he seems to have been responsible. The "seditious and slanderous matter" contained in this play induced the authorities to close for a time the theatre at which it had been performed, and Ben Jonson (*q.v.*) and others were imprisoned. Apparently Nashe escaped. Besides his pamphlets and his play-writing, Nashe turned his energies to novel-writing. He may be regarded as the pioneer in the English novel of adventure. He published in 1594 *The Unfortunate Traveller, Or the Life of Jack Wilton,* the history of an ingenious page who was present at the siege of Térouenne, and afterwards travelled in Italy with the earl of Surrey. It tells the story of the earl and Fair Geraldine, describes a tournament held by Surrey at Florence, and relates the adventures of Wilton and his mistress Diamante at Rome after the earl's return to England. The detailed, realistic manner in which Nashe relates his improbable fiction resembles that of Defoe.

His last work is entitled *Lenten Stuffe* (1599) and is nominally "in praise of the red herring," but really a description of Yarmouth, to which place he had retired after the trouble over *The Isle of Dogs.* Nashe's death is referred to in Thomas Dekker's *Knight's Conjuring* (1607), a kind of sequel to *Pierce Penilesse.* He is there represented as joining his boon companions in the Elysian fields "still haunted with the sharp and satirical spirit that followed him here upon earth." Had his patrons understood their duty, he would not, he said, have shortened his days by keeping company with pickled herrings. The date of his death is fixed by an elegy on him printed in Fitzgeffrey's *Affaniae* (1601).

The works of Thomas Nashe were edited by Dr. A. B. Grosart in 1883–85, and by Ronald B. McKerrow (1904–1910). *See* also *English Novel in the Time of Shakespeare,* by J. J. Jusserand (Eng. trans., 1890); and F. G. Harman, *Gabriel Harvey and Thomas Nashe* (Ouseley, 1923).

NASHUA, a city of southern New Hampshire, U.S.A., on the Merrimack river at the mouth of the Nashua, 15 mi. S. of Manchester and 40 mi. N.W. of Boston; one of the county seats of Hillsboro county. It is on federal highway 3, and is served by several divisions of the Boston and Maine railroad. Pop. (1950) 34,666; (1940) 32,927 by the federal census.

Nashua is beautifully situated in an amphitheatre of hills and mountains. There is abundant water power, and the city has extensive manufactures (notably of cotton goods, paper, asbestos, shingles, shoes, machinery and refrigerators). A U.S. fish hatchery is near by.

A settlement known as Indian Head was established there in 1665. In 1803 it was incorporated as the village of Nashua, and in 1836 the town of Dunstable (in which it was situated) took the same name. The town of Nashville was set off from the town of Nashua in 1842, but the two were reunited in 1853 under a city charter.

NASHVILLE, the capital city of Tennessee, U.S., a port of entry, and the county seat of Davidson county; on the Cumberland river in the north central part of the state. It is on federal highways 31, 41 and 70; has two municipal airports; and is served by the Louisville and Nashville, the Nashville, Chattanooga and St. Louis and the Tennessee Central railways, by American and Eastern air lines, motorbus lines and river barges. Pop. (1950) 173,359; it was 167,402 in 1940 (28.3% Negroes and 99.1% native-born).

The city covers 22.327 sq.mi., on hills and bluffs averaging 500 ft. above sea level, in a vast undulating elliptical valley of 5,450 sq.mi. The surrounding country is a blue-grass region of great fertility. Within 25 mi. of the city practically everything is raised that is needed for food and clothing and most of the necessities of life are manufactured. Seven bridges cross the river. On the highest hill stands the state capitol, a fine example of pure Greek architecture, with a cupola 205 ft. high.

The tomb of Pres. James K. Polk is on the capitol grounds, and 11 mi. east of the city is "The Hermitage," the beautiful plantation home of Pres. Andrew Jackson. In Centennial park, where the Tennessee Centennial exposition was held in 1897, is a reconstruction of the Parthenon. Mt. Olivet cemetery contains a beautiful monument to the Confederate soldiers, surrounded by 2,000 of their graves, and north of the city is a national cemetery where 16,862 Federal soldiers are buried. A memorial to the soldiers and sailors of World War I (covering two blocks and containing a large auditorium) was erected by the city, the county and the state, at a cost of $2,600,000. The Tennessee state fair is held at Nashville annually.

Many of the state institutions are situated in Nashville, including the Tennessee Industrial school, the Tennessee School for the Blind, the Central State Hospital for the Insane, the penitentiary, and the Training and Agricultural school for boys.

The public parks cover 3,618 ac.; the hotels have 2,000 guest-rooms; there are 366 churches, including a Roman Catholic cathedral, 49 public schools and 50 under private auspices. The city's assessed valuation for 1949 was $232,513,451. It operates under a councilmanic form of government with a mayor as administrative head.

Nashville is one of the foremost educational centres in the south. Vanderbilt university (founded in 1873 by Commodore Vanderbilt) has grounds and buildings valued at $9,772,685, endowment of $31,255,787 and an enrolment (1949–50) of 3,397. Its medical school was housed in 1925 in a well equipped and comprehensive plant, built with grants from the General Education board and the Carnegie corporation and earlier gifts from Andrew Carnegie.

The George Peabody College for Teachers (opened as a normal school in 1875) has an endowment of $4,607,261 and an enrolment (1949–50) of more than 3,000.

Fisk university (for Negroes), started in 1865 by the American Missionary association and the Western Freedmen's Aid commission, has buildings and grounds valued at $1,770,561, endowment funds of $4,486,947, and an annual enrolment of about 900. The Fisk Jubilee Singers, sent out first in 1871 to raise money for a dormitory for women, have sung in most of the large cities of America and Europe.

Nashville is also the seat of the Tennessee Agricultural and Industrial State college and the Meharry Medical college (both for Negroes).

The Nashville industrial area manufactures a variety of products. Ranking first is the manufacture of chemicals for industrial, commercial and agricultural use, including production of rayon and cellophane. Of major importance is the printing and publishing industry, especially the production of religious periodicals and books.

Other manufactures are food, clothing, shoes, textile products, lumber and building materials, heating and cooking equipment, furniture and transportation equipment.

History.—In Nov. 1779, James Robertson and a party of companions, who had set out in February from the Watauga settlements in eastern Tennessee to establish an "advance guard of civilization" in the rich central basin, arrived at the spot where Nashville now stands, and decided to make it the site of the new settlement. They were joined a few months later by their wives and children and other pioneers, under Col. John Donelson. The town (called Nashborough until its incorporation in 1784) was named for Francis Nash of North Carolina, a Revolutionary general, killed at Germantown.

In 1806 Nashville was chartered as a city. From 1812 (except from 1815 to 1826) the legislature met there, and in 1843 it was made the State capital.

On June 3, 1850, it was the scene of the Southern, or Nashville, convention, attended by 100 delegates from nine states, which denounced the Wilmot Proviso and (at an adjourned meeting in November) expressed disapproval of the Compromise Measures and asserted the right of the south to secede. For the battle of Nashville (1864) *see* below. During World War I the government established the Old Hickory Powder plant across the river, constructing large factory buildings and a village to accommodate 30,000 persons. (X.)

BATTLE OF NASHVILLE

During the Civil War Nashville was captured by the Federals (Feb. '62) after the fall of Fort Donelson and remained in their hands till the end. The battle of Nashville was fought (Dec. 15–16, '64) between a Federal army under G. H. Thomas and *Hood's* Army of Tennessee, and resulted in the complete overthrow of the Confederates. *Hood* had reached the Tennessee at Tuscumbia at the end of October, but waited there three weeks to accumulate a stock of supplies and enable *Forrest's* cavalry to join him. This delay proved fatal to his chance of capturing Nashville, before Thomas, whom Sherman had left to meet *Hood's* invasion whilst he himself "marched to sea," could concentrate sufficient forces for its defence. Thomas had under his command two corps and about 5,000 cavalry under Wilson, in addition to the local garrisons dispersed along the lines of communication from Chattanooga to the Ohio. Until a third corps under A. J. Smith reached him from Missouri (Nov. 30), he can hardly be said to have had a field army at all. *Hood* intended, after capturing Nashville, to invade Kentucky and carry the war to the Ohio. He even contemplated the possibility of marching through the Cumberland mountains to *Lee's* help and attacking Grant. He advanced from the Tennessee (Nov. 21) and endeavoured to outflank Schofield, whom Thomas had placed at Pulaski, 80 m. from Nashville, with the IV. Corps and one division of the XXIII., and about 4,000 cavalry to retard *Hood's* advance, and cut him off from Columbia, where the Nashville railway crossed the Duck river. But Cox's division, by a forced march, saved Columbia from capture by *Forrest*. Wishing to preserve the railway bridge for use when the Federals should take the offensive, Schofield, who had been reinforced by two more infantry brigades, tried to hold on to the south bank, but *Forrest* crossed with his cavalry above the town (Nov. 28), and driving Wilson's mounted troops away from the Franklin road, opened the way for *Hood's* infantry to cut off Schofield's retreat. Next day seven Confederate divisions crossed the river and advanced towards Spring Hill, 11 m. in Schofield's rear, where only a single division was covering the movement of the Federal trains. *Hood* here lost the greatest opportunity offered to any general in the war. He allowed Schofield to escape and make good his retreat to Franklin, on the Harpeth. Schofield was obliged to make another stand there to get his trains across the river. *Hood* made a furious and ill-prepared assault on the strong Federal position late in the afternoon (Nov. 30). The battle raged till 9 P.M., when *Hood* called off his troops, which had suffered terrible losses, and Schofield reached Nashville next day. *Hood's* last chance of conducting a successful offensive was gone, but he continued to follow Schofield and appeared before Nashville (Dec. 2). He believed that retreat would be more demoralizing to his troops than an honourable defeat, and the trans-Mississippi reinforcements promised by the President might yet arrive. Thomas was almost ready to take the offensive. Besides Smith's corps he had just received Steedman's "provisional division" from Chattanooga. He could now put into the field a force probably double the size of *Hood's*. But he needed a few more days in order to remount his large cavalry force, which was intended to play a decisive part in *Hood's* annihilation. Grant grew impatient at the delay. He had expected Thomas to stop *Hood* south of the Duck river, but *Hood* had reached the Cumberland. He bombarded Thomas with telegrams, demanding an immediate attack. Just as Thomas was ready, a storm of freezing rain came on, which covered the ground with a sheet of ice and prevented military operations till a thaw came. Grant ordered (Dec. 9) that Thomas should be superseded by Schofield; suspended the order the same day; ordered (Dec. 13) Logan to Nashville to take command, unless Thomas had moved in the meantime; finally, set out himself to Washington (Dec. 15), intending to go on to Nashville. But the thaw came (Dec. 14) and Thomas attacked next day.

Hood's line ran from the Chattanooga railway on the right across the Franklin and Granny White turnpikes to the Hillsboro' road. His left was sharply refused, extending 1,000 yards behind a stone wall alongside that road. He had thrown up some redoubts on detached hills beyond his left, and established a strong skirmish line along his front, terminating on Montgomery hill, close to the Hillsboro' road. But the line was too long to be held by his attenuated force, and his left was very much "in the air." Having detached *Forrest* with two cavalry divisions to raid the Chattanooga railway, he had but one division left to watch the wide gap between his left and the river. Thomas's plan of battle was to make a grand left wheel with his right wing, consisting of Wilson's 12,000 cavalry, fighting dismounted, and Smith's corps, which should outflank and crush the enemy left, whilst Steedman's division held their right fast by a vigorous demonstration. The IV. Corps under Wood was to storm Montgomery hill and press in upon the Confederate salient on the Hillsboro' road. Schofield's corps was at first held in reserve,

but was finally thrown in between Wilson's and Smith's corps. Had not the Federal advance been delayed by fog in the early morning, *Hood* would probably have been completely defeated on the 15th. His whole left wing was driven back in great confusion to the Granny White turnpike. Darkness stopped the pursuit, but *Hood,* who dared not retreat because *Forrest* could not rejoin for at least 24 hours, during the night formed a fresh and much shorter line 2 m. further back, each flank resting upon a hill. *Cheatham's* corps was shifted from the right to the left, which again was sharply bent back just beyond the Granny White turnpike, and extended to the Brentwood hills along a line of lesser heights. *S. D. Lee's,* which had scarcely fired a shot the previous day, held the right, and *A. P. Stewart's,* after its heavy defeat, was placed in the centre. But again Wilson's dismounted troopers, fighting their way through the smaller hills, turned the Confederate left, and getting into its rear attacked from behind, whilst Schofield and Smith assaulted its front. Under this double pressure *Cheatham's* corps broke and with its flight *Hood's* resistance collapsed, although earlier in the day an attack by Wood and Steedman on the right had been handsomely repulsed. His army fled down the Franklin turnpike, the only line of retreat left. But two brigades, which retained their organization, and *Chalmers's* cavalry division held the Brentwood hill's passes long enough to enable the larger part of *Hood's* army to escape. The Federals took up the pursuit next day, hoping to intercept the flying enemy on the Duck river, but *Forrest,* who rejoined *Hood* at Columbia, organized a rearguard with his cavalry and eight infantry brigades under *Walthall,* and covered the retreat to the Tennessee, which was recrossed (Dec. 27). Thomas's fighting force at Nashville numbered between 50,000 and 55,000 men; his casualties were just over 3,000. *Hood* estimated his own force at 23,000, but this is almost certainly an understatement; some authorities put it as high as 39,000. He made no return of his casualties, but stated that they were "very small." But Thomas captured nearly 4,500 prisoners in the battle itself, and many more were taken during the ten days' pursuit.

(W. B. Wo.)

NASI, JOSEPH (16th century), Jewish statesman and financier, was born in Portugal of a Jewish (Marano) family. Emigrating from his native land, he founded a banking house in Antwerp. Despite his financial and social prosperity there, he felt it irksome to be compelled to wear the guise of Catholicism, and determined to settle in a Mohammedan land. After two troubled years in Venice, Nasi betook himself to Constantinople. Here he proclaimed his Judaism, and married his beautiful cousin Reyna. He rapidly rose to favour, the sultans Suleiman and Selim promoting him to high office. He founded a Jewish colony at Tiberias which was to be an asylum for the Jews of the Roman Campagna. In 1566 when Selim ascended the throne, Nasi was made duke of Naxos. He had deserved well of Turkey, for he had conquered Cyprus for the sultan. Nasi's influence was so great that foreign powers often negotiated through him for concessions which they sought from the sultan. Thus the emperor of Germany, Maximilian II., entered into direct correspondence with Nasi; William of Orange, Sigismund August II., king of Poland, also conferred with him on political questions of moment. On the death of Selim in 1574, Nasi receded from his political position, but retained his wealth and offices, and passed the rest of his life at Belvedere (Constantinople). He died in 1579.

See Graetz, *History of the Jews* (Eng. trans.), vol. iv. chs. xvi.–xvii.; *Jewish Encyclopedia,* ix. 172. (I. A.)

NASIK, a town and district of British India, in the Central division of Bombay. The town is on the Godavari river, connected by a tramway (6 mi.) with Nasik Road railway station, 107 mi. N.E. of Bombay. Pop. (1941) 52,386. It is a very holy place of Hindu pilgrimage, being 18 mi. from the source of the Godavari, and a large number of Brahman priests live here. Shrines and temples line the river banks, and in the vicinity there are a number of sacred caves, among which those of Pandu Lena are the most noteworthy. They are ancient Buddhist caves dating from the 3rd century before Christ to the 6th century after, with numerous inscriptions of the highest historical value. Nasik has manufactures of brass and copper ware, and there is a government distillery at Nasik Road.

The District of Nasik has an area of 5,922 sq.mi. With the exception of a few villages in the west, the whole district is situated on a tableland from 1,300 to 2,000 ft. above sea-level. The western portion is hilly, and intersected by ravines. The eastern tract is open, fertile and well cultivated. The Sahyadri range stretches from north to south; the watershed is formed by the Chander range, which runs east and west. All the streams to the south of that range are tributaries of the Godavari. To the north of the watershed, the Girna and its tributary the Mosam flow through fertile valleys into the Tapti. The Girna Left Bank Canal, irrigating some 4,000 acres, was opened in 1909. It contains several old hill forts, the scenes of many engagements during the Mahratta wars. Nasik district became British territory in 1818 on the overthrow of the peshwa. The population in 1941 was 1,113,901. The principal crops are millet, wheat, pulse, oil-seeds and cotton and fine grapes and vegetables are grown. There is a trade in copper and brass ware, and sugar cane. There are railway workshops at Igatpuri. At Sharanpur is a Christian village, with an orphanage of the Church Missionary Society. The district is crossed by the main line of the Great Indian Peninsula railway.

NASMYTH, ALEXANDER (1758–1840), Scottish portrait and landscape painter, was born in Edinburgh on Sept. 9, 1758. He studied at the Trustees' Academy under Runciman, and became apprenticed as heraldic painter to a coach-builder. At the age of 16 he attracted the attention of Allan Ramsay, who took him to London, and employed him upon the subordinate portions of his works. Nasmyth returned to Edinburgh in 1778, and was soon largely patronized as a portrait painter. He also assisted Mr. Miller of Dalswinton, as draughtsman, in his mechanical researches and experiments; and through his generosity was able to go to Italy, where he remained two years. On his return he painted the portrait of Burns, now in the Scottish National Gallery and well known through Walker's engraving. Nasmyth's pronounced Liberal opinions gave offence to many of his aristocratic patrons, and led to the diminution of his practice as a portraitist. In his later years, accordingly, he worked mainly at landscapes, and occasionally at scene-painting. He has been styled the "father of Scottish landscape art." His subjects are carefully finished and coloured, but are wanting in boldness and freedom.

Nasmyth was also largely employed by noblemen throughout the country in the improving and beautifying of their estates, in which his fine taste rendered him especially skilful. As an architect, he is known for his designs for the Dean Bridge, Edinburgh, and the graceful circular temple covering St. Bernard's Well. Nasmyth died in Edinburgh on April 10, 1840. His youngest son, James, was the well-known inventor of the steam-hammer. His eldest son, Patrick (1787–1831), became a clever landscapist.

For an account of the Nasmyth family *see* James Nasmyth's *Autobiography* (1883).

NASMYTH, JAMES (1808–1890), Scottish engineer, inventor of the steam-hammer, was born in Edinburgh on Aug. 19, 1808, and was the youngest son of Alexander Nasmyth, the "father of Scottish landscape art." He started business in Manchester on his own account in 1834, and in a few years he was at the head of the prosperous Bridgewater foundry at Patricroft, from which he was able to retire in 1856 with a fortune. The invention of the steam-hammer, with which his name is associated, was actually made in 1839, a drawing of the device appearing in his note-book, or "scheme-book," as he called it, with the date Nov. 24 of that year. It was designed to meet the difficulty experienced by the builders of the "Great Britain" steamship in finding a firm that would undertake to forge the large paddle-wheel shaft required for that vessel, but no machine of the kind was constructed till 1842. In that year Nasmyth discovered one in Schneiders' Creuzot works, and he found that the design was his own and had been copied from his "scheme-book." Apparently, however, he was anticipated in the idea by James Watt. Nasmyth did much for the improvement of machine-tools, and his inventive genius devised many new appliances—a planing-machine ("Nasmyth steam-arm"), a nut-shaping machine, steam pile-driver, hydraulic machinery for various purposes, etc. On his retirement

he lived at Penshurst in Kent, and amused himself with the study of astronomy, and especially of the moon, on which he published a work, *The Moon considered as a Planet, a World and a Satellite,* in conjunction with James Carpenter in 1874. He died in London on May 7, 1890.

His *Autobiography* (edit. Samuel Smiles) was published in 1883.

NASR-ED-DIN [NĀṢIRU'D-DIN] (1829–1896), shah of Persia, was born on April 4, 1829. His mother, a capable princess of the Kajar family, persuaded Shah Mohammed, his father, to appoint him heir apparent, in preference to his elder brothers; and he was accordingly made governor of Azerbaijan. His succession to the throne, Oct. 13, 1848, was vigorously disputed, especially by the followers of the reformer El Bab, upon whom he wreaked terrible vengeance. In 1855 he reestablished friendly relations with France, and coming under the influence of Russia, signed a treaty of amity on Dec. 17 with that power, but remained neutral during the Crimean War. In 1856 he seized Herat, but a British army under Outram landed in the Persian gulf, defeated his forces and compelled him to evacuate the territory. The treaty of peace was signed at Paris, on March 4, 1857, and to the end of his reign he treated Great Britain and Russia with equal friendship. In 1866 the shah authorized the passage of the telegraph to India through his dominions and reminted his currency in the European fashion. In 1873, and again in 1889, he visited England in the course of his three sumptuous journeys to Europe, 1873, 1878, 1889.

The only results of his contact with Western civilization appear to have been the proclamation of religious toleration, the institution of a postal service, accession to the postal union and the establishment of a bank. He gave the monopoly of tobacco to a private company, but was soon compelled to withdraw it in deference to the resistance of his subjects. Abstemious in habits, and devoted to music and poetry, he was a cultured, able and well-meaning ruler, and his reign, already unusually long for an Eastern potentate, might have lasted still longer had it not been for the unpopular sale of the tobacco monopoly, which was probably a factor in his assassination at Teheran on May 1, 1896, by a member of the Babi faction. He was succeeded by his son Muzaffar-ed-din.

NASRIDES, THE, of Granada, were the last of the Mohammedan dynasties in Spain. They ruled from 1232 to 1492. The dynasty was of remote Arabic origin, but its immediate source was the mountain range of the Alpujarra, and the founder was Yusuf (or Yahīa) l'Nasr, a chief who was engaged in conflict with the family of Beni-Hud, once kings at Saragossa, who held the fortress of Granada. Yusuf's nephew (or son) Mohammed completed the defeat of the Beni-Hud largely by the help of the king of Castile, to whom he did homage and paid tribute. From Mohammed I., called el Ghalib, *i.e.,* the Conqueror (1238–73), to Mohammed XI., called Boabdil, and also the little king "El Rey Chico" by the Christians, who lost Granada in 1492, there are counted 29 reigns of the Nasrides, giving an average of nine years. But there was not the same number of sultans, for several of them were expelled and restored two or three times. There were also contemporary reigns in different parts, and tribal or local rivalries between plain and hill, and the chief towns, Granada, Malaga and Guadix. The dissensions of the Nasrides reached their greatest pitch of fury during the very years in which the Catholic sovereigns were conquering their territory piecemeal, 1482–92.

See M. Lafuente Alcantara, *Historia de Granada* (Granada, 1884); S. Lane-Poole, *The Mohammedan Dynasties* (1894).

NASSAU, a territory of Germany, now forming the bulk of the government district of Wiesbaden, in the Prussian province of Hesse-Nassau, but until 1866 an independent and sovereign duchy of Germany. It consists of a territory, 1,830 sq.m. in area, divided into two nearly equal parts by the river Lahn and bounded on the south and west by the Main and Rhine, on the north by Westphalia and on the east by Hesse. The southern half is almost entirely occupied by the Taunus mts., while to the north of the Lahn is the barren Westerwald. The valleys and low-lying districts, especially the Rheingau, are very fertile, producing abundance of grain, flax, hemp and fruit; but by far the most valuable product of the soil is its wine. Nassau is one of the most thickly wooded regions in Germany, and its forests yield good timber and harbour large quantities of game while the rivers abound in fish. There are upwards of a hundred mineral springs in the district; the best known are those of Wiesbaden and Ems. Other mineral wealth of Nassau includes iron, lead, copper, building stone, coals, slate, a little silver and a bed of malachite. Manufactures are unimportant, but brisk trade is carried on by rail and river in wine, timber, grain and fruit. There are few places of importance besides the above-named spas; Höchst is the only manufacturing town. Wiesbaden is the capital. The population of Hesse-Nassau in 1939 was 2,688,922.

History.—During the Roman period the whole of the district of Nassau was occupied by the Mattiaci and later by the Alamanni. The latter were subdued by the Franks under Clovis at the end of the 5th century, and at the partition of Verdun in 843 the country became part of the East Frankish or German kingdom. Christianity seems to have been introduced in the 4th century. The founder of the house of Nassau is usually regarded as a certain Drutwin (d. 1076), who built a castle on a hill overlooking the Lahn, near the present town of Nassau. Drutwin's descendant Walram (d. 1198) took the title of count of Nassau, and placed his lands under the immediate suzerainty of the German king; previously he had been a vassal of the archbishop of Trier. Then in 1255 Walram's grandsons, Walram and Otto, divided between them their paternal inheritance, which had been steadily increasing in size. Walram took the part of Nassau lying on the left bank of the Lahn and made Weisbaden his residence; Otto took the part on the right bank of the river and his capital was Siegen. The brothers thus founded the two branches of the house of Nassau.

The fortunes of the Ottonian, or younger line, belong mainly to the history of the Netherlands. William the Silent, the best known of this line, and his descendants were called princes of Orange-Nassau, and this line became extinct when the English king William III. died in 1702. The descendants of Count John, his brother, remained rulers of Nassau until 1806, when the reigning prince, William VI., was deprived of his lands because he refused to join the Confederation of the Rhine. Some of them were given in 1815 to the other main line of the family, the one descended from Count Walram. In 1815 William VI. became king of the Netherlands as William I., and was compensated for this loss by the grant of parts of Luxemburg and the title of grand-duke. When in 1890 William's male line died out Luxemburg, like Nassau, passed to the descendants of Count Walram. In the female line he is now represented by the queen of the Netherlands.

The territories possessed by the other branch of the house of Nassau were partitioned several times, and only in 1816 was the whole of Nassau united under the rule of Frederick William of Nassau-Weilburg as duke of Nassau. In 1866 Duke Adolph espoused the cause of Austria, sent his troops into the field, and asked the landtag for money. This was refused; Adolph was soon a fugitive before the Prussian troops, and on Oct. 3, 1866, Nassau was formally incorporated with the kingdom of Prussia.

For the history of Nassau *see* Hennes, *Geschichte der Grafen von Nassau bis 1255* (Cologne, 1843); von Schütz, *Geschichte des Herzogtums Nassau* (Wiesbaden, 1853); von Witzleben, *Genealogie und Geschichte der Fürstenhauses Nassau* (Stuttgart, 1855); F. W. T. Schliephake and K. Menzel, *Geschichte von Nassau* (Wiesbaden, 1865–89); the *Codex diplomaticus nassoicus,* ed. K. Menzel and W. Sauer (1885–87); and the *Annalen des Vereins für nassauische Altertumskunde und Geschichtsforschung* (1827 f.).

NAST, THOMAS (1840–1902), American caricaturist, was born on Sept. 27, 1840, in Landau, Germany. His mother took him to New York in 1846. He studied art there with Theodore Kaufmann and at the school of the National Academy of Design. At the age of 15 he became a draughtsman for *Frank Leslie's Illustrated Newspaper;* three years later for *Harper's Weekly.* In 1860 he went to England for the *New York Illustrated News* and soon afterwards joined Garibaldi in Italy as artist for *The Illustrated London News.* His first serious work was the cartoon "Peace" in 1862, directed against those in the North who opposed the prosecution of the Civil War. This and his other car-

toons during the Civil War and Reconstruction days were published in *Harper's Weekly;* they attracted great attention, and Nast was called by President Lincoln "our best recruiting sergeant." Even more able were Nast's cartoons against the Tweed Ring conspiracy in New York city, his caricature of Tweed being the means of the latter's identification and arrest at Vigo. He had been an ardent Republican in his earlier years; but his advocacy of civil service reform and his distrust of Blaine forced him to become a Mugwump and in 1884 an open supporter of the Democratic Party, from which in 1892 he returned to the Republican Party. He had lost practically all of his earnings by the failure of Grant and Ward, and in May, 1902, was appointed consul general at Guayaquil, Ecuador, where he died on Dec. 7, in the same year. He did some painting in oil and some book illustrations, but his fame rests on his caricatures and political cartoons. Nast introduced the donkey to typify the Democratic Party, the elephant to typify the Republican Party, and the tiger to typify Tammany Hall.

See A. B. Paine, *Thomas Nast, his Period and his Pictures* (1904).

NASTURTIUM or **INDIAN CRESS,** *Tropaeolum majus,* a perennial climber, native of Peru, but in cultivation treated as a hardy annual. It climbs by means of the long stalk of the peltate leaf which is sensitive to contact like a tendril. The irregular flowers have five sepals united at the base, the dorsal one produced into a spur; of the five petals the two upper are slightly different and stand rather apart from the lower three; the eight stamens are unequal and the pistil consists of three carpels which form a fleshy fruit. The flowers are sometimes eaten in salads, and the leaves and young green fruits are pickled in vinegar as a substitute for capers.

The dwarf form known as Tom Thumb (*T. m. nanum*), is an excellent bedding or border flower, growing about a foot high. Other fine annual tropaeolums are *T. peltophorum* with long spurred orange flowers and numerous varieties; and *T. minus;* a kind of miniature *T. majus* with yellow, scarlet and crimson varieties.

The genus *Tropaeolum* (family Tropaeolaceae), native to South America and Mexico, includes about 50 species of generally climbing annual and perennial herbs with orange, yellow, rarely purple or blue, irregular flowers; *A. peregrinum* is the well-known canary-bird flower. A fine nasturtium with brilliant scarlet blossoms is *T. speciosum* from Chile; it has tuberous roots, as have also such well-known perennials as *T. polyphyllum* and *T. pentaphyllum.* The *Nasturtium* of botanists is a genus of plants of the family Cruciferae; *N. officinale* is the water-cress.

NATAL, a province of the Union of South Africa, is bounded by the Indian ocean, by the Umtamvuna and Umzimkulu rivers, which divide it from the Griqualand East division of Cape Colony, by the Drakensberg, which separates it from Basutoland, the Orange Free State, and part of the Transvaal, and by the Pongola river, the Lebombo range, and, for a short distance, a line of latitude, which mark it off from the Transvaal, Swaziland and Portuguese East Africa. Natal, in this extended and official sense, includes Zululand and Amatongaland. The northern boundary of Natal proper for part of the way is the Tugela. The sea board from the mouth of the Umtamvuna to the mouth of the Tugela is 166 m., and from the Tugela to the Portuguese border near Ore Point, 210 miles. Its total area is 35,284 sq.m., or 7·47% of the Union, while it carries a little over 20% of the Union's population. The area of Natal proper is 24,857 sq.mi.

Geologically, the country consists of a monoclinal fold affecting Karroo rocks. Along the axis, which runs more or less north and south, these have been eroded and the underlying rocks of the Swaziland system (granite, schists, etc.) have been exposed along a fairly continuous belt, which can be followed from a point, 5 or 6 m. inland from Port Shipstone, through Inchanga, the Valley of a Thousand Hills, and on into Zululand, where their area broadens out. A great part of the country is formed of horizontal, or gently inclined shales and sandstones, among which numerous sills of dolerite are intercalated. Erosion, attacking these beds, has produced a distinctly terraced topography. The hills are often steep-sided and flat-topped.

Conventially, three zones are distinguished: (*a*) the Coast belt below 1,000 ft., which is about 20 m. wide behind Durban, and which narrows southward, and widens considerably when followed northward and into Zululand. (*b*) The Midlands, between 2,000 and 4,000 feet. (*c*) The Highlands from 4,000 ft. to the foot of the Drakensberg. This classification is over simplified, but may serve as a rough indication of the build of the country. The rivers, owing to rejuvenation, have cut deep valleys in their lower courses, with the result that the topography of the coast belt and part of the midlands is very broken. In their middle, and in part of their upper courses, the rivers flow in broad, open valleys. Owing to their high average gradient, and the numerous waterfalls, due to the outcropping of hard beds of sandstone and dolerite, and also to their low winter level, they are all unnavigable, except for stretches of 3 or 4 m. at the mouths of the Umkomaas and Umzimkulu. The dominant topographical feature is the great barrier of the Drakensberg (*q.v.*), which rises to over 10,000 ft., and from which several secondary ranges run out toward the coast. The Lebombo range, in the north runs from north to south, and is caused by the outcrop of resistant lavas. Rivers, such as the Usutu and the Pongola cut across this escarpment in great "poorts."

Climate and Vegetation.—These are described under UNION OF SOUTH AFRICA. Owing to the range of altitude from sea-level to 5,000 or 6,000 ft. at the foot of the Drakensberg, there is a wide range of climate, which is further complicated by the varied topography. Always, however, the sub-tropical coast belt stands out as a distinct natural region, with its humid heat, small temperature ranges and its sub-tropical vegetation and production. Inland, the winter drought becomes more clearly marked and frosts more frequent and severe during the winter nights. The chief rain-bearing wind is from the south-west. A very characteristic feature of the Natal climate is the "hot winds," which are usually most frequent in spring and summer. They appear to be due to the flow of air being drawn toward depressions passing southward along the coast. They blow from the north-west and are heated by compression as they descend the escarpments. The temperature often rises above 90° and the relative humidity may fall to 30. A hot wind may blow for a few hours, or for two or three days. It causes great clouds of dust, and all doors and windows in the houses have to be closed. Usually these winds change suddenly, or are replaced by a cool, moist wind from the south-west, which often brings greatly appreciated rain, or sometimes, in the higher districts, snow.

In addition to the trees, shrubs and grasses, described elsewhere, mention may be made of the flowers, which are often beautiful. Some of these, like the red bush lily, grow in the shade of the patches of bush. Others are more tolerant of light, and are to be found in the open. Among these are the fire lily, which blooms in the early spring before the grasses have grown beyond a few inches, the agapanthus, the arum lily along the streams, the gladioli, etc. A very common grassland flower, and one that blooms late, when the grasses are tall, is the leonotis, which attains a height of 5 or 6 ft., and has terra-cotta to orange-coloured flowers. Many a hillside in early spring is enlivened by the flowers of the aloes, in various shades of red. The delightfully rich crimson of the Kafir boom blossoms is peculiarly characteristic of much of Natal

Fauna.—(*See* also SOUTH AFRICA, UNION OF.) Some of the smaller buck have increased of late years, owing to the cover afforded them by the large wattle plantations. Jackals are undesirably numerous in some of the upland districts, and they often destroy many lambs. Otters occur in some of the rivers. Snakes are common. The chief sporting birds are the quail, partridge and guinea fowl. About 450 sq.m. of country have been set aside as game reserves, in which no animals may be killed at any time. There are several such reserves, one near Giants' Castle, to protect the surviving eland, and one on the Mkusi, in Zululand, where the inyala (buck) still survives, as well as impala, the Zululand suni, etc. Reserves have been established in the Klip River and the Umgeni districts. In addition, several animals and birds have been declared royal game, and cannot be shot

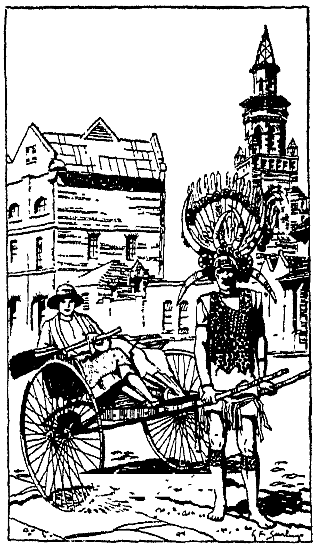
or captured. They include the white, or square-lipped, rhinoceros, which is still found in Zululand, the elephant, female eland, the impala, inyala, roan antelope, springbok, sassaby; crested crane, Stanley crane, etc.

Population.—The total population of Natal in 1936 was 1,946,468. The natives (*see* ZULULAND, CAPE PROVINCE) numbered in 1936 approximately 1,553,629, or nearly 80% of the total population. About half of them live under tribal conditions on locations, which are saturated with population, under 20th-century conditions of skill and methods of exploitation. The other half live on farms owned by Europeans, on crown lands, or in the towns. In 1936 the Asiatics were numbered at 183,661. They were largely concentrated in the coastal belt. Originally imported as indentured labourers for the sugar plantations, many of these Indians have become small market gardeners, or have taken employment in hotels and domestic service or industry, where they supply much of the unskilled and semi-skilled labour. The British elements constitute the majority of the white population of 190,549 (1936). The "northern districts," Utrecht and Vryheid, however, are chiefly inhabited by Afrikaans-speaking people of Dutch origin. In recent years the percentage of Europeans of non-British origin in the total population has probably increased, owing to the considerable numbers employed in the government services. In 1936 the "home language" of the Natal European population was reported as follows: English 141,550, Afrikaans 38,301, English and Afrikaans 3,727, German 4,792, other languages 2,179. The German group is centred about New Hanover. Scandinavian settlers about the Umzimkulu, and in Durban, especially connected with the whaling industry, contribute a very valuable element to the population. There is also an appreciable French element, which originally migrated to Natal, largely from Mauritius, in connection with the sugar industry, though it is no longer confined to that industry. The number of "coloured" people in Natal is quite small, the "mixed and others" in 1936 numbering about 18,629.

Towns.—Apart from Pietermaritzburg, the capital, and Durban (*qq.v.*), the only port and the largest centre, the towns of Natal are quite small. Only two, in addition to the two just mentioned, had a white population of over 2,000, according to the 1936 census: Ladysmith (whites 3,660, total 9,702), which is now a railway centre of some importance; and Vryheid (whites 3,127, total 6,436). Other towns, with 1936 populations, are: Glencoe (whites 1,256, total 3,339), a railway junction, and near the coal fields; Newcastle (whites 1,908, total 4,945). Vryheid and Newcastle are also near coal mines, and Newcastle is developing an iron and steel industry.

Communications.—Railway construction has been greatly handicapped by the varied topography. The main line from Durban to the Transvaal climbs to 1,808 ft. at Krautzkloof (23 mi.), 3,006 ft. at Thornville Junction (61 mi.), drops to 2,218 at Pietermaritzburg (73 mi.), rises to 3,702 at Hilton Road (84 mi.), to 4,807 at Nottingham Road (116 mi.), drops to 3,280 ft. at Colenso (185 mi.), and rises again to 5,429 ft. at Volksrust, just over the Transvaal border, and to 5,520 ft. at Van Reenens, just within the Orange Free State. Electrification of the whole Natal main line from Durban to Volksrust (323 mi.), begun in 1922, was completed in 1937. From the main system a line runs from Durban along the coast southward to Port Shepstone, and northward as far as the Pongola in Zululand to serve the sugar cane area. From Pietermaritzburg a line with two short branches was constructed to Krantzkop through the wattle belt. Another runs southwestward across the grain of the country to open up East Griqualand; from Glencoe Junction a line running through Dundee and Vryheid carries large quantities of coal. There are a few other smaller lines, which can be seen on a map. As in other parts of the world, the railways are feeling the effect of motor competition along some stretches. The journey by road from Pietermaritzburg to Durban is shorter and quicker than by rail.

Agriculture.—The coast belt is sharply marked off from the rest of the country. It produces sugar, bananas, pineapples, citrus fruit, etc. Formerly, practically all the cane grown was of the Uba variety, but extensive research was undertaken with a view to the development of new Mosaic-free varieties superior to Uba. In 1940 there were 340,396 ac. under cane, and the production of sugar for the year 1938–39 was 522,732 short tons. The industry now satisfies the requirements of the South African market, and has a surplus for export. Among the by-products are molasses, used for cattle feeding and also exported, motor spirit produced from the molasses, methylated spirits, ether and wax. Approximately 2,000 ac. in the Kearsney-Stanger area are devoted to tea growing. In 1938–39 the production of green leaf was 3,438,532 lb., of manufactured tea, 814,015 lb. The industry shows little sign of growing. The rest of Natal is devoted to mixed farming, with increasing stress being laid on dairying. Maize thrives particularly well in the midlands, but little of this grain is exported because it is often sold by the white farmers to the natives, whose own food production is insufficient. Between 2,000 and 6,000 ft. above sea level the Australian black wattle is grown, especially in the mist belts along the escarpments. From the bark an extract is made which is used in tanning. The poles supply the mines with pit props, and the towns with much of their domestic fuel. There is a wattle belt, fairly well defined in the midlands of Natal, through the middle of which runs the Richmond-Pietermaritzburg-Greytown-Krantzkop railway. The wattle plantations cover 365,000 ac., and in 1939 the quantity of bark exported from the country was over 90,000 tons, Great Britain, Belgium, Germany and Japan being the chief customers. Wattle extract is also exported. Cotton growing appears to have passed the experimental stage. It is being grown in some of the northern and eastern districts of Natal and in Zululand. In 1938–39, 533,588 lb. unginned cotton seed were grown. The growing of tobacco was stimulated by the introduction of a preferential tariff for empire tobacco in Great Britain in 1925.



BY COURTESY OF E. G. MORSE
'RICKSHA "BOY" OF DURBAN, NATAL

The chief mineral produced in the country is coal. The chief coal field is in the Klip river and Newcastle districts, centring about Dundee. Mines are also active in the Vryheid and Utrecht districts. The expense of the long railway journey to the coast, on the average about 240 mi., is partially counterbalanced by the nearness of the coal to the surface. In 1940 the output was over 4,000,000 short tons. At Waschbank the following by-products are being produced: tar, sulphate of ammonia, light creosote oil and naphtha. Tar is also being made.

Education.—For higher education *see* SOUTH AFRICA, UNION OF. The direction of public education, other than higher education, rests with the Provincial Education department, subject to the control of the provincial administration. At its head is the superintendent of education. The department has direct management of primary and of some secondary schools, and makes grants to various private schools, which maintain the same standard as the government schools. Fees are charged for pupils in the secondary schools. Special schools are provided for native, coloured and Indian children. Attendance is compulsory for European children between 7 and 15 who live within three miles of a school. A government training college for teachers is situated in Pietermaritzburg in conjunction with Natal University college. There are in Natal five training colleges for natives, Sastri college and four training classes for Indians, and one training centre for coloured teachers. In addition to the government schools, there are several good schools in the province, both for boys and girls, which are modelled on the English public school. An agricultural college, connected with a government experimental farm, was opened in 1906 at Cedara, 14 mi. from Pietermaritzburg. To

meet some of the requirements of the non-European population, there were, in 1939, 739 public primary and 55 secondary schools for natives, and 141 primary and 5 secondary for other non-Europeans (chiefly Asiatics). There were 86,345 native pupils, and 29,097 other non-Europeans in the primary, secondary and industrial schools of Natal in 1939. (*See* also SOUTH AFRICA, UNION OF.) (R. U. S.)

HISTORY

Vasco da Gama on his voyage to India sighted the bluff at the entrance to the bay now forming the harbour of Durban on Christmas day 1497 and named the country Terra Natalis. Da Gama made no landing there and, like the rest of South Africa, Natal was neglected by the Portuguese, whose nearest settlement was at Delagoa bay. The first detailed accounts of the country were received from mariners. In 1684 an English ship put into Port Natal (as the bay came to be known) and purchased ivory from the natives, who, however, refused to deal in slaves. In May 1685 another English ship the "Good Hope" was wrecked in crossing the bar at Port Natal and in Feb. 1686 the "Stavenisse," a Dutch East Indiaman, was wrecked a little farther south. Survivors of both vessels lived for nearly a year at Port Natal and there built a boat in which they made the voyage to Capetown in 12 days. They brought with them three tons of ivory. This fact, and their reports of the immense herds of elephants which roamed the bush, led Simon van der Stell, then governor at Capetown to dispatch (1689) the ship "Noord" to Port Natal, with instructions to her commander to open up a trade in ivory and to acquire possession of the bay. The bay was "purchased" from the chief of the Amatuli tribe, for about £50 worth of goods. No settlement was then made, and in 1705 the son of the chief repudiated the bargain. In 1721 the Cape government did form a settlement at the bay, but it was soon afterward abandoned. Thereafter for nearly 100 years Natal was again neglected by white men.

From the records of the 17th and 18th centuries it is apparent that the people then inhabiting Natal were Bantu Negroes of the Kafir (Ama Xosa) branch. The most numerous and most powerful tribe appeared to be the Abambo, while the Amatuli occupied a considerable part of the coastland. These Kafirs seem to have been more given to agriculture and more peaceful than their neighbours in Kaffraria and Cape Colony. But the quiet of the country was destroyed by the inroads of Chaka, the chief of the Zulus (*see* ZULULAND). Chaka between 1818 and 1820 ravaged the whole of what is now known as Natal, and after beating his foes in battle, butchered the women, children and old men, incorporating the young men in his impis. The population was greatly reduced and large areas left without a single inhabitant. By right of conquest Chaka became undisputed master of the country.

First British Settlement.—Such was the situation when the first British settlement was made in Natal, Cape Colony having passed meanwhile from Dutch to British possession. In 1823 Francis George Farewell, formerly a lieutenant in the British navy, with other merchants of Capetown, formed a company to trade with the natives of the southeast coast. In the brig "Salisbury," commanded by James S. King, who had been a midshipman in the navy, Farewell visited Port Natal, St. Lucia and Delagoa bays. He was so impressed with the possibilities of Natal both for trade and colonization that he resolved to establish himself at the port. He went there with ten companions, among them Henry Francis Fynn. All the rest save Farewell and Fynn speedily repented of their adventure and returned to the Cape, but the two who remained were joined by three sailors, John Cane, Henry Ogle and Thomas Holstead, a lad. Farewell, Fynn and others went to the royal kraal of Chaka and, having cured him of a wound and made him various presents, obtained a document, dated Aug. 7, 1824, ceding to "F. G. Farewell and company entire and full possession in perpetuity" of a tract of land including "the port or harbour of Natal." On the 27th of the same month Farewell hoisted the Union Jack at the port and declared the territory he had acquired a British possession. In 1825 he was joined by King, who had meantime visited England and had obtained from the government a letter of recommendation to Lord Charles Somerset, governor of the Cape, granting King permission to settle at Natal. Farewell, King and Fynn made independent settlements at various parts of the bay, where a few Amatuli still lingered. They lived, practically, as Kafir chiefs, trading with Chaka and gathering round them many refugees from that monarch's tyranny. Early in 1828 King, accompanied by two of Chaka's indunas, voyaged in the "Elizabeth and Susan," a small schooner built by the settlers, to Port Elizabeth. He appears to have been coldly received by the authorities. Soon after his return to Natal, King died, and in the same month (Sept. 1828) Chaka was murdered by his brother Dingaan. In Dec. 1828 Farewell went in the "Elizabeth and Susan" to Port Elizabeth. On this occasion the authorities confiscated the schooner on the ground that it was unregistered and that it came from a foreign port. Farewell was not daunted, and in Sept. 1829 set out to return overland to Port Natal. He was, however, murdered in Pondoland by a chief who was at enmity with the Zulus. Fynn thus became leader of the whites at the port, Dingaan declaring him to be his representative and "great chief of the Natal Kafirs." In 1834, however, Fynn accepted a post under the Cape government and did not return to Natal for many years. It was in this year that a petition from Capetown merchants asking for the creation of a British colony at Natal was met by the statement that the Cape finances would not permit the establishment of a new dependency.

The next step was taken by the settlers at the port, who in 1835 resolved to lay out a town, which they named Durban, after Sir Benjamin d'Urban, then governor of Cape Colony. The settlers, who numbered about 50, sent a memorial to the governor calling attention to the fact that they were acknowledged rulers over a large tract of territory south of the Tugela, and asking that this territory should be proclaimed a British colony under the name of Victoria and that a governor and council be appointed. To all these requests no official answer was returned. The settlers had been joined in the year named (1835) by Captain A. F. Gardiner, a naval officer, whose chief object was the evangelization of the natives. With the support of the traders he founded a mission station in the hills (which he named Berea) overlooking the bay. In 1837 Gardiner was given authority by the British government to exercise jurisdiction over the traders. They, however, refused to acknowledge Gardiner's authority, and from the Cape government he received no support.[1] It was not until their hand was forced by the occupation of the interior by Boer farmers that the Cape authorities at length intervened.

The Dutch and Dingaan.—The British settlers had, characteristically, reached Natal mainly by way of the sea; the new tide of immigration was by land—the *voortrekkers* streamed through the passes of the Drakenberg, bringing with them their wives and children and vast herds of cattle. The reasons which caused the exodus from the Cape are discussed elsewhere (*see* SOUTH AFRICA, UNION OF and CAPE PROVINCE); here it is only necessary to point out that those emigrants who entered Natal shared with those who settled elsewhere an intense desire to be free from British control. The first emigrant Boers to enter the country were led by Pieter Retief (*c.* 1780–1838), a man of Huguenot descent and of marked ability, who had suffered severely in the Kafir wars. Passing through the almost deserted upper regions, Retief arrived at the bay in Oct. 1837. He went from there to Dingaan's kraal with the object of securing a formal cession of territory to the Dutch farmers. Dingaan consented on condition that the Boers recover for him certain cattle stolen by another chief; this task Retief accomplished, and with the help of the Rev. F. Owen, an Anglican missionary then living at Dingaan's kraal, a deed of cession was drawn up in English and signed by Dingaan and Retief on Feb. 4, 1838. Two days after the signature of the deed Retief and all of his party, 66 whites,

[1]Captain Allen Francis Gardiner (1794–1851) left Natal in 1838, subsequently devoting himself to missionary work in South America, being known as the missionary to Patagonia. He died of starvation in Tierra del Fuego.

besides Hottentot servants, were treacherously murdered by Dingaan's orders. The Zulu king then commanded his impis to kill all the Boers who had entered Natal. The Zulu forces crossed the Tugela the same day, and the most advanced parties of the Boers were massacred, many at a spot near where the town of Weenen now stands, its name (meaning wailing or weeping) commemorating the event. In one week after the murder of Retief 600 Boers—men, women and children—had been killed by the Zulus. The English settlers at the bay, with a following of some 700 natives, made an attempt to aid the Boers, but in a fight on April 7 they were overwhelmed, and only four Europeans escaped to the bay.

After the Zulus retired, fewer than a dozen Englishmen returned to live at the port; the missionaries, hunters and other traders went back to the Cape. Meanwhile the Boers, who had repelled the Zulu attacks on their laagers, had been joined by others from the Drakenberg, and about 400 men under Hendrik Potgieter and Piet Uys advanced to attack Dingaan. On April 11, however, they fell into a trap and with difficulty cut their way out. Among those slain were Piet Uys and his son Dirk, aged 15, who rode by his side. Toward the end of the year the Boers received reinforcements, and in December 460 men set out under Andries Pretorius to avenge themselves on the Zulus. On Sunday Dec. 16, 1838, while laagered near the Umslatos river, they were attacked by over 10,000 Zulus. The Boers had firearms, the Zulus their assegais only, and after a three hours' fight the Zulus were totally defeated, losing thousands killed, while the farmers' casualties were under a dozen. (This memorable victory is annually commemorated by Afrikaners as Dingaan's day. while the Umslatos, which ran red with the blood of the slain, was renamed Blood river.) Dingaan fled, the victorious Boers entered the royal kraal, gave decent burial to the skeletons of Retief and his party, and regarded themselves as now undisputed masters of Natal.

Returning south, Pretorius and his commando were surprised to learn that Port Natal had been occupied on Dec. 4 by a detachment of the 72nd Highlanders In sanctioning the occupation of the port the British government of the day had no intention of making Natal a British colony, but wished to prevent the Boers establishing an independent republic upon the coast. After remaining at the port just over a year the Highlanders were withdrawn, on Christmas Eve 1839. Meanwhile the Boers had founded Pietermaritzburg and made it the seat of their volksraad. They rendered their power in Natal absolute, for the time, in the following month, when they joined with Panda, Dingaan's brother, in another attack on the Zulu king. Dingaan was utterly defeated and soon afterward perished, Panda becoming king in his stead by favour of the Boers.

This Boer community was not able to establish an enduring state. But their impatience of control, reflected in the form of government adopted, led to disastrous consequences. Legislative power was vested, nominally, in the volksraad (consisting of 24 members), while the president and executive were changed every three months. But whenever any measure of importance was to be decided a meeting was called of *het publiek,* that is, of all who chose to attend, to sanction or reject it—a procedure which led to confusion and indecision. While such was the domestic state of affairs the settlers cherished large territorial views. They had declared themselves an independent state under the title of "the republic of Port Natal and adjacent countries" (commonly called the republic of Natalia or Natal), and sought (Sept. 1840) from Sir George Napier at the Cape an acknowledgment of their independence by Great Britain. Sir George, being without definite instructions from England, could at first give no decisive answer. Having at length received an intimation from London that the queen "could not acknowledge the independence of her own subjects, but that the trade of the emigrant farmers would be placed on the same footing as that of any other British settlement, upon their receiving a military force to exclude the interference with or possession of the country by any other European power," Sir George communicated this decision to the volksraad in Sept. 1841. The Boers, who strongly resented the contention of the British that they could not shake off British nationality though beyond the bounds of any recognized British possession, after very brief consideration firmly rejected Napier's overtures.

An incident which happened at this time greatly encouraged the Boers to persist in their opposition. In March 1842 a Dutch vessel sent out by G. G. Ohrig, an Amsterdam merchant who sympathized warmly with the cause of the emigrant farmers, reached Port Natal, and its supercargo, J. A. Smellekamp (a man who subsequently played a part in the early history of the Transvaal and Orange Free State), without any authority, concluded a treaty with the volksraad assuring them of the protection of Holland. The Natal Boers were firmly persuaded that Holland would aid them in resisting Great Britain.

Dick King's Ride.—On May 4, 1842, Capt. T. C. Smith with a force of 263 men who, at Sir George Napier's orders had marched overland from Cape Colony, reached Durban without opposition, and encamped at the base of the Berea hills. The Boers, cut off from their port, called out a commando of some 300 to 400 men under Andries Pretorius and gathered at Congella at the head of the bay. After repulsing an attack on their camp the Boers captured the harbour and settlement, and on May 31 blockaded the British camp. Meanwhile an old Durban resident, Richard (commonly called Dick) King, had undertaken to convey tidings of the perilous position of the British force to the commandant at Graham's Town. He started on the night of the 25th and, escaping the Boer outposts, rode through the dense bush and across the bridgeless rivers of Kaffraria at peril of his life from hostile natives and wild beasts, and in nine days reached his destination—a distance of nearly 600 mi. by the route to be followed. This remarkable ride was accomplished with one change of mount, obtained from a missionary in Pondoland. A comparatively strong force under Col. A. J. Cloete was at once sent by sea to Port Natal, and on June 26 Capt. Smith was relieved. Within a fortnight Col. Cloete had received the submission of the volksraad at Pietermaritzburg. The burghers represented that they were under the protection of Holland, but this plea was peremptorily rejected by the commander of the British forces.

The British government of the day, the second Peel administration, held that the establishment of a colony in Natal would be attended with little prospect of advantage, but in deference to the strongly urged views of Sir George Napier, Lord Stanley (secretary of state for the colonies), in a dispatch of Dec. 13, received in Capetown on April 23, 1843, consented to its annexation. The institutions adopted were to be as far as possible in accordance with the wishes of the people, but it was a fundamental condition "that there should not be in the eye of the law any distinction or disqualification whatever, founded on mere difference of colour, origin, language or creed"—a condition not kept in later years. Sir George then appointed Henry Cloete (a brother of Col. Cloete) as special commissioner to explain to the Natal volksraad the decision of the government. Cloete, whose task was one of great difficulty and delicacy, behaved with the utmost tact, and on Aug. 8, 1843, the Natal volksraad unanimously agreed to the terms proposed by Lord Stanley. Many of the Boers who would not acknowledge British rule trekked once more over the mountains into what are now the Orange Free State and Transvaal provinces At the end of 1843 there were not more than 500 Boer families left in Natal.

A British Colony.—Although proclaimed a British colony in 1843, and in 1844 declared a part of Cape Colony, it was not until the end of 1845 that an effective administration was installed, with Martin West as lieutenant-governor, and the power of the volksraad finally came to an end.

The new administration found it hard to please the Boer farmers, who among other grievances resented what they considered the undue favour shown to the natives, whose numbers had been greatly augmented by the flight of refugees from Panda. The natives were settled in 1846 in "locations" and placed under the general supervision of Sir Theophilus Shepstone (*q.v.*). Sir Harry Smith, newly appointed governor of the Cape, met, on the banks of the upper Tugela, a body of farmers preparing to

recross the Drakensberg—which had been fixed as the northern frontier—and by remedying their grievances induced many of them to remain in Natal. By the migration of the others the whites were again considerably reduced, but the Boers who remained were contented and loyal, and through the arrival of 4,500 emigrants from England in the years 1848–1851 and by subsequent immigration from overseas the colony became overwhelmingly British in character.

From these years dates the development of trade and agriculture in the colony, followed somewhat later by the exploitation of the mineral resources of the country. At the same time schools were established and various churches began or increased their work in the colony. Dr. Colenso, appointed bishop of Natal, arrived in 1854. In 1856 the dependence of the country on Cape Colony was put to an end and Natal was constituted a distinct colony with a legislative council of 16 members, 12 elected by the inhabitants and 4 nominated by the crown. At the time the white population exceeded 8,000. While dependent on the Cape, ordinances had been passed establishing Roman-Dutch law as the law of Natal and, save where modified by legislation, it remained in force.

Indian Coolies Introduced.—The British settlers soon realized that the coastlands were suited to the cultivation of tropical or semitropical products, and from 1852 onward sugar, coffee, cotton and arrowroot were introduced, tea being afterward substituted for coffee. The sugar industry soon became of importance, and the planters were compelled to seek for large numbers of labourers. The natives, at ease in their locations, did not volunteer in sufficient numbers, and recourse was had to coolie labour from India. The first coolies reached Natal in 1860. They came under indentures, but at the expiration of their contract were allowed to settle in the colony. Up to 1869 some 5,000 Indians had come to Natal. Immigration then ceased but was resumed in 1874. This bringing in of Indians proved one of the most momentous steps taken in the history of South Africa, for the Indian population rapidly increased, the "free" Indians becoming market gardeners, farmers, hawkers, traders, and in time serious competitors of the whites. But in 1860 and for many years afterward these consequences were not foreseen, and alone among the South African states Natal offered a welcome to Asiatics.

In 1867 R. W. Keate (1814–73) became lieutenant-governor, a post which he filled until 1872. His administration was notable because he twice acted as arbitrator in disputes in which the Boer states were involved. In a dispute between the Transvaal and the Orange Free State he decided (Feb. 1870) that the Klip river and not the upper Vaal was the frontier stream. A more famous decision, that known as the Keate award, was given in Oct. 1871. It concerned the southwestern frontiers of the Transvaal, and the award, which was against the Transvaal pretensions, had important effects on the history of South Africa (*see* GRIQUALAND EAST AND GRIQUALAND WEST; TRANSVAAL).

During all this time little was done to alter the condition of the natives. There was scarcely an attempt to copy the policy, then followed in Cape Colony, of encouraging the education and civilization of the black man. Neither was Natal faced with the Cape problem of a large half-caste population. While the opportunity of educating and training a docile people was in the main neglected, savage abuse of power by their chiefs was prevented. Under the superintendence of Shepstone the original refugees were quiet and contented. This ideal lot, from the native point of view, drew such numbers of immigrants from disturbed districts that, with the natural increase of population, in 30 years the native inhabitants increased from about 100,000 to fully 350,000. The first serious collision between the natives and the government occurred in 1873. The Amahlubi, one of the highest in rank of the Bantu tribes of South Africa, fleeing from the cruelties of Panda, had been located by the Natal government under their chief Langalibalele (*i.e.*, the great sun which shines and burns) in 1848 at the foot of the Drakensberg with the object of preventing the Bushmen who dwelt in the mountains from plundering the upland farmers. There the Amahlubi prospered, and after the diamond fields had been discovered many of the young men who had been to Kimberley brought back firearms. These Langalibalele refused to register, and entered into negotiations with several tribes with the object of organizing a general revolt. Prompt action by Sir Benjamin Pine, the lieutenant-governor of the colony, together with help from the Cape and Basutoland, prevented the success of Langalibalele's plan, and his own tribe, numbering some 10,000 persons, was the only one which rebelled. The chief was captured, and exiled to Cape Colony (Aug. 1874). Permitted to return to Natal in 1886, he died in 1889.

The Colenso Affair.—Meantime the colony had weathered a severe commercial crisis brought on in 1865 through over-speculation and the neglect of agriculture, save along the coast belt. But the trade over the mountains largely developed on the discovery of the Kimberley diamond mines, and the progress of the country was greatly promoted by the substitution of the railway for the ox wagon as a means of transport. On Jan. 1, 1876, Sir Henry Bulwer, who had succeeded Wolseley as governor, turned the first sod of a new state-owned railway which was completed as far as Maritzburg in 1880. At this date the white inhabitants numbered about 20,000. But besides a commercial crisis, the colony had been the scene of an ecclesiastical dispute which attracted widespread attention. Bishop Colenso (*q.v.*), condemned in 1863 on a charge of heresy, ignored the authority of the court of South African bishops and was maintained in his position by decision of the privy council in England. This led to a division among the Anglican community in the colony and the consecration in 1869 of a rival bishop, who took the title of bishop of Maritzburg. (Reunion of the Anglican body in Natal was effected in 1910.) Colenso's bold advocacy of the cause of the natives attracted almost equal attention. His native name was Usobantu (*father of the people*).

For some years Natal, in common with the other countries of South Africa, had been influenced by disturbed conditions in the Transvaal. The annexation of the Transvaal to Great Britain, effected by Sir Theophilus Shepstone in April 1877, would, it was hoped, put a period to the disorders in that country. But the new administration at Pretoria inherited many disputes with the Zulus, disputes which were in large measure the cause of the war of 1879. For years the Zulus had lived in amity with the Natalians, from whom they received substantial favours, and in 1872 Cetywayo (*q.v.*), on succeeding his father Panda, had given assurances of good behaviour. These promises were not kept for long, and by 1878 his attitude had become so hostile toward both the Natal and Transvaal governments that Sir Bartle Frere, then high commissioner for South Africa, determined on his reduction. During the war (*see* ZULULAND) Natal was used as the British base, and the Natal volunteers rendered valuable service in the campaign which, after opening with disasters to the British forces, ended in the breaking of the Zulu power.

Majuba.—Scarcely had the colony recovered from the shock of the Zulu War than it was involved in the uprising of the Transvaal Boers (1880–81). The Natalians were intensely British in sentiment, and resented deeply the policy adopted by the Gladstone administration. At Ingogo, Majuba and Laing's Nek, all of them situated within the colony, British forces had been defeated by the Boers; and the treaty of retrocession was regarded in Natal as an unworthy surrender of British rights. The Natalians nevertheless made up their minds to shape their policy in conformity with that settlement. It was not long before their patience was once more severely taxed. Transvaal Boers, taking advantage of the disputes among the petty Zulu chiefs set up by Sir Garnet Wolseley after the war of 1878–79, intervened (in 1883), and as a reward for the assistance they had rendered to one of the combatants, demanded and annexed 8,000 sq.mi. of country, which they styled the "New Republic." This interference by the Transvaal in Zululand affairs gave great offense in Natal. The "New Republic," reduced in area, however, to fewer than 2,000 sq.mi., was nevertheless recognized by the British government in 1886, and in 1888 its consent was given to the territory (the Vryheid district) being incorporated with the Transvaal. Meanwhile, in 1887, the remainder of Zululand had been annexed to Great Britain (*see* ZULULAND).

Effect of Discovery of Gold.—In 1884 the discovery of gold in De Kaap valley, and on Moodie's farm in the Transvaal, caused a considerable rush of colonists from Natal to that country. Natal not only sent its own colonists to the new fields, but also offered the nearest route for prospectors from Cape Colony or from Europe. Two years later the Rand gold fields were proclaimed, and the tide of trade which had already set in with the Transvaal steadily increased. In that year (1886) the railway reached Ladysmith, and in 1891 it was completed to the Transvaal frontier at Charlestown, the section from Ladysmith northward opening up the Dundee and Newcastle coal fields. Thus a new industry was added to the resources of the colony.

The demand which the growing trade made upon the one port of Natal, Durban, encouraged the colonists to redouble their efforts to improve their harbour.

Harbour works had been begun in 1857, but it was chiefly due to the energy of one of Natal's most distinguished sons, Harry Escombe, that Durban was transformed into a modern port. From 1881 to 1893 Escombe was chairman of the harbour board.

Self-Government.—For many years there had been an agitation among the colonists for self-government. In 1882 the colony was offered self-government coupled with the obligations of self-defense. The offer was declined, but in 1883 the legislative council was remodelled so as to consist of 23 elected and 7 nominated members. In 1890 the elections to the council led to the return of a majority in favour of accepting self-government, and in 1893 a bill in favour of the proposed change was passed and received the sanction of the imperial government. At the time the white inhabitants numbered about 50,000. The electoral law was framed to prevent more than a very few Indians and natives obtaining the franchise. Sir John Robinson (1839–1903), who had gone to Natal in 1850, was a leading journalist in the colony and had been a member of the legislative council after 1863, became the first premier and colonial secretary, with Harry Escombe as attorney-general. The year that witnessed this change in the constitution was also notable for the death of Sir Theophilus Shepstone, Natal's most prominent citizen. Sir John Robinson remained premier until 1897, a year marked by the annexation of Zululand to Natal. In the following year Natal entered the customs union already existing between Cape Colony and the Orange Free State.

The Anglo-Boer War.—Natal watched with anxiety the increasing tension between the Transvaal and Cape Colony, and its citizens suffered, equally with other *Uitlanders,* the disabilities imposed by the Pretoria government. As early as May 1899 the Natal ministry officially intimated its belief that the Transvaal would go to war and, while promising every support possible to the imperial government, expressed anxiety for the defense of the frontier. On Oct. 11, 1899, war broke out, and Natal was invaded by the Boers. The story of the war is told elsewhere (*see* SOUTH AFRICAN WAR; SOUTH AFRICA, UNION OF). A small number of the Boer colonists joined the enemy but there was no general rebellion among them, and the promise that Natal would assist the imperial government was amply redeemed.

One result of the war was an addition to the territory of Natal of a small part of the Transvaal, namely the district of Vryheid, the district of Utrecht, and a portion of the district of Wakkerstroom. As to Vryheid, "in handing over this district to the administration which controls the rest of Zululand, his majesty's government," wrote Joseph Chamberlain (then secretary of state for the colonies), under date March 1902, "feel that they are reuniting what ought never to have been separated." A claim by Natal to annex portions of the Harrismith and Vrede districts of the Free State was, however, disallowed. The districts which were added to Natal contained about 6,000 white inhabitants (mostly Dutch), and some 92,000 natives, and had an area of nearly 7,000 sq.mi., so that this annexation meant an addition to the white population of Natal of about one-tenth, to its native population of about one-tenth also, and to its territory of about one-fourth. The territories were formally transferred to Natal in Jan. 1903.

Native Affairs: The 1906 Revolt.—The period following the war was succeeded by commercial depression. The government met the crisis by renewed energy in harbour works, railway constructions, and the development of the natural resources of the country. A railway to the Zululand coal fields was completed in 1903, and in the same year a line was opened to Vryheid in the newly annexed territories. In Aug. 1903 Sir Alfred Hime, who had been premier after June 1899, resigned and was succeeded by George Sutton, the founder of the wattle industry in Natal and one of the pioneers in the coal-mining industry. In May 1905, the Sutton cabinet was replaced by a coalition ministry under C. J. Smythe, while in 1906 Sir F. R. Moor became premier. These changes of ministry reflected, chiefly, differences concerning the treatment of commercial questions and the policy to be adopted toward the natives. Toward those Boer colonists who had joined the enemy during the war leniency was shown, all rebels being pardoned. The attitude of the natives both in Natal proper and in Zululand caused much disquiet. The chief concern of the Natal government was to remodel its native policy where it proved inadequate. During 1903–04 a Native Affairs' commission, representative of all the South African states, had obtained much evidence on the status and conditions of the natives. Among its recommendations was the direct political representation of natives in the colonial legislatures on the New Zealand model, and the imposition of direct taxation upon natives. Carrying out this last recommendation Natal passed in 1905 an act imposing a poll tax of £1 on all males over 18 in the colony, except indentured Indians and natives paying hut tax (which was 14s. a year). Every European was bound to pay the tax. In 1906 a serious rebellion broke out in the colony, attributable ostensibly to the poll tax, and spread to Zululand. An incident which marked the beginning of this rebellion brought the Natal ministry into sharp conflict with the imperial government (the Campbell-Bannerman administration). Twelve natives were to be shot by order of a court martial for killing, at Byrnetown, two Europeans, who had been sent to enforce the collection of the poll tax. On the day before that fixed for the execution Lord Elgin, then secretary of state for the colonies, intervened and directed the governor to postpone the execution of the sentence Thereupon the Natal ministry resigned, giving as its reason the importance of maintaining the authority of the colonial administration at a critical period and the constitutional question involved in the interference by the imperial authorities in the domestic affairs of a self-governing colony. After a day's delay, during which the governor of Natal, Sir Henry McCallum, reiterated his concurrence, already made known in London, in the justice of the sentence passed on the natives, Lord Elgin gave way (March 30). The Natal ministry thereupon remained in office. The guilty natives were shot on April 2. It was at this time that Bambaata, a chief in the Greytown district who had been deposed for misconduct, kidnapped the regent appointed in his stead. He was pursued and escaped to Zululand, where he received considerable help. He was killed in battle in June, and by the close of July 1906 the rebellion was at an end. As has been stated, it was ostensibly attributable to the poll tax, but the causes were more deep-seated. Though somewhat obscure they could be found in the growing sense of power and solidarity among all the Bantu tribes of South Africa. There were, moreover, special local causes, such as undoubted defects in the Natal administration. (*See* governor's dispatch, June 21, 1906, printed in the Blue Book, Cd. 3247). Many Natalians regarded Dinizulu, the son of Cetewayo, as the inciter of the rebellion and, after a series of murders of whites in Zululand in 1907 and evidences of continued unrest among the natives, the Natal government itself became convinced that Dinizulu was implicated in a rebellious movement. A force under Sir Duncan McKenzie (who had suppressed the 1906 revolt) entered Zululand. Thereupon Dinizulu surrendered (Dec. 1907) without opposition, and was removed to Maritzburg. He was in 1909 found guilty only on the minor charge of harbouring rebels.

The intercolonial commission had dealt with the native question as it affected South Africa as a whole; it was felt that a more local investigation was needed, and in Aug. 1906 a strong commission was appointed to inquire into the condition of the

Natal natives. The commission, whose report was published in Aug. 1907, declared that the chasm between the native and white races had been broadening for years and that the efforts of the administration to reconcile the Bantus to the changed conditions and to convert them into an element of strength had been ineffective. Among other proposals for a more liberal and sympathetic native policy the commission urged the creation of a native advisory board entrusted with very wide powers. "Personal rule," they declared, "supplies the keynote of successful native control"—a statement amply borne out by the influence over the natives exercised by Sir T. Shepstone. The unrest in Zululand delayed action being taken on the commission's report. But in 1909 an act was passed which placed native affairs in the hands of four district commissioners, gave to the minister for native affairs direct executive authority, and created an advisory council for native affairs on which nonofficial members had seats.

Concurrently with the efforts to reorganize its native policy the colony also endeavoured to deal with the Asiatic question. The rapid growth of the Indian population from about 1890 caused much disquiet among the majority of the white inhabitants, who viewed with especial anxiety the activities of the "free," *i.e.*, unindentured, Indians. Several acts had already been passed imposing restrictions upon Indians, and in 1908 a strong commission was appointed to inquire into the whole subject. This commission reported in 1909, its general conclusion being that in the interests of Natal the importation of indentured Indian labour should not be discontinued. For sugar, tea and wattle growing, farming, coal-mining and other industries, indentured Indian labour appeared to be essential. Nothing further was done in Natal up to the establishment of the Union of South Africa, when all questions specially or differentially affecting Asiatics were withdrawn from the competence of the provincial authorities.

Union and After.—Not long after the conclusion of the war of 1899–1902 the close commercial relations between the Transvaal and Natal led to suggestions for a union of the two colonies, but these suggestions were not seriously entertained. The federation or union of all the colonies was a different and more reasonable measure; and this matter was formally reopened by the Cape ministry in 1906. The movement for union rapidly gained strength, and a national convention to consider the matter met in Durban in Oct. 1908. In Natal, especially among the older colonists, who feared that in a united South Africa Natal interests would be overborne, the proposals for union were met with suspicion and opposition, and the Natal ministry felt bound to submit the question to the people. A referendum act was passed in April 1909, and in June 1910 the electors by 11,121 votes to 3,701 decided to join the Union. (*See* South Africa, Union of.) Meanwhile it was agreed by the Cape, Transvaal and Natal governments that, subject to Natal entering the Union, its share of the Rand import trade should be 25% before and 30% after the establishment of the Union. Previously Natal had only 22½% of the traffic, and this agreement led to a revival in trade. The closing months of Natal's existence as a separate colony thus found it peaceful and prosperous. On the establishment of the Union on May 31, 1910, Natal entered it as an original province, Sir F. R. Moor, the premier, becoming a member of the first Union cabinet. The change from the status of a self-governing colony to a province of the Union affected Natal politically more closely than any other province, since in it alone were the great majority of the white inhabitants of British descent. The firm attachment of Natalians to the British connection continued an unchanging factor in the South African situation. Provincial administration was, however, largely carried on upon non-party lines. An exception occurred in 1927 when not a single candidate opposed to the inclusion of the Union Jack in the national flag of the Union was returned to the provincial council. About 70% of the total expenditure of the council is on education. Sir George Plowman, who had filled the office of administrator with great ability after 1918, was succeeded as administrator in 1928 by H. Gordon Watson.

The Indian Problem.—Of the 219,691 Asiatics in the Union in 1936, no fewer than 183,661 lived in Natal. Besides labourers, there were many Indians engaged in professions and commerce. White South Africans in general opposed the further increase of Asiatics in the Union; while, in 1911, the Indian government, long dissatisfied with the attitude of Natal to Indians, prohibited the recruitment of indentured coolies. The Indians both in Natal and the Transvaal complained of many grievances, and their cause was championed by M. K. Gandhi, then resident in South Africa. Arising out of the agitation, riots and disturbances occurred in Natal in 1913. In 1914 the Union government passed legislation intended to prevent Indian immigration into South Africa and to prevent Asiatics already in the Union leaving the province in which they lived. The Smuts-Gandhi agreement of that year was designed to guard the vested interests of Indians already in the Union. The attitude of the white inhabitants of Natal was shown by the borough ordinance passed by the provincial council in Jan. 1924, debarring Indians in future from acquiring the municipal franchise. This ordinance was held up by the Union government for consideration, but in Dec. 1924 assent to its operation was given. The parliamentary franchise was, with few exceptions, already confined to whites. In 1925 there were 38,547 parliamentary electors, of whom only 24 were Indian. In 1927 an agreement on the Indian question was reached by the Union government and the government of India, which led to an amelioration of the condition of Indians in Natal. In accordance with this agreement, the government of India appointed an agent-general in the Union in order to secure effective co-operation between the two governments on this problem. The rank of this official was raised to that of high commissioner on Jan. 1, 1941. During World War II the Indian problem in Natal again became acute. The passage of the so-called "Pegging act" in 1943, intended to deal with the question of Indian penetration of formerly European areas, especially in Durban, was the occasion for the reopening of controversy on this issue.

Ingram, *Natalia, a Condensed History of . . . Natal and Zululand* (1897); R. Russell, *The Garden Colony. The Story of Natal and its Neighbours* (1910 ed.); Eric A. Walker, *A History of South Africa* (London, 1928), with bibliography, including Blue Books. (F. R. C.; Ho. F.)

NATAL, a city and port of Brazil and capital of the state of Rio Grande do Norte, on the right bank of the Rio Potengí, or Rio Grande do Norte, about 2 mi. above its mouth. The population in 1950 was 97,736. Natal is the starting-point of the railway which extends on down the coast to Pernambuco and Maceió, and is a port of call for coastwise steamers, which usually anchor outside the bar. The harbour has been improved and the Brazilian government uses the port as a naval depot. A large airport for transatlantic planes lies a short distance from the city. The only industry of note is the manufacture of cotton, but the exports (chiefly sugar and cotton) are large. Natal was founded in 1597 as a military post to check an illicit trade in Brazil wood. It became the capital of a province in 1820.

NATCHEZ, a noted tribe of lower Mississippi river, near the present city of Natchez, Miss., who, after massacring the French in their territory in 1729, were defeated by them, the remnants taking refuge with the Chickasaw, and later with the Creek and Cherokee. Allied in general culture to the Muskogian tribes (*q.v.*), they had developed a sun worship with a perpetual fire in a temple, and a caste division into "suns," nobles, honoured men and commoners or "stinkards." This system was matrilineal and exogamic, "suns" marrying "stinkard" wives and having honoured children, whereas "sun" women married "stinkard" husbands and had "sun" children. The head "sun" had power of life and death over all others, and was followed in death by his spouses, attendants and voluntary victims. The origin of these anomalous customs is not clear. *See* J. R. Swanton, *Bur. Am. Ethn. Bull.* 43 (1911).

NATCHEZ, a city of Mississippi, U.S.A., on the Mississippi river, near the southern boundary of the state; county seat of

Adams county. It is on federal highways 61, 65 and 84 and is served by the Illinois Central, the Mississippi Central and the Missouri Pacific railways. A $4,000,000 Mississippi river bridge connects Natchez with Vidalia, La. The population in 1950 was 22,740; and 15,296 in 1940 by federal census. The city, centre of romantic life during steamboat days, is on bluffs more than 200 ft. high above the river. There are three small parks overlooking the river; in the heart of the city is the Confederate Memorial park. Duncan park, city-owned park, contains 200 ac., with golf course and tennis courts. Jefferson Military college (chartered 1802), one of the oldest schools in the southwest, is 6 mi. from the city.

Natchez annually attracts thousands of visitors who enjoy the deeply shaded avenues and the old ante bellum homes of this section. The Natchez Garden club and the Pilgrimage Garden club, organized to preserve the historic and architectural beauty of Natchez, hold annual pilgrimages each spring. Forty or more outstanding historic homes are thrown open to the public each year.

Natchez is a trading centre and an important shipping point for industrial and agricultural products. Manufactures include woodworking, tires and other rubber products, rayon, pulp, boxes, candy, clothing and roasted coffee. The total industrial output at mid-20th century was valued at more than $10,000,000 annually. Natural gas is piped from the Louisiana fields and a high-powered transmission line from Natchez to Amite, La., gives to Natchez two-way electric transmission service.

The Natchez Indians were living there when Robert de la Salle and Henri de Tonti visited them in 1662, and when Le Moyne de Bienville in 1716 built a fort, which he named Rosalie, for the duchess of Pontchartrain. In 1764 Fort Rosalie passed from the French to the English and was renamed Panmure; in 1779 it was turned over to the Spaniards; in 1798 it was occupied by U.S. troops. The city was chartered in 1803. It was the capital of Mississippi from 1798 to 1802 and from 1817 to 1821.

NATHAN, ISAAC (1791?–1864), British author and composer, born at Canterbury, Kent, of Hebrew parentage, studied Hebrew at Cambridge university, preparing to enter the Hebrew priesthood. He wrote a number of songs and in 1815 published the first edition of *Hebrew Melodies,* with words by Lord Byron, whom he had met about three years previously. One of Nathan's most popular songs, "Why Are You Wandering Here?," was included in the comedy *Sweethearts and Wives,* produced in 1823, with words by James Kenney. In 1841 Nathan went to Australia, where he was killed in a traffic accident on Jan. 15, 1864.

NATHANAEL, THE APOSTLE: *see* APOSTLE.

NATICK, a town of Middlesex county, Mass., U.S., 18 mi. W.S.W. of Boston, at the southeast end of Cochituate lake. It is served by the Boston and Albany railroad. Pop. (1950) 19,838; (1940) 13,851. Natick is the Indian name ("our land" or "hilly land") of the tract (originally part of Dedham) granted to John Eliot in 1650 for the "praying" Indians. Until 1719 the Indians held the land in common, and for several years the community was governed (in accordance with Exodus xviii) by "rulers of tens," "rulers of fifties" and "rulers of hundreds." The town owns a copy of Eliot's Indian Bible. An Eliot monument was erected in 1847 near the site of the Indian church. Natick was incorporated as a town in 1781.

NATION, CARRY (1846–1911), U.S. temperance advocate, was born in Garrard Co., Ky., Nov. 25, 1846. Her father, George Moore, moved his family about so often that she had little schooling. In 1867 she married a drunkard; their brief unhappy life together prompted her later career of saloon-smashing in Kansas. With a few hymn-singing women, or alone, she would march into a saloon, sing, pray, hurl vituperations at all "rummies" present and smash the fixtures and the stock with hatchets. This crusade, most violent in the 1890s, led to scattered temporary efforts at law enforcement. After this period of "hatchetation" of "joints" —her words—she lectured in many states, in Canada and Great Britain, usually under no management but her own. For a while she made her speeches between acts of carnivals and burlesque shows.

The fact that her husband had been a Mason as well as a drunkard led her to fight fraternal orders along with saloons, and she added to her list of things to be destroyed tobacco, foreign foods, corsets, skirts of improper length, and paintings of the sort often found in barrooms. She was an advocate of women's suffrage, but neither the national movement for suffrage nor that for temperance gave her much support. Her second husband, David Nation, divorced her in 1901 on grounds of desertion after a marriage of 23 years. She died June 2, 1911.

Her autobiography, *The Use and Need of the Life of Carry A. Nation* (1904) is a hodgepodge of disorder.

NATIONAL ANTHEMS. The official patriotic songs of some countries, used on various national and other festive occasions and as greetings to the sovereign in countries under a crowned head, are known as national anthems, although the word anthem has a special ecclesiastical connotation that is not strictly suited to such songs, which would be better called national hymns. The following are or have been the national anthems of various countries:

Abyssinia: "Etiopia hoy, des yibalish," tune by M. K. Nalbadian (1925), words by a group of Ethiopian scholars (1930). *Argentina:* "Oid, mortales, el grito sagrado Libertad," words by V. Lopez y Planes, tune by J. Blas Parera (1813). *Australia:* "God Save the Queen" (see *Great Britain,* below); also used unofficially: "Advance, Australia Fair," words and tune by P. Dodd McCormick, and "Australia Will Be There," words and tune by W. W. Francis. *Austria:* After World War II: "Land der Berge, Land am Strome," tune by Mozart ("Brüder, reicht die Hand zum Bunde," from the Masonic cantata, K. 623, 1791), words by Paula Preradovic (1946). Under the empire: "Gott erhalte, Gott beschütze, unsern Kaiser, unser Land," words by L. L. Haschka, tune by Haydn (1797). After World War I: "Deutsch-Oesterreich, du herrliches Land," words by Karl Renner, tune by Wilhelm Kienzl (1920). After 1933: "Oesterreichische Bundeshymne" ("Sei gesegnet ohne Ende"), words by Ottokar Kernstock, to Haydn's tune. *Belgium:* "La Brabançonne" ("Après des siècles d'esclavage"), original words by H. L. A. Dechet (Jenneval), tune by F. van Campenhout (1830). In 1951 the tune was revised by a specially appointed commission and a fourth verse was added. A Flemish version was also prepared, with words by M. Herreman, which replaced "De Vlaamsche Leeuw," words by H. van Peene, tune by K. Miry (1845). *Brazil:* "Ouviram do Ypiranga as margens plácidas," words by J. O. Duque Estrada, tune by F. M. da Silva. *Bulgaria:* From 1950: "Bulgario mila, zemya na gheroi," words by Nikola Furnadzhiev, M. Isaev and Elisaveta Bagriana, tune by G. Dimitrov, G. Zlatev-Cherkin and S. Obretenov. Until 1946: "Shumi Maritsa," words by Marachek, tune by Gabriel Shebek; later version of words by N. Zhivkov. *Canada:* "God Save the Queen" (see *Great Britain,* below); also used unofficially: "The Maple Leaf Forever," words and tune by A. Muir (1867); French-Canadians, "O Canada! terre de nos aïeux," words by Sir A. B. Routhier, tune by C. Lavallée (*c.* 1880). *Chile:* "Dulce patria, recibe los votos," original words by B. de Vera y Pintado (1819), modified by E. Lillo (1847), tune by R. Carnicer (1828). *China:* Under the people's republic: interim anthem, tune by Niel Eel. After the 1912 revolution: "Tsung Kuoh hiung," words and tune anonymous (*c.* 1912). Later Kuomintang party song: "The Song of the Kuomintang," words from an address by Sun Yat-sen, tune by Ch'eng Mao-yün (1928). *Colombia:* "Oh! gloria inmarcesible," words by R. Núñez, tune by O. Sindici (*c.* 1905). *Cuba:* "Himno Bayamés" ("Al combate corred Bayameses"), words and tune by P. Figueredo (1868). *Czechoslovakia:* Czech, "Kde domov můj," words by J. K. Tyl, tune by F. Škroup (1834); Slovak, "Nad Tatru sa blyska," words by J. Matuška (1844), tune traditional. (These were combined in 1919.) *Denmark:* Danish royal anthem: "Kong Kristian stod ved højen mast," words by J. Ewald, tune probably adapted by J. E. Hartmann from D. L. Rogert (1779). Danish national anthem: "Der er et yndigt Land," words by A. Oehlenschläger, tune by H. E. Krøyer (*c.* 1819). Also used unofficially, "Den gang jeg

drog afsted," words by F. Faber, tune by J. O. E. Horneman. *Dominican Republic:* "Quisqueyanos valientes, alcemos," words by E. Prud'homme, tune by R. Reyes (1883, adopted 1900). Two others before that, including "Himno de Capotillo," tune by I. M. Caldéron (1865). *Ecuador:* "Salve! O patria!" words by J. L. Mera, tune by A. Neumann (1866). *Egypt:* Instrumental march by Verdi (*c.* 1872), words added by Arabic Music institution (1940s). *Estonia:* "Mu isamaa, mu õnn ja rõõm," words by J. Jannsen (1865, adopted *c.* 1917), tune by F. Pacius (1848, Finnish national anthem). *Finland:* "Maamme laulu" ("Oi maamme Suomi synnyinmaa"), words by J. L. Runeberg (1846), tune by F. Pacius (1848). *France:* "La Marseillaise" (*q.v.*), words and tune by Rouget de Lisle (1792). During the reign of Napoleon III: "Partant pour la Syrie," words by A. de La Borde, tune attributed to Queen Hortense of Holland, but probably by L. Drouet. *Germany:* German Federal Republic: "Einigkeit und Recht und Freiheit" (verse three of "Deutschland, Deutschland über alles"), tune by Haydn (*see* below) (adopted 1950). German Democratic Republic: "Auferstanden aus Ruinen und der Zukunft zugewandt," words by J. R. Becher, tune by H. Eisler (adopted 1949). The first German national anthem was "Heil dir im Siegerkranz," words by H. Harries (1790), modified by B. G. Schumacher (1793), tune "God Save the Queen" (see *Great Britain*, below) (adopted 1796). After World War I: "Deutschland, Deutschland über alles," tune by Haydn ("Gott erhalte," see *Austria*), words by A. H. Hoffmann von Fallersleben (1841, adopted 1922). *Great Britain:* "God Save the Queen," words and tune anonymous, first sung semiofficially at Drury Lane and Covent Garden theatres in London, arranged by T. A. Arne and Charles Burney respectively, after Sept. 28, 1745, when the defeat of the Jacobite rebellion was announced. It was then merely an expression of party loyalty to George II, and the words (*e.g.*, "confound their politics") referred to the Jacobites, not to some enemy of the country as a whole. The tune has been traced back, unconvincingly, as far as John Bull (1619) and its opening phrase, to the words "God save the King," appears in a catch by Henry Purcell (1685) as though quoted from a song already familiar, which may, however, be a coincidence. The later claims made for Henry Carey and James Oswald rest on no solid foundations. The words became slightly altered when the song came into use as the British national anthem and "Queen" was first substituted for "King" in Queen Victoria's reign. *Greece:* "Se gnorizo apo tin kopsi," words by D. Solomos (1823), tune by N. Mantzaros (adopted 1863). *Hungary:* "Isten áldd még a magyart," words by F. Kölcsey (1823), tune by F. Erkel (1845). *Iceland:* "O Gud vors land," words by M. Jochumsson, tune by S. Sveinbjørnsson (1874). *India:* "Jana Gana Mana," words by R. Tagore, tune attributed to him but probably traditional (adopted 1950). *Ireland, Republic of:* "The Soldier's Song" ("We'll sing a song"), words by P. Kearney, tune by P. Heaney (*c.* 1917, adopted 1937). *Israel:* "Hatikvah," words in Hebrew by N. H. Imber, English by Nina Salaman, tune based on traditional Hebrew melodies (adopted by the Zionist movement in 1907, by Israel in 1948). *Italy:* "Inno di Mameli" ("Fratelli d'Italia"), words by G. Mameli, tune by M. Novaro (1847, adopted 1946). From the foundation of the kingdom of Italy (1861): "Marcia Reale." *Japan:* "Kimi ga yo," words 9th century, tune by H. Hirokami, revised by F. Eckert (1880). *Latvia:* "Dievs, sveti Latviju," words and tune by K. Baumanis. *Lithuania:* "Lietuva, tévyné mūsu," words and music by V. Kudirka (1918). *Mexico:* "Mexicanos, al grito de guerra," words by F. Gonzalez Bocanegra, tune by J. Nunó (1854). *Netherlands:* "Wilhelmus van Nassouwe," words attributed to Philip van Marnix heer van St. Aldegonde (*c.* 1590), tune anonymous (first published, 1626). *New Zealand:* "God Defend New Zealand," words by T. Bracken, tune by R. A. Horne (adopted 1940); but "God Save the Queen" continues to be used. *Nicaragua, Republic of:* "Salve a te Nicaragua," words by Sálomon Ibarra Mayorga (written 1917), tune anonymous. *Norway:* "Ja, vi elsker dette landet," words by B. Bjørnson (1869), tune by R. Nordraak (1863–64). *Pakistan:* No official anthem had been chosen in 1953; "East Bengal" was sung as a national song. *Paraguay:* "Paraguayos, República ó muerte," words by F. Acuna de Figueroa, tune by F. Dupuy. *Persia:* "Shāhanshāh i mā Zandah bādā," words by S. Afsar, tune by N. Moghaddam (adopted *c.* 1934). *Peru:* "Somos libres, seámos lo siempre," words by J. de la Torre Ugarte, tune by J. B. Alzedo (1821), tune rewritten by C. Rebagliati (1912). *Poland:* "Jeszcze Polska nie zginęła," words by J. Wybicki (1797), tune traditional (*c.* 1795, adopted 1927, altered 1948, harmonized by K. Sikorski). *Portugal:* "Herois do mar," words by L. de Mendonça, tune by A. Keil (1890, adopted 1910). Before the republic: "O patria, O rei, O povo," words and tune by Pedro IV (Pedro I of Brazil). *Rumania:* "Te slăvim, România, pământ părintesc," adopted on Aug. 23, 1953, words by E. Frunza and D. Deşir, tune by M. Socor. Before 1947: "Trăească Regele in pace si onor," words by B. Alexandri, tune by E. A. Hübsch (1861). *South Africa:* "Die Stem van Suid-Afrika," words by C. J. Langehoven (1936), tune by M. L. de Villiers (adopted 1938), official English translation, 1952. *Spain:* "Marcha de Granaderos." Under the republic: "Himno de Riego." *Sweden:* "Du gamla, du fria, du fjällhöga Nord," words by R. Dybeck, tune traditional (adopted 1844). *Switzerland:* "Rufst du, mein Vaterland," words by J. H. Wyss (1811), tune, "God Save the Queen" (see *Great Britain*, above). *Syria:* "Humatal diyári 'alaikum salám," words by Khalil Mardam Bey, tune by the brothers Fulayfel (adopted 1939). *Thailand:* "Taurasben Barami," words and tune anonymous. *Turkey:* "Istiklal marsi," words by Mehmed Akif Ersoy, tune by Osman Zeki Ungor (adopted 1921). *United States of America:* "The Star-Spangled Banner," words by F. S. Key (1814), to the tune of J. Stafford Smith's song "To Anacreon in Heaven" (adopted 1931). Earlier, "My Country, 'Tis of Thee," words by S. F. Smith, tune "God Save the Queen" (see *Great Britain*, above) (1832); "Hail Columbia!" words by J. Hopkinson (1798), tune by P. Fyls (*c.* 1800). *U.S.S.R.:* "Gimn Sovietskogo Soyuza" (or "Song of Stalin"), original words by B. Lebedev-Kumakh (1942), rewritten by S. Mikhalkov and I. Registan (1944), tune by A. V. Alexandrov (1942). Used earlier by the U.S.S.R.: "L'Internationale," words (originally French) by E. Pottier (1871), tune by P. Degeyter. Tsarist Russia: "Bozhe Tsarya khrani," words by V. A. Zhukovsky, tune by A. Lvov (1833). *Uruguay:* "Orientales, la patria ó la tumba," words and tune by J. Coppetti. *Venezuela:* "Gloria al bravo pueblo," words by V. Salias, tune by J. Landaeta (*c.* 1810). *Yugoslavia:* Since 1945: "Hej Slaveni," words anonymous, tune traditional (the Polish national tune). Earlier: A composite of three songs: "Bože pravde ti što spase" (Serbian), words by J. Djordje, tune by D. Jenko (1872), "Lijepa naša domovino" (Croatian), words by A. Mihanović, tune by J. Runjanin (1846) and "Naprej zastava slave" (Slovene), words by S. Jenko, tune by D. Jenko. (E. W. Bm.)

NATIONAL ARCHIVES, U.S. The national archives and records service is a part of the General Services administration. It consists of the national archives, the records management division, the Federal Register division and the Franklin D. Roosevelt library in Hyde Park, N.Y. It is headed by the archivist of the United States, who is also chairman of the National Historical Publications commission.

Its functions are to promote efficient management of records throughout the government; to facilitate orderly destruction of federal records no longer needed and economical storage of those needed for a short time only; to preserve, describe and service those selected for permanent preservation; to publish the *Federal Register*, the *Code of Federal Regulations*, the statutes at large and the *United States Government Organization Manual;* and to supervise collections in the Franklin D. Roosevelt library. By the 1950s there were about 800,000 cu.ft. of records in the national archives dating from the Revolutionary War through World War II and including more than 250,000 sound recordings, 900,000 maps and charts, 2,000,000 pictures and about 75,000 reels of motion-picture film.

The Declaration of Independence, the constitution of the United States, the Bill of Rights and many other famous documents relating to United States history were placed on display in the National Archives Exhibition hall.

Reproductions of the three great documents are available in an inexpensive publication, Charters of Freedom, and facsimiles

of such documents as the Emancipation proclamation are also on sale. Certain records of high research value are also available on microfilm at low cost. (W. C. G.)

NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE. In Jan. 1909 Mary White Ovington, William English Walling and Henry Moskowitz met in New York, N.Y., to discuss problems of discrimination against the Negroes in the United States. A campaign was begun Feb. 12, Abraham Lincoln's birthday, to call a national conference "for the discussion of present evils, the voicing of protests, and the renewal of the struggle for civil and political liberty."

The conference was held on May 30, 1909, at the Charity Organization hall, New York city, and a committee of 40 was formed to begin the national work. At the second conference held in New York in May 1910, the N.A.A.C.P. was organized as a permanent body. W. E. B. DuBois became an executive in the association, and publication of the *Crisis* magazine was begun in Nov. 1910 with DuBois as editor and Mary Dunlop MacLean as managing editor. In the early 1950s there were approximately 250,000 members.

NATIONAL BETTER BUSINESS BUREAU: *see* BETTER BUSINESS BUREAUS.

NATIONAL CITY, a city of San Diego county, southwest California, U.S., in the San Diego metropolitan area, about 10 mi. N. of the Mexican border. Pop. (1950) 21,199. National City is situated on federal highway 101 and is served by the Atchison, Topeka & Santa Fe and the San Diego and Arizona Eastern railroads. Several airports are near by. The city's products are largely agricultural.

NATIONAL CONVENTION, THE. In the United States the national convention is the representative organ of the political parties which nominates candidates for president and vice-president, adopts the platform and performs other party functions. National nominating conventions were held by the Federalist party in 1808 and 1812. These gatherings of party leaders were held privately and no proceedings were published. They were not in form representative assemblies of the party, and they had no influence on the displacement of the congressional nominating caucus by the national convention. The Anti-Masonic party met in national convention at Baltimore, Md., in Sept. 1831. This convention was composed of 112 delegates for 13 states and adopted "An Address to the People of the United States." The National Republican or Whig party followed with a convention at Baltimore in Dec. 1831, with each state entitled to a delegation the size of the electoral vote of the state. A system of state and local correspondence committees was authorized. The Democratic party held its first national convention in Baltimore in May 1832, for the purpose of nominating Martin Van Buren for vice-president, as the running mate to Pres. Andrew Jackson. Since then the national convention has been the recognized method of selecting presidential and vice-presidential candidates.

While the number of delegates in the early conventions fluctuated, ordinarily each state was limited to a vote equal to its electoral-college strength. Eventually twice as many delegates were sent as there were electors, and finally each delegate was given an entire vote. The Democratic party adhered to these rules through the convention of 1940, which decided that thenceforth each state casting its vote for the Democratic presidential candidate should be allowed a bonus of two votes in the succeeding national convention. The national committee increased the bonus to four votes in 1947.

The Republicans formerly allowed each state twice as many delegates as its electoral vote, but the rule was altered in 1913, 1923 and 1940 to lessen the number of delegates from the normally Democratic states of the south. The 1940 rule allotted to each state two delegates for each senator and representative at large. Three additional delegates were allowed if the state cast a majority of its electoral vote for the Republican nominee at the preceding presidential election or elected a Republican senator at the preceding congressional election. One delegate was allotted to each congressional district casting 1,000 Republican votes at the preceding presidential or congressional election. Another delegate could be chosen from a district if its Republican vote exceeded 10,000 at either of such elections. With delegates from the territories, dependencies and District of Columbia, in 1948 the Republicans had 1,094 delegates, the Democrats 1,234. For each delegate, an alternate is chosen to act in the absence of the delegate. The Democrats permit states to send more than the allotted number of delegates and give to each a fractional vote.

In the December or January preceding the convention, the national committee of each party meets in Washington, D.C., and issues the call for the next convention. At this time the allotment of delegates is made and the state committees are instructed as to how they are to be chosen. A convention city also is selected, giving consideration to auditorium facilities, hotel accommodations, financial donations and political benefits. The convention delegates are elected by state and district conventions, by state party committees, or by the voters acting through presidential primaries in about one-fourth of the states. They are either instructed as to presidential preference or are sent uninstructed; some are instructed as to vice-president. Prior to the convening of the convention, usually in June or July, the national committee meets to make final arrangements for the convention. A temporary roll of convention delegates is made and a temporary organization is suggested for the convention.

The chairman of the national committee calls the convention together and the first question is on temporary organization. After temporary organization has been effected, the temporary chairman makes a keynote speech sounding the campaign issues. Then the committees on rules and procedure, credentials, permanent organization and platform and resolutions are appointed, the members being nominated by the state delegations.

After the adoption of rules and the report on credentials, a permanent organization is effected. The permanent chairman also speaks in outline of the campaign issues. The convention then proceeds to nominate candidates and adopt a platform. Nominations for president are made by calling the roll of delegations. Seconding speeches often are made. A majority vote is necessary to nominate; until 1936, however, the Democrats required two-thirds to nominate. After the candidate for president is nominated, a choice for vice-president is made along the same procedure. A platform is adopted either before, during or after the nominations. Committees on notification of the two candidates are named and the convention adjourns after authorizing the national committee to fill any vacancies on the ticket.

The national committee, composed of a man and woman from each state and territory, assumes office upon adjournment of the convention, the members being selected by the delegations or by state conventions or primaries if so authorized by state statutes or party rules or by state conventions.

NATIONAL COUNCIL OF EVANGELICAL FREE CHURCHES, a voluntary association of British Nonconformist churches for co-operation in religious, social and civil work. It was the outcome of a unifying tendency displayed during the latter part of the 19th century. About 1890 the proposal that there should be a Nonconformist Church congress analogous to the Anglican Church congress was seriously considered, and the first was held in Manchester on the 7th of November 1892. In the following year it was resolved that the basis of representation should be neither personal (as in the Anglican Church congress) nor denominational, but territorial; and the name of the organization was changed from congress to national council as soon as the assembly ceased to be a fortuitous concourse of atoms, and consisted of duly appointed representatives from the local councils of every part of England. The local councils consist of representatives of the Congregational and Baptist Churches, the Methodist Churches, the Presbyterian Church of England, the Free Episcopal Churches, the Society of Friends and such other Evan-

gelical Churches as the National Council may at any time admit. The constitution states the following as the objects of the National Council: To facilitate fraternal intercourse and co-operation among the Evangelical Free Churches; to assist in the organization of local councils; to encourage devotional fellowship and mutual counsel concerning the spiritual life and religious activities of the Churches; to advocate the New Testament doctrine of the Church, and to defend the rights of the associated Churches; to promote the application of the law of Christ in every relation of human life. Although the objects of the Free Church councils are thus in their nature and spirit religious rather than political, there are occasions on which action is taken on great national affairs. The movement differs essentially from the Evangelical Alliance, inasmuch as its unit is not an individual, private Christian, but a definitely organized and visible Church. The essential doctrine of the movement is a particular doctrine of churchmanship which regards the Lord Jesus Christ as the sole and Divine Head of every branch of the Holy Catholic Church throughout the world.

The report of the National Free Church Council is published at the headquarters of the organization, the Memorial hall, Farringdon street, London E. C. The Report for 1927–28 shows that England, Wales and the Channel Islands have been covered with a network of councils, each of which elects its representatives to the annual gathering. The movement has spread to Australia, New Zealand, South Africa, Jamaica, the United States of America and India.

NATIONAL DEBT. A public debt is any obligation for the preservation or extinction of which a state is willing to devote its resources. "National debt" refers to the indebtedness of a central government, as distinct from that of a state, provincial, or subordinate political unit. Like any other debt it is a recognized obligation to pay a definite sum of money, either on demand or after specified notice, or on a definite date, or in instalments coming due on a series of dates. A national debt is both a contractual and moral obligation. Gaston Jèze, the eminent French jurist, limits public debts to those originating in "an act of borrowing"—that is, in a voluntary transaction between the state and the lender. But a forced loan, under which a state uses legal compulsion to secure capital, is no less a part of the national debt, if, or so long as, the obligation of repayment is recognized.

National debts are the debts of a political entity. They are not the aggregate debts of its citizens. Nor is private property, save through taxation, subject to seizure for payment of public debts. The state, moreover, fixes the rules under which it can be sued both for its torts and violation of contracts. Without its consent claims against it are not enforceable. Its debts are only those claims the state recognizes as such.

Because of the fact that resources of citizens are taken by taxation to pay interest or to retire the principal of national debts, these obligations are sometimes called "mortgages on the wealth and income of the people of a country," or "a lien on the income of taxpayers." Jèze called public loans "a financial device whereby receipts of imposts and taxes are anticipated." Lord Stamp was of the opinion that "apart from their psychology, borrowing and taxation are interchangeable; there is no external difference between the intermediate effect of borrowing and taxation. They both mean that there are fewer tickets, and so fewer goods for the taxed person or for the lender to consume."

What Is Included and Excluded.—Public debts of various nations are not strictly comparable. They differ in inclusiveness because of variations in political structures (as in unitary or federated governments), in functions performed, and in accounting procedures employed. The gross public debt of the U.S., for example, is composed of the direct obligations of the federal government including obligations carried over from the Civil War, World Wars I and II, building the Panama canal and financing the relief-recovery program of the 1930s. The debt includes interfund borrowings, such as from the old age and survivors' insurance trust fund, the railroad retirement account and the postal savings system. It includes obligations on which interest has ceased, as where issues have been called for payment but not presented; it includes also noninterest-bearing debts such as savings stamps, demand notes and fractional currency issued at the time of the Civil War and not retired, legal tender notes and national bank notes. The U.S. gross debt does not include the contingent liabilities of the government, unless specifically stated as "the gross debt and guaranteed obligations of the U.S."

The contingent liabilities of the U.S. are authorized obligations issued by certain government corporations and agencies guaranteed as to payment of principal or interest by the U.S., or issued on the credit of the U.S. Among the issues *guaranteed* by the U.S. were obligations of the Commodity Credit corporation, Federal Housing administration, Reconstruction Finance corporation and the Tennessee Valley authority. Deposits in the U.S. postal savings system are issued "on the credit of the United States." On Oct. 16, 1941, the treasury announced that thereafter it would provide funds needed by government corporations and agencies, and that the sale of obligations by these agencies would be discontinued. Maturities and redemptions of such outstanding issues were thereafter handled by the treasury. The distinction between direct and guaranteed debt in the U.S. will disappear in the course of time. The contingent liabilities of the U.S. for financing of corporations and agencies decreased from $6,360,000,000 on June 30, 1941, to $27,000,000 on June 30, 1949. Loans for these public authorities were now included in the direct debt. A saving in interest costs was a result of the new arrangement.

Many other countries follow the practice of excluding contingent liabilities from the gross debt. The primary exclusion is for issues of central banks, (*e.g.,* federal reserve notes are listed as "other obligations" rather than as "guaranteed by" or "on the credit of the U.S.," in tabulations of contingent liabilities, but are not included in statistical totals for guaranteed debts. On June 30, 1949, federal reserve notes outstanding amounted to $23,209,000,000.) In Italy, on the other hand, paper money and bank advances are considered as part of the national debt. Among the liabilities also generally excluded from public debt statements in the U.S. and United Kingdom are unpaid wages and salaries, unpaid rents, interest accrued but unpaid, open book accounts payable, liabilities under pension systems, judgments and adjudicated claims. Occasionally such liabilities are funded and hence are embraced within the national debt. For example, certain obligations to war veterans in the U.S were met by the issuance of 3% Adjusted Service bonds in 1936. It may be argued, however, that this was in satisfaction of a moral claim rather than the funding of a current liability. Indemnities imposed by foreign states usually are excluded from debt statements.

Political loans have at times been concealed. Practices have also varied as to foreign debts. France, for example, carried the Morgan loan in its statement from 1871 until 1875, when it was repaid. Its foreign debts from World War I were included from 1916 to 1932, when payments were suspended under the Hoover moratorium (1931) and the Lausanne conference (July 1, 1932). After Dec. 31, 1934, no foreign debts appeared in the French statements of public debts. Italy traditionally separated foreign indebtedness from its domestic public debt statements. The U.S.S.R. excluded all foreign loans contracted under the tsarist regime.

Debt statements often reflect the various undertakings or industries owned and operated by governments. Railroad debts have been included among the debts of Frence, Germany, Switzerland, Canada and Japan. Capital expenditures for canals, telephone and telegraph systems, harbours, hydroelectric plants, housing, highways, armaments, etc., have been financed by public borrowing. In some cases the issues have been for designated purposes, in other cases they have been covered by general loans.

Types of Public Credit.—Public debts may be classified and identified by types. The use of the classification depends upon the purpose at hand. There are geographical as well as chronological variations in terms and usages. The following classification will cover most common usages. The groups shown are not mutually exclusive.

Gross debt refers to the total amount of debt outstanding. It ordinarily includes the sum of all obligations, funded and floating,

except contingent liabilities.

Net or dead-weight debt is the gross debt less sinking fund or other assets dedicated to the retirement of such debt. "Dead weight" is in more general usage in England than in the United States.

External or foreign debt is a debt owed to a nonresident national, or to a foreign creditor or state. The payment of interest or principal on an external debt involves the transfer of goods or services to another country. At the time of the loan, however, the debtor received goods, services or capital from abroad. Indemnities and reparations debts, by their nature, belong in this group. At the time of imposing the obligation, usually by force of arms or by treaty concluding a war, no *quid pro quo* was involved. Payments, however, represent transfers from the debtor to the creditor country.

Internal debts include loans within a state to the government thereof; or loans held within the debtor country and payable therein. Internal loans involve transfers within the debtor country. At the time of the loan, capital goods or services are placed at the disposal of the government. At the time of payment of interest or principal, taxpayers are deprived of resources for transfer to domestic holders of the debt (less costs of administration) In view of the transfer aspects of internal debts, the country as a whole is neither richer nor poorer as a result of the loan or its repayment, unless deleterious effects are produced by taxation for debt service or the loans cause a decrease in the efficiency of the use of capital.

Funded debt is a term of English origin derived from the fact that the interest due was originally paid from the proceeds of certain taxes or funds. Gradually the meaning was extended to cover debts due at some distant date, or to refer to formal obligations, like consols, redeemable at the pleasure of the government but not repayable at any definite time. The term "funding system" referred to the process of creating the funded debt, although most writers devoted their attention to the evils of the system. Early English works on borrowing made general use of the term "funding." See for example David Ricardo's "Essay on the Funding System" in Supplement to *Encyclopædia Britannica,* 1824, or J. R. McCulloch, *Treatise on the Principles and Practical Influence of Taxation and the Funding System* (1845). Sir Robert Palgrave (*Dictionary of Pol. Econ.*) says that it was customary to associate the term "funding" with an agreement to repay a greater sum than was received, as happens when bonds are sold at a discount.

Floating or unfunded debt.—It is usual to define the floating debt as being unfunded. In essence it is a temporary or short-term indebtedness. It may be incurred as a result of an emergency, a temporary shortage of revenues, a lack of synchronization between the receipt of revenues and due dates of obligations, or even by reason of repeated failures to levy sufficient taxes to meet current expenditure requirements. In Britain and the U.S. floating debt generally refers to debts payable within one year. The League of Nations so classified debts payable within two years. In early usage the term referred to all except funded debts, specifically including accounts, warrants, commissary certificates, obligations issued for commandeered military supplies, unliquidated claims for services or supplies and even fiat money. It is now generally limited to liabilities in recognition of which the government has issued some type of paper (obligation). Therefore, it does not ordinarily include open accounts, unpaid wages, rent accruals or similar liabilities. The obligations given vary widely as to form. Often they are carried over from year to year and end by being funded into longer term debts. The conventional attitude is that floating debts should be kept at a minimum and, instead of being funded, should be paid as soon as practicable.

Long-term debt refers to obligations having a maturity date ten or more years after issue. It includes "perpetuities," or perpetual debts, which are loans having no fixed date for repayment but nevertheless are redeemable. British consols are of this type. When debts are classified into two groups, long- and short-term, the dividing line is usually placed at five years. This dual classification is not as satisfactory, particularly for purposes of analysis, as the threefold grouping into long-term, intermediate and short-term issues.

Intermediate debt refers to obligations having maturities of from five to ten years after issue. Many U.S. treasury notes fall in this category.

Short-term debt refers to obligations with maturities of less than five years. In the U.S. they have been used mainly in time of war or monetary crisis, and have been an outstanding feature of federal finance since World War I. In England, except for a few exchequer bonds introduced by William Ewart Gladstone, they were also the creation of World War I and have been widely utilized ever since. The role of short-terms has thus changed from an emergency expedient to that of a permanent feature of regular borrowing programs. Treasury bills and certificates of indebtedness are typical short-terms issued by the U.S.; treasury bills and ways and means advances are English examples. Notes, certificates, etc., sold in anticipation of the receipt of funds from subsequent bond issues also belong in this group. In France, short-term debt appeared in statistics after 1816, but took on great importance only during and after World War I, as was also the case in Germany and Italy.

Marketable debt is composed of securities which may be sold by owners on the open market. Among the marketable issues of the U.S. are consols of 1930, Panama canal loan bonds, Liberty bonds, treasury bonds, treasury notes, certificates of indebtedness and treasury bills. The term is synonymous with "negotiable." British, as well as most European, securities also are typically of the marketable variety. Such for example, were the Victory bonds of 1919, the conversion loan of 1924, and the national war bonds (1941 *et seq.*) issued by the U.K.

Nonmarketable debt is composed of securities which cannot be freely sold by holders. When owners desire to convert them into cash, or other government securities, they must be presented to the treasury, or designated agents, for redemption at values usually declared at time of issue. Redemption at stated figures removes the risk of fluctuations in market prices. Lack of negotiability is ordinarily compensated by the rate of interest paid. These securities are designed primarily for low-income groups who can ill afford to risk capital losses from price fluctuations. Nonmarketable issues of the U.S. include savings bonds, depositary bonds and treasury tax savings notes. The U.K. national savings certificates issued during World War II are of this type.

Special issues are interest-bearing securities issued (specially) by the treasury for the investment of trust and other funds deposited in the treasury. They are obligations arising from inter-fund borrowing. They are not publicly issued, nor are they marketable. Interest paid is typically controlled by statute. Among U.S. special issues outstanding at mid-20th century were: (1) treasury notes given to the federal old-age and survivors insurance trust fund, or to the civil service retirement fund; (2) certificates of indebtedness, issued to the unemployment trust fund.

The relative importance of marketable, nonmarketable and special issues in the U.S. government public debt shows some variation over time depending on treasury policies and economic conditions, as may be seen from the following table (amounts in millions):

	Dec. 31, 1944	Sept. 30, 1949
Total U.S. debt outstanding (direct and guaranteed obligations)	$232,144	$256,709
Marketable issues	161,648	155,647
Nonmarketable issues	50,917	65,195
Special issues	16,326	33,914
Matured debt and debt bearing no interest	1,783	1,923
Guaranteed obligations	1,470	29

Interest-bearing debt includes all issues on which a government promises to pay interest, whether directly or by way of accumulations added to the issue price. Liberty bonds were of the coupon variety, interest being paid through banks upon presentation of coupons on their due date. Series E savings bonds issued by the U.S. during and after World War II were sold on a discount basis ($25 bonds issued at $18.75), interest being added to issue price at

rate of 2.9% if held to maturity. (Maturity value at end of ten years, $25.)

Noninterest-bearing debt denotes public securities issued without promise of payment of interest. Fiat or paper money is the typical illustration. As governments exhaust taxing power and voluntary borrowing they have tended to turn to such issues. The relative importance of noninterest-bearing issues tends to increase at such times. Some temporary issues, such as savings stamps, carry no interest because these debts are expected to be exchanged into more permanent form, because individual investments in them are nominal, and because of administrative difficulties in arranging to pay interest. At mid-century the most important debt of this type was the special notes of the U.S. to the International Monetary fund. Matured debt on which interest has ceased is not included in this category.

Redeemable debt includes issues as to which the government is under obligation to pay cash, usually at stated values, upon presentation prior to maturity.

Nonredeemable debt includes issues which the government has not promised to exchange for cash prior to maturity. Holders desiring to receive cash prior to maturity are usually free to sell in open market. Frequently issues are nonredeemable until after the lapse of a specified period. Redemption is sometimes determined by lot.

Callable debt consists of obligations which the issuing government is free to redeem at its convenience, or after the lapse of a specified time subsequent to issue, depending upon the agreement. The privilege of calling bonds for redemption prior to maturity enables the government to convert the debt so as to secure savings from lowered interest rates. Insertion of call privilege in contract is supposed to require payment of a slight extra premium over loans sold without such provisions, so as to cover uncertainty as to the life of the investment. This extra premium is not always exacted by lenders.

Noncallable debt consists of public obligations which do not contain the contractual right of redemption prior to maturity.

Government obligations are debts of issuing governments backed by the faith and credit of such governments. They are sometimes called direct debts.

Government guaranteed debts are obligations for the ultimate repayment of principal and interest of which a government has pledged its credit and resources.

Voluntary loans result from borrowing involving no element of coercion, direct or indirect, or conditional exercise of taxing power or implied use of administrative or regulatory authority. They refer to loans made in a free market by willing lenders. Only in exceptional cases are loans otherwise than voluntary. That a free market can be relied upon for public borrowing is an indication of the maturity of governments as institutions, of the stability of credit and of the high state to which economic and financial institutions, including an organized money market open to all, have evolved in the modern world

Compulsory or forced loans are transfers of goods, services or capital to the use of a government brought about by the exercise of force, or the threatened use thereof upon failure to effect transfers of capital, but accompanied by a promise of repayment, or indemnification, with interest. The earliest loans seem to have been of this type, reflecting either the lack of a basis for voluntary credits, or the power of absolutist sovereigns to wrench capital from unwilling subjects or easy victims of political power. In England forced loans were originally raised from foreigners, especially Jews and Italian bankers. In the 15th century native lenders were common. Charles I employed a forced loan to finance an unpopular war with France and its failure led the third parliament in 1628 to draw up a Petition of Right outlawing forced loans without the consent of parliament. Forced loans were employed in the city republics of Italy as early as 1171, but their precise origin is unknown. Their record of repayments was, on the whole, fairly good, and in due course Italy pioneered the development of voluntary credit institutions and techniques, and transplanted them into northern Europe. France made some use of forced loans after the Revolution. Prussia utilized treasures during the 18th century to finance wars but these were exhausted by 1794. Among the expedients subsequently utilized were coinage debasement, lottery loans and, in 1809, the delivery of all articles of gold and silver in return for certificates payable in coin. There was another forced loan in 1810. Out of exhausted credit and the ruthlessness of kings came the early antipathy to forced loans. From 1815 to 1914 there were few forced loans throughout the world.

During World War I and its aftermath, forced loans again appeared to reinforce weak taxation, or to drive through voluntary loans. In France, Britain and the U.S. it was argued that forced loans were appropriate if men were drafted for military service. Such loans were employed (1914–22) in Australia, Czechoslovakia, Germany, Greece, the Netherlands, Italy, New Zealand, Norway and Poland without conspicuous success. In the U.S. during the war, many local committees adopted coercive methods to secure subscriptions to war bonds.

In the financing of World War II, forced loans, or forced saving plans, were employed in Great Britain, New Zealand, Japan, Germany and Italy. In Canada (1942–43), they were euphemistically termed "refundable taxes." The victory tax in the U.S. and the excess profits tax in England with their postwar credits bore close resemblance to forced loans. Japan imposed forced loans in some of the occupied areas of southeast Asia, as well as at home, during World War II. The degree of compulsion exerted in some places in the U.S. to secure subscriptions to Series E war bonds should not be ignored. Many economists in Britain and the U.S. (especially J. M. Keynes) favoured compulsory loans during the war not only to aid in financing that undertaking, but as a means of mopping up purchasing power to help prevent inflation. This, in part, accounts for the forced saving incorporated in the British wartime personal income tax. This use of forced loans was in marked contrast to early usage. At first it was an instrument directed at the wealthy few, by a state with imperfect credit standing. During the 1940s it was aimed at the masses, the holders of the bulk of purchasing power. In its modern use it is really a form of universal saving or a refundable tax and, when popularly sanctioned, may be used increasingly in the future by governments fully able to borrow by other means, which also will be utilized.

Among the practices which, from time to time, have been denominated forced loans are: military requisitions, fiat money, currency debasement, withdrawal of conversion privilege from legal tender notes (as in the U.S. in 1863), the unilateral alternation of terms of loan contracts by the issuing government, and the appropriation of bank deposits, or portions thereof, by the government.

Bond anticipation borrowing is a form of short-term credit issued prior to the floating of a large bond issue from the proceeds of which the temporary anticipatory borrowings are to be retired. The use of interim short-terms makes possible the timing of long-term issues to coincide with better market opportunities.

Tax anticipation borrowing refers to short-term borrowing by the government in advance of the receipt of taxes soon to be in process of collection. The U.S. direct-tax loan of 1815 was of this type. This form of borrowing is more frequent in state and local governments than in national units. Such loans are usually secured only by the tax receipts anticipated and are in reality borrowings of "funds" rather than of governmental units. Such loans are to be distinguished from securities sold to taxpayers to permit them to prepay taxes or to save via government security purchases sums needed to meet tax liabilities. The tax anticipation warrants issued by the city of Chicago are examples of true tax anticipation borrowing, while the U.S. treasury tax notes issued subsequent to 1943 are illustrative of plans devised to help the individual accrue (save for) his tax liabilities. In both cases, however, the government secures use of capital prior to tax-payment dates

Differences Between Public and Private Credit.—Many of the differences between public and private credit are due to differences between the state and the individual. The state has jurisdiction over all individuals in the social group; it is responsible for their welfare. It controls their actions, determines what they may do, establishes rules of conduct, provides opportunities for

earning a living, regulates the ownership of property and provides the means through which wrongs may be redressed and breaches of contract indemnified. The state is the creator of credit and the agency which delegates this function to others, when it is lodged in private hands. Since the state makes the rules concerning credit creation it must be careful not to discriminate in its own favour, if a system of voluntary borrowing in a free market is to develop. Lack of such discrimination can be interpreted as one sign of the fiscal maturity of governments. Similarly the state must respect the financial institutions it creates. The state, too, has a permanence—a length of life—not possessed by the individual. The stability of government is reflected in its credit, and vice versa. This stability affects the risks investors must assume. The earning power of the individual is cut short by death; that

*Fiscal years as of which data are reported vary as between countries and over the period covered for the same country, as a rule. Data for 1940 on, unless especially noted, taken from *Public Debt, 1914–1946*, United Nations, Department of Economic Affairs (1948).

†The data from 1697–1828 inclusive are gross national debt figures from *The National Debt* by E. L. Hargreaves, p 291 (London, 1930). The data from 1836–1935 inclusive are "net national debt" figures compiled from British official "Accounts and Papers" by subtracting exchequer balances from total debt.

‡Data from 1791 to 1850 taken from *Annual Report of the Secretary of the Treasury on the State of the Finances for the Fiscal Year Ended June 30, 1903*, p. 63; from 1855 to 1935 from *ibid.*, pp. 562–63 (1943). Recent years taken from *Treasury Bulletin*, p 16 (Nov. 1949).

§Data at the end of the calendar year, 1949. Source: Ministère des Finances: *Statistiques et Etudes Financières, Supplement Statistiques*, nos. 1–2, p 237 (1949). Data for 1940 and subsequent years taken from *Public Debt; 1914-1946* (United Nations Department of Economic Affairs, 1948); *Public Finance Data 1938–49* (United Nations Document E/C.N. 8/31 and Annexes, mimeographed); *United Nations Statistical Yearbook 1948;* and recent issues from the *Treasury Bulletin*. All data up to 1935 are computed from the *Annuaire Statistique de la France*.

‖From the *Statistische Jahrbuch für das Deutsche Reich* except for 1940 and 1943 which are from *Bank for International Settlements, Thirteenth Annual Report*, (*May 1944*).

¶These data were computed from Japanese government sources, especially the *Financial and Economic Annual of Japan*, Department of Finance.

♀Data taken from *The Canada Yearbook* prior to 1940.

δThe total gross debt of U. S. on January 1, 1835 was $33,733.05.

of the state runs on. Its life may not be permanent, but ordinarily it is not fleeting. Its greater resources, lodged in the power to tax all individual wealth and income as well as to utilize its own public domain, give greater certainty of payment to obligations than the individual can provide. The state can compel the individual to pay his debts; only the combined wills (the mores) of the citizens, or external force, can compel the state to pay its debts. But the moral force for observance of public contracts is part of the heritage of modern states.

There was a time when it was said that the loans of the state were unproductive, going to pay for the wastes of past wars, or to finance useless undertakings, whereas private loans were investments, providing employment and raising the standards of living for citizens. Such notions hark back to the time when governments were regarded as unproductive and when tax payments were believed akin to losses. Modern students recognize that governments supply valuable utilities and that they make real contributions to economic and social welfare. Even the preservation of liberty, which has occasioned war debts, may be regarded as productive. What is regarded as unproductive, and there are ample illustrations in public and private spheres, is often determined by the political beliefs or ideologies of the critics, rather than by the economics of the case.

The purposes of public and private borrowing are numerous. Both the state and the individual may borrow to acquire goods. Both cause transfers from those who previously have saved wealth, or who create it for the purpose at hand. Both may borrow to add to the wealth under their control, although the state scarcely needs to borrow to acquire such control. The state, on the other hand, may borrow to avoid present taxation, to supply individuals with a safe place for investment of funds or to provide a basis for a monetary or banking system. The individual can borrow only to the extent of his own resources; the state can borrow on the resources of all and can create credit of its own in addition, so long as it possesses the power to reinforce its promises with an ability to pay interest, or can maintain the confidence necessary to keep its credit instruments circulating at or near par. When a state exhausts its taxing power its credit sags. The extent to which a state can tax the resources of its citizens depends upon the public services provided and upon the emergencies at hand. The degree to which private wealth may be taken by the state is conditioned by the time, place and circumstances surrounding the event. Actually, though not legally, expropriation by the state, for debts or current services, is subject to limits. Even docile citizens may rebel or vote a debt-creating government out of power.

Evolution of National Debts.—Public debts are a product of political and commercial evolution. They do not arise until there is a political differentiation between the ruler and the state. The borrowings of the sovereign, secured by his jewels or domainal revenues, were personal rather than governmental obligations. The debts of one ruler were seldom assumed by his successors. If public debts were to have permanence or stability, governments had to develop a continuity apart from that of the sovereigns. They had to secure regular and compulsory sources of income independent of privileges and feudal dues. Likewise, negotiation and voluntary subscription had to replace force, grants of privileges or confiscatory exactions as alternatives to voluntary loans. On the commercial side, credit institutions had to replace the wealthy subject who could be prodded into surrendering capital, or the ecclesiastical orders who could be persecuted and alienated from their domains. A monetary system of reasonable stability had to develop. These came with the rise of commerce and industry. The appearance of exchanges not only aided in financing new developments but made liquid the bulk of public and private debt instruments. Rising incomes and the diffusion of wealth and income in society made possible the ownership of public securities by the masses and their financial institutions. The public debt frequently became a coveted type of investment.

The stages in the development of public debts seem to run from public treasures for emergency use to forced loans, from loans to the sovereign to loans to the state, from loans anticipat-

ing taxes (or other revenues) to permanent obligations based upon the promise of the state to apply its resources to interest and the eventual repayment or refunding of the debt. In the evolution of the state from absolute to democratic rule, forced loans of the original type were virtually outlawed; and taxes as well as loans and expenditures required the sanction of legislative assemblies or of the electorate. As governmental functions increased, the needs for borrowing also rose. These steps were complete by the time modern governments appeared. To them public credit was a full-blown instrument of fiscal policy.

No histories of public debts, comparable with the notable histories of taxation, have yet been written. Hence, the development of this institution can be sketched only in fragmentary fashion. The public credit institutions seem to stem from the Italian city banks: the Bank of Venice (1156), the Bank of St. George (1407) of Genoa and the Bardi of Florence. The Italians helped school the Dutch in financial methods. It was from the Netherlands that public borrowing from private bankers and financial institutions spread to German cities and to England and France. Transplantation to the new world followed as a matter of course. Jèze says that public credit is essentially a product of modern times, developing after the end of the 18th century. H. C. Adams thought that conditions requisite for public borrowing were not realized until the latter part of that century. C. F. Bastable added the observation that the last 50 years of the 19th century were even more important for the development of public credit than the two preceding centuries. All writers agree that the evolution of public credit coincides with the development of the state as an institution and with the development of an industrial commercial civilization with its attendant economic and financial institutions, especially banks and security exchanges with their ancillary agencies, to facilitate transfers and to provide an open market for the purchase and sale of debt instruments. A legal system for the enforcement of contracts, and social mores which require performance of contractual obligations assumed, particularly for the payment of interest and principal, are important. The development of a system of private credits, accounts and records, as well as surplus incomes available for investment, have done much to carry public borrowing as an institution to modern levels.

Growth of National Debts.—The growth of national debts in the U.K., U.S., France, Germany, Japan and Canada is presented in Table I. The series begins with 1697, the earliest date for which U.K. data are available, and picks up the series for the U.S. in 1791. French data begin with 1815 because regular financial statistics were introduced after the end of the Napoleonic regime. The Canadian series starts at the beginning of confederation; German data start with the first year of the modern *Reichsschuld;* the Japanese series begins with the first public loan after the Meiji restoration, floated in London in 1870.

Outstanding Debts of Principal Countries of the World.—The gross national debts outstanding in the principal countries of the world are shown in Table II.

Relation between Public and Private Debts.—The claims of creditors upon the income of debtors are in the nature of a lien to be discharged before debtors are free to spend or enjoy the resources remaining. In the case of private debts payments are voluntary but are made so that credit standing (the opportunity for future loans) may be maintained. Public creditors have their claims satisfied by revenues received from taxes; the state also fulfils its contractual obligations so that it may borrow again. Both types of debt service represent drains on current income for resources made available in the past. The productive use of the sums borrowed may, however, create the means of payment, yet with fluctuating incomes the burden of debt charges also fluctuates. What the individual borrows, and the charges on his income, he is generally in position to control. What the state borrows will, through taxes, affect the size of the personal income remaining. Individuals per se are seldom able to control the volume of public debts or the resulting debt charges. The claims of the state are superior to those of individual creditors, but the claims of both not only affect individual welfare but also the formation of capital and the volume of consumer spending. Taxes and public borrowing tend to reduce current income, or capital, available for investment or consumption. Public expenditures and payment of interest or principal reverse the process and tend to augment the flow of income or capital. Payments by individual debtors to their creditors are like payments of external debts—they tend to drain the individual's economy for the benefit of "foreign creditors." Payments to and by the state, because of internal loans, which predominate in the affairs of major nations,

involve transfers within the economy. Debts, public and private, must be evaluated therefore on the basis of the transfers (benefits) at the time of the loan as well as on the basis of the transfers (costs) at time of payments. The essence of loans is the transfer of purchasing power from the creditor to the debtor at the time of the loan and the return of purchasing power (but not necessarily of the same real value because of fluctuations in the value of money) upon repayment.

*Data for state and local governments are for June 30 of each year.
†Comprises nonreal-estate farm debt contracted for productive purposes and owed to institutional lenders.
‡Data are for noncorporate borrowers only.
§Comprises debt incurred for commercial (nonfarm), financial and consumer purposes, including debt owed by farmers for financial and consumer purposes.
From Elwyn T. Bonnell, "Public and Private Debt in 1948," *Survey of Current Business*, p. 8 (Oct. 1949).

In the U.S. (and in many other countries) private debt was the dominant factor in the economy, until World War II lifted the volume of public loans to unprecedented peaks. From 1916 to 1943 the relative importance of private debt instruments declined but it was not until 1943 that federal securities approximated 50% of the total debt. This was caused not alone by war borrowing but by the correlative policy of minimizing the production of civilian goods and the use of capital for financing such activities. The wartime capital requirements were supplied primarily by the government itself and augmented its borrowings. The relative importance of public and private debts in the U.S. from 1916 to 1948 is shown in Table III.

Ratio between Debt and National Income.—The burden of debt is relative to national income from which interest and amortization are eventually paid. The volume of debt can be more appropriately related to national income than to national wealth or population. Per capita comparisons are of little significance because debts are not retired by poll taxes. Ratios of debts to wealth would be significant but estimates of national wealth are imperfect and cover only selected years. On the other hand, estimates of national income in the U.S. (and certain other countries) are reliable and are available for many years, especially since World War I. The ratio of the national debt and interest charges to the U.S. national income are shown in Table IV.

TABLE IV.—*Relationship of United States Public Debt and Interest Thereon to National Income: 1919–49*

Year	National income* (in millions)	Gross public debt† (in millions)	Ratio of public debt to national income*	Interest on public debt†	Ratio of interest on public debt to national income*	Computed interest charge†

†*Annual Report* and *Bulletins* of the Treasury Department.

Relation of National to State and Local Debts.—The form of political organization affects the size of national debts and their relationship to total public debts of a country. The greater the number of independent units with power to contract debts within a given country the more necessary it may be to add the debts of these units to the debt of the central government to secure a true picture of the debt situation within the country. In England local debts need only to be added to the debt of the central government. In the United States the aggregate of public indebtedness includes obligations of the federal, state, county, township, city, village and *ad hoc* units. The situation in Canada resembles that of the U.S. From Table III, above, it can be seen that for the U.S. in 1916 the amount of state-local borrowing exceeded that of the federal government. This was true throughout many years in U.S. history; but after World War I, federal borrowing became vastly more important than state-local borrowing. In 1949 state-local debts aggregated $20,875,000, of which 45.5% was owed by cities, 19.3% by states, 15.8% by special districts and 10.3% by schools. The changes that took place after 1902 are shown in Table V.

TABLE V.—*Gross Debt of Federal, State and Local Governments: Selected Years, 1902–49*

Year*	Total	Federal†	State and local		
			Total	State	Local
	Amount (millions of dollars)

*For years 1940–49, data are as of June 30; data for earlier years are as of fiscal year endings
†Excludes debt of federal agencies incurred outside of the general treasury.
Source: *Governmental Debt in 1949*, Bureau of Census.

Justifiable Occasions for Borrowing.—Classical writers on political economy justified resort to public borrowing on three occasions: (1) to meet fiscal emergencies; (2) to cover the initial cost of public works; and (3) to cover temporary deficits. The primary cause for public indebtedness throughout history has been war. The second major cause has been public works. The reflationary spending of major governments of the world during the depression of the 1930s was largely for public works. In Germany, however, the expenditures were mainly for rearmament and public works, such as roads, for strategic purposes. England, after expanding its public works program, turned in 1937 toward rearmament; the U.S. later followed, in June 1940. Local borrowings throughout the world have been mainly to acquire public works, such as streets, schools, public buildings, utility plants, etc. The fundamental purpose underlying most loans has, therefore, been the avoidance of frequent increases in current taxation. John Stuart Mill, in addition to approving the three occasions for loans enumerated above, did not regard as pernicious the borrowing of capital from abroad, or the borrowing of capital at home "which either would not have been saved at all unless this mode of investment had been open to it, or, after being saved, would have been wasted in unproductive enter-

prises, or sent to seek employment in foreign countries." (*Prin. of Pol. Econ.*, bk. v, ch. vii, §1.)

Scholars must agree with Gustav Cohn that the history of public debts has been characterized "by the progressive development of occasions and inducements to the contraction of public debts." (*The Science of Finance*, p. 682.) Even the needs of lenders were considered. Low-income groups in France needed safe investments for savings; *rentes* were offered. Public credits, often issued to help the government finance emergencies, as in the U.S. Civil War, were made the basis of commercial banking. A government loan provided the capital of the Bank of England, chartered in 1694. Government securities have also provided endowments for charitable trusts and eleemosynary institutions. When national governments, after experimenting with banking and credit mechanisms to prevent recurrent financial crises, accepted direct responsibility for the economic welfare of citizens, public borrowing assumed a new role. Intentionally unbalanced budgets became common as public expenditures to provide relief, or to offset shrinkages in individual spending, or to provide employment via public works, were covered by recurrent borrowing. The problem at such times was largely one of maintaining aggregate purchasing power within the economy. Expenditures financed by borrowing created a smaller volume of counteracting (deflationary) forces than other types of financing. Through borrowing to provide a desired level of public expenditures, the government could directly, and via secondary or multiplier effects, affect the volume of consumer spending, the level of national income and to some degree the volume of investment. Such fiscal policies follow the reasoning of J. M. Keynes in his *General Theory of Employment, Interest and Money*. Experiments in the U.S. from 1933–39 and expenditures for war 1940–45, also financed by borrowing, clearly demonstrated that the volume of production, spending, employment and flow of income can be affected by public spending supported by borrowing. The volume of effects from each dollar spent is still debated, but there is agreement among economists that the effects of initial expenditures decrease with the passage of time after expenditure.

These theories, particularly the multiplier analysis (secondary effects of expenditure), led to the formulation of a pump-priming theory under which it was held that public expenditures, particularly on public works, would generate economic recovery. A deflated economy would thus soon become self-propelling and prosperous, so that injections of purchasing power created by government borrowing would no longer be necessary. Such were not the results, however, of the relatively small U.S. spending program of the 1930 epoch. When government expenditures were reduced the volume of economic activity sagged in 1937–38. Other factors than the reduction of expenditures contributed to this slump but ability to create an economy capable of moving forward, with increased production and employment, when government-induced expenditures are curtailed remains to be demonstrated in fact, if not in theory.

The limitations of the pump-priming theory seemed to lead Alvin Hansen to the advocacy of another use for public debts. He saw in the mature economy of the 20th century declining outlets for new private investments. (See *Full Recovery or Stagnation?* and *Fiscal Policy and Business Cycles*.) This tendency, conducive to an increase in idle resources and unemployment, was to be offset by public investment covered by additions to the public debt. The factual reality of the mature economy hypothesis is doubted by many economists. It represents, however, one of the latest justifications for the expansion of public debts. It may take its place as an alternative to, or as a supplement to, theories of public works expenditures as antidepression measures.

War Borrowing.—The old Roman principle was that every war should maintain itself. The Prussians subscribed to this—witness the war indemnities imposed—but embraced as well the ancient idea of a war chest acquired by taxation, expropriation, coinage debasement or other means. Later, as wars became more costly, the treasure was supposed to be adequate for initial war expenses, to strengthen the public credit and to make possible the orderly increase of revenues. These advances were to be recouped, if possible, from the vanquished. The English and French, by way of contrast, relied heavily on loans, including fiat money, to finance wars. Neither treasures nor loans long sufficed to meet the mounting cost of wars; increased taxes soon had to be added, so that *loans and taxes* came to be the customary means of financing wars.

The first modern interallied loan was made by France to the U.S. during the Revolutionary War, amounting to $6,352,500. It was fully repaid by 1815. Great Britain made loans of £600,000 to Portugal in 1809, and £2,000,000 to Sardinia in 1855. Both were only partially repaid.

The ratio of loans to taxes became a crucial problem for finance ministers in wartime. The economic effects produced by varying the contributions from these two sources had profound effects on the economic life of the country. The greater the portion of war costs paid from taxation the better it was for the future economy of the country. The disastrous effects of financing wars by loans were learned in the U.S. from the Revolutionary War and the War of 1812, to the cost of which taxes made only a negligible contribution. In the Civil War 78% of the costs were met from loans. From 1861 to 1864 the credit of the union fell steadily, fluctuating with the vicissitudes of the army. Prices during the war practically doubled as inflationary borrowing, including the printing of money, was utilized. World War I was more creditably financed in the U.S., loans covering about two-thirds of the costs. In Great Britain 71% of total expenditures 1915–19, excluding loans to allies, were covered by loans, and 75% of war expenditures, also excluding loans to allies, were so covered. In France more than 91% of expenditures (1914–19) were from loans; in Italy 73% came from loans (1915–18); in Germany 90% of expenditures (1914–18) were financed by loans.

For an account of debts contracted by the various belligerent nations in World Wars I and II, *see* War Finance: Cost of World Wars I and II; *see* also Inter-Allied Debts.

Burden of the Debt.—Only superficial analysis leads to the conclusion that the burden of public debt is measured by interest requirements. Interest represents the cost to the government—hire for money borrowed. Interest is the minimum amount finance ministers must insert in governmental budgets to keep public loans afloat. The real burdens lie in the economic effects produced by taxes for debt service, by transfers of payments, and by the gains or losses arising from the comparative alternative uses of public and private capital. There are circumstances under which debts represent no economic burden whatever; there are other instances where society is poorer because capital, if left in private hands, would have been more effectively employed. Moreover, in discussing the burden of public debts, external and internal borrowing must be distinguished.

In the case of external loans the borrowing country receives a net addition to its capital at the time the loan is made. When interest or principal is repaid, the debtor must export gold, goods or services to the creditor country. This deprives the debtor nation of these resources, provided they are not reinvested in the debtor country. These payments may not constitute a real burden, however, for the capital initially borrowed, if put to productive use, may have developed the resources of the debtor country or may have been employed in a specific venture the operation of which yielded the returns from which both principal and interest were paid. Domestic capital was thus free to add to the development of the debtor country. The external loan not only made the debtor country better off than it was before, but the capital borrowed produced interest and its own replacement. If the funds borrowed were not productively employed, the debtor would suffer a real loss.

Instead of looking at goods and services produced or employed in payments abroad, gold was frequently the only object of attention. At the time of the loan, gold was received; at the time of payment, gold was exported. The fact that foreign loans were so often employed in wars and that shipments of gold to repay debts were a visible drain on debtor countries accounted for the early opposition of classical economists to public debts. Taxes em-

ployed in securing funds for the repayment of external loans were often burdensome per se. Their effects on incentives to produce or save were frequently negative, adding to the consequences of transfers abroad.

In the case of internal loans all payments are transfers within the country. The nation as a whole can be neither richer nor poorer. At the time of the loan, capital is either transferred from those who have previously saved it, or from those who have created it, to the use of the debtor. The question of burdens at the time of the loan is whether the transfer to the government will result in a more efficient or less efficient use of capital than if capital were left in private hands. If the use of the proceeds of loans to the government is to increase the productivity of capital, the economy of the country is better off than if capital were left in private hands. This is a question of fact rather than of theory, but unfortunately facts are seldom available for an answer.

At the time of payments, either of principal or interest, resources must be acquired by the government to discharge claims of creditors. Taxes collected to pay debts are transferred to holders of government securities. The country has neither gained nor lost as a whole, but the fortunes or distribution of income among groups within the debtor country have been affected, for seldom are bondholders paid by taxes primarily upon themselves. If bonds are paid by taxes imposed in such a way as to fall on funds which otherwise would have been spent, forced saving results, unless the bondholders, in turn, squander payments made to them. If forced saving results from tax payments and reinvestment of capital by bondholders, the net result of debt payments is an increase in the supply of capital. If taxes are paid from capital and funds are reinvested by bondholders, there is no loss of capital save to the extent that administrative costs represent diversions to consumption; but even administrators may save a portion of their incomes. If bondholders squander payments to them, capital decrements result. It is believed that owners of government bonds are more likely to reinvest than to consume the interest and capital payments received by them. This depends upon the time in the cycle, and the income groups or institutional holders to which payments are made. If payments are made to individuals during depressions, there is greater likelihood that the percentage reinvested will be smaller than during prosperity periods. There may, of course, be shifts in investments made, as from gilt-edged to speculative securities. This, too, is affected by prosperity and depression, as well as by investment fads. If, as a result of these shifts, individuals, who can ill afford to assume losses, do purchase relatively risky investments, actual losses may be accompanied by disastrous consequences to them and even to society. The concentration of such losses among low-income (or middle-income) groups tends to increase the share of wealth held by the well-to-do.

Likewise, if the rich are the primary holders of bonds while taxes to service debts are paid mainly by the less well-to-do, the concentration of wealth in the hands of the rich is increased. If fortunes composed largely of government bonds are handed from one generation to another by inheritance, such estates may be transferred with a larger pecentage intact than fortunes composed of more risky investments. The privilege of tax exemption accorded to income from certain government securities by various units will affect these tendencies. They will also be affected by the levels of progressive income taxation, including provisions for the deduction of capital losses where incentives to save, to assume risks and to hold investments may be involved. However, with advancing industrial civilization the concentration of government securities held by the rich has tended to decrease. The holdings of institutions, such as savings banks and insurance companies, in which are massed the small savings of the many, have steadily grown. This greatly complicates all generalizations as to debt burdens and effects of payments.

If internal loans are made by banks on the basis of credit created by them, a net addition to domestic investment or purchasing power results. This is inflationary unless the borrowing so scares the holders of capital or income that they reduce net investments and consumption. It also tends to free taxpayers from the payment of current taxes (to the extent of loans) if the activity financed by government would have been undertaken in any case. And, the larger the sums needed by government in a world full of wealth inequalities, the higher its tax-rate progressions would have to be. The distributional effects of taxes and debts increase with their size.

The manufacture of credit by banks for government (or private) use tends to create future difficulties both for banks and the economy as a whole. Inflationary financing tends to raise prices and interest rates; as interest rises the price of outstanding government bonds tends to fall, decreasing the value of bond portfolios and increasing the sale of bonds by private holders. This causes further declines until an equilibrium is reached. Such conditions, in the past, have produced bank failures with widespread losses; market maintenance and other countermeasures have been required, but the aftermath of credit creation has been depression, declining prices and an increase in the real burden of debt, for the charges have to be met from smaller national incomes and payments made in money of higher purchasing power.

Present *v.* Future Burdens.—The question frequently is asked as to whether it is possible to pass internal debt burdens from present to future generations. The possibility is envisaged because borrowing precedes the imposition of taxes for the payment of interest and principal. However, at the time of the loan, lenders surrender present goods and services to the borrower. Private capital is surrendered for present economic goods. Lenders, moreover, forego consumption or alternative investment of their funds; those who sell goods part with them. The goods, in turn, may be currently consumed or converted into capital assets to render service until worn out. At the time taxes are imposed to pay interest or principal, goods are transferred by present taxpayers to holders of debt instruments. Taxpayers surrender goods or forgo consumption; bondholders receive them. These are transfers within the group in existence at the time transfers are made. No transfers are made between the generations alive at the time of the loan to those at time of payment. The transfers are effected only within the groups on each separate occasion.

There are, however, circumstances when the burdens created by internal debts can be passed on to future generations: (1) when the proceeds of loans are put to unproductive use, as in a war of aggression ending in defeat, so that future generations are worse off than before; (2) when the present generation consumes its capital; (3) wastefully exploits its resources; (4) undermines the efficiency of its labour for a considerable period of time; (5) retards industrial progress; or (6) fails to maintain or replace depreciating productive plant and equipment. Thus, future generations are made poorer by the profligacy of present generations. On the other hand, wise utilization of resources by the borrowing government should increase national productivity, making it easier for future payments to be made.

The ability to shift the burden of external loans to the future rests upon analysis similar to that above, and depends largely upon the uses to which borrowed funds were put. (*See* also *Burden of the Debt,* above.)

Every loan or tax means that the possessor of resources surrendered gives up the opportunity to consume or invest funds. The real cost of loans is found not in the interest paid but in the net comparative loss, if any, in the use of funds to lenders. Presumably money would not have been loaned if alternative and more productive employment of funds had been available. Nor should government devote its resources to debt repayment if more productive uses of funds are open. The net advantage from public or private use of capital depends on comparative rates of return. The gain from capital so employed must be set against the losses resulting from taxes collected. The use of capital borrowed holds the clue to real debt burdens.

Problems of Issue.—The problems confronting finance ministers at the time of borrowing are also of a technical order. They present a mixture of economic, political and administrative questions. Decisions made at the time of issue determine, for the most part, the problems of managing the public debt, until it is extinguished. Even the time of occurrence, and periodicity, of many

problems is fixed when the terms of borrowing are decided. The problems of issue are, therefore, largely anticipatory management problems.

The main problem of issue is often said to be that of putting the debt in such form as to enable the state to borrow at the lowest effective rate. The way to achieve this is said to be by giving the investor the type of security he wants. This will facilitate sales but what the investor wants, or thinks he wants, may not be what he should have. Nor should the tastes of investors determine decisions as to the form of borrowing. Those decisions should be made in terms of policies calculated to maximize economic well-being—in terms, for example, of production, income flows or incentives to work, save and invest. Such objectives are more important than borrowing at the lowest effective interest rate. There are times when the state should pay high rates rather than the lowest rate at which it can borrow; for example, in order to mop up income or to put securities into proper hands.

Among the primary decisions to be made at the time of the loan is, from whom should the government borrow? From individuals or banks? From hoards, idle balances or from the current-income stream? Is it better to concentrate on past savings or to utilize specially created credit? The economic effects flowing from loans from different sources, tapping unlike types of capital (or credit) are various. Some borrowing is inflationary, some is not. At certain times in the economic cycle, one type will be appropriate while another may not do at all. Those in charge of the state's fiscal policy will have to decide when it is appropriate to use a given type of borrowing, as well as the amount which, under the circumstances, is justified.

Akin to this is the question as to who should own or hold government securities. Should the government try to induce subscribers to hold bonds to maturity, or should it be indifferent to sales by owners? If government bonds become a conspicuous field for speculation, what may happen to the nation's apparent credit standing if securities yielding greater returns provide the inducement to owners of government securities to sell? And, who will the new holders be? Will the government, in order to minimize losses to owners, be forced to go into the market to buy up its own securities? Or, can it rely upon the approach of maturity, or call dates, gradually to bring its issues on the market up to par, as it prepares to pay off holders at maturity should they desire it? Answers to such questions are made when the treasury decides who is to be eligible to subscribe to specific issues, and on what terms. Similar decisions are made when limitations are placed on the amount of given securities any one person may own or purchase within a definite period. When loans are oversubscribed, purchases must be allocated among subscribers. The allocations need not be purely mathematical determinations; they may be selective so as to implement policy decisions.

The usual problems confronting the state at the time of borrowing relate to the form of the loan, the type of securities to be issued, the term of years or days for which money is to be borrowed, the rate of interest, marketability, negotiability and features to promote sales. Among the "lures" or "relishes" to be considered are tax exemption, circulation privileges, prize drawings or lotteries, use of securities at par or fixed values, in payment of taxes, etc. With the development of security markets and citizens' investment habits (along with funds for investment) such features have declined in importance.

The issuance of securities at par is preferable to their sale at discount. Sale at discount is not to be confused with sale on a discount basis. In the latter case, to the issue price is added interest accumulations so that the holder receives his return through additions to principal rather than via current interest payments. (*See* also *Types of Public Debt: Interest-Bearing Debt,* above.) In the early days of public borrowing sale at discount was prevalent because the credit of states was weak and lenders could secure increased profits from loans (in the nature of underwriter's profits) without making conspicuous additions to the interest rate which opposition to usury also condemned. History is replete with examples, as in the U.S. during the Civil War, when treasuries refused to offer securities bearing as much as the market rate of interest, with the result that they could be sold only below par —or at a discount. Nevertheless, such securities had to be redeemed at par. Consequently a higher effective rate of interest was paid over the life of the loan than was called for on the face of the debt instrument. More had to be paid at maturity than was in fact received at issue. Samuel Gale, writing in 1784, said, "If the rate of interest for money should be restrained by legal provisions, or apparently disguised . . . such disguise will be attended with the loss of a *principal* proportionate to the degree in which the rate of interest shall be so disguised." Similarly when bonds are issued at interest rates above the market, a *premium* is received, based roughly on the present value of the excess interest, which is amortized over the life of the loan, the obligation being payable at par. It is hard to justify the payment of excess interest in such cases over the life of the loan. If greater sums are needed by the state, more securities should be issued at par.

With a constantly increasing U.S. public debt interest charges also mounted, in spite of any tendency for rates of interest to fall (*see* Table IV, above). This caused many government officials to be concerned over the budgeting of interest costs. As long as national incomes rise, interest requirements do not seem burdensome; but when depressions bring low-income payments, the relative weight of interest rises. It becomes harder to wring from declining incomes the taxes required to pay interest on past debts. As interest burdens rise, budget officers, too, seek to minimize the payments thus required. From fiscal officers naturally come demands that rates of interest be kept low. This desire, on the part of government, to minimize its own interest payments may be in conflict with the policies of monetary authorities, who at a given time may be increasing interest rates in order to curb inflationary credit expansion. Thus, the policies of the government as a debtor may come into conflict with policies of government to control private credit, or the level of economic activity in the nation. The two policies will not always be in conflict. At times in the cycle, easy-money (low-interest) policies will be appropriate for both the treasury and monetary authorities and for the country as a whole. In other situations advancing interest rates may be desirable.

To an increasing extent in the future, proposals to reduce interest costs on the public debt will be made. For years groups have advocated the substitution of fiat money—often called "interest-free borrowing"—for interest-bearing securities. Likewise, increased borrowing from central banks as a regular policy rather than as a temporary emergency seems to be growing in favour. During World War II the large holdings of treasury bills by the federal reserve banks in the U.S. were tantamount to direct borrowing, as, of course, was the case of advances on ways and means in England. The treasury (U.S.) sold bills to commercial banks which, in turn, sold the bulk of them to the federal reserve banks. Direct borrowing would have had the same effect and perhaps also provided savings in interest costs. Opponents to direct borrowing denominate it as inflationary, but if credit was being created to finance the government at the time, the argument loses much force. Inflation, as a monetary phenomenon, arises from the source and volume of funds rather than from the type of instrument issued as an evidence of indebtedness, although some types of securities can be more easily substituted for money than others. Proposals have also been made to require banks to finance the government *at cost* for creating credit rather than at market rates of interest. Special securities designed only for bank ownership bearing a low rate may tend to lower interest. This was the result of financing via short-term loans in both England and the U.S. after World War I. Speculation in government securities and profits from their appreciation in value tend to increase proposals to monetize public debts and otherwise to socialize public credit. The development of *rentier* classes or corporations tends to produce similar movements. Hence, modern governments desire a wide distribution of securities.

Who Holds the Debt?—During the 17th and 18th centuries when private bankers, such as the Barings, Hopes, Goldsmiths and Rothschilds were financing governments, the concentration in

debt ownership was evident. Speculation in public securities has been the source of many fortunes. The assumption of the Revolutionary War debt by the U.S. national government was opposed because it tended to enrich speculators. The financing of the Civil War "offered a rich harvest for the money lender" (H. C. Adams, *Public Debts*, p. 40). Not until comparatively modern times, and in only a few countries, are data available as to the distribution of debts. In 1880 in the U.S., when the registered debt was $1,173,749,250, foreign holdings were $27,894,350 (or 2.4%); national banks owned $319,937,800; the residuum of $825,917,100 was owned by 80,802 corporations and private individuals, no allowance being made for duplicate registrations by the same owners. The census bureau counted individual owners by size of holdings for $417,538,850 of bonds, of which 47.8% were held in amounts of more than $50,000, presumptively indicating ownership concentration in the upper-income level. Only 10.1% of the holdings were in amounts of $2,500 or less.

By 1935, although there remained a marked concentration of bond ownership among the rich, the distribution seems a priori to be more equitable than in 1880. Table VI shows the distribution of tax-exempt interest on wholly and partially tax-exempt securities (federal, state and local issues), and the distribution of ownership among income classes for 1935. This is the closest approach that can be made in the U.S. to a personal distribution of bond ownership. Unfortunately, it does not cover the holdings of those with less than $5,000 personal income. In 1935–36, however, the study of *Consumer Expenditure in the United States*, by the National Resources committee, indicated that total savings by families and single persons in income groups less than $5,000 amounted to $1,248,000,000, in comparison with $4,730,000,000 for income classes above the $5,000 level. The great increase in wages and salaries during World War II is believed to have greatly improved the lot, and, hence, the volume of saving, in income groups below $5,000. During World War II this group purchased substantial amounts of war bonds via pay-roll deductions.

In recent years there has been a growing tendency for larger fractions of the public debt to be held by institutional holders, particularly by banks, corporations and insurance companies. This complicates the problems of analysis, particularly as to who is being paid (either interest or principal) and by whom. The banks represent depositors and stockholders; insurance companies invest funds contributed by a legion of policyholders and the relatively small capital subscriptions of stockholders; savings banks invest the small surpluses of people of slender means; government trust funds invest contributions of other large groups but the composition of each group, by income classes, is unknown. That they are far-flung is common knowledge. Security ownership by institutional categories has been tabulated monthly in the U.S. since 1941. Data for selected years from 1939 to 1949, as shown in Table VII, reflect the impact of financing World War II and indicate the degree to which individuals, as well as institutions, helped to underwrite the war, and changes which have since taken place.

Comparable information as to the ownership of national debts is not available for other countries. Harold Seligman, however, worked out a distribution on the basis of the increase in debt, 1940–44, for the U.S., U.K. and Canada, as shown in Table VIII, which indicates the preponderant reliance on individual ("other") subscriptions in the U.K. and Canada and the slightly greater dependence on banks in the U.S. compared with Canada. Ownership distributions by income classes are unavailable in the U.K. and Canada.

Problems of Debt Management.—Debt management is concerned with problems arising from the time of issue through the payment of debt obligations, such as, (1) the redemption or funding of nonmarketable issues; (2) the funding or refunding of short-term issues; (3) the discharge or refunding of interfund borrowings; (4) maintaining the market, to promote stability of prices; (5) meeting maturity schedules; (6) covering interest costs or effecting reductions therein; and (7) repayment of the debt. These problems are also of a technical nature. Some arise inevitably as debt matures; others, particularly as complications arise, are created by uncertain economic events in an unpredicta-

*United States savings bonds, Series A-D, E and F, are included at current redemption values.
†Securities issued or guaranteed by the U.S. government, excluding guaranteed securities held by the treasury.
‡Consists of commercial banks, trust companies and stock savings banks in the United States and in territories and insular possessions. Figures exclude securities held in trust departments.
§Includes partnerships and personal trust accounts.
‖Includes savings and loan associations, dealers and brokers, and investments of foreign balances and international accounts in the U.S. Beginning with Dec. 1946, includes investments by the International Bank for Reconstruction and Development and International Monetary fund in special noninterest-bearing notes issued by the U.S. government.
¶Holdings by federal land banks are included under "other corporations and associations" instead of "U.S. government investment accounts" beginning with June 30, 1947, since the proprietary interest of the United States in these banks ended June 26, 1947.
♀Consists of trust, sinking and investment funds of state and local governments and their agencies, and territories and insular possessions.
Data taken from *Treasury Bulletin, November 1949*, p. 31.

ble future. Competent debt management must meet all conditions and use management policies, like taxation, borrowing and expenditure as an instrument of fiscal policy.

When the government agrees to redeem nonmarketable debt, it must do so when called upon and at prices fixed in the loan contract, if its credit standing is to be maintained. Such securities, when eligible for redemption, become, for practical purposes, demand paper. The government can secure funds for redemption via taxes or by new loans. In the latter case, what is involved is a substitution of creditors. The volume of redemptions is affected both by the credit standing of the borrowing government and the cash requirements of the creditor. At maturity, nonmarketable debts present the same problems as other debts—payment or extension.

Ability to manage short-term debt is both a test of over-all debt policy and of efficiency of debt administration. Instead of being an instrument of emergency finance confined to periods of monetary crisis when even circulation needs can be met, short-terms have become the conspicuous feature of U.S. and U.K. finance. Keeping them afloat involves the almost constant task of renewal; it keeps the government regularly in the money market, in close touch with commercial and central banks. If the credit of the government wanes, or if interest rates change, it becomes quickly visible in the short-term market. The traditional objection to the liberal use of short-terms has been this very dependence on the money market for renewal. In times of crises it was feared that renewals would be difficult or even impossible to obtain or available only at prohibitive rates. Modern governments have met such criticism by increasing the size of working-cash balances, by anticipating borrowing requirements for longer periods, even though slight increases in interest were involved, and by combining short-terms with borrowings on longer maturities. A further traditional objection has been that short-terms were inflationary. However, it is not the form of the security which creates inflation but the source and volume of borrowing. If borrowing is on the basis of manufactured credit, long-terms, short-terms and other issues will be inflationary; if borrowings are from current incomes, the particular security offered cannot *at that time* make the transaction inflationary.

When these objections are not sufficient deterrents, the frequency of renewal is supposed to be conclusive. Such work is one reason, however, why administrators are hired. So long as financial institutions can absorb short-terms they will desire them in cyclically differing volumes; so long as governments can borrow upon them at lower effective rates than other securities they will be offered. Governments can be expected to utilize short-terms in the future in greater relative volume than in years prior to World War II.

On occasions of credit stringency, or at times when the market is propitious, governments may be expected to fund short-terms into longer maturities. Likewise, maturing long-terms may be exchanged for short-terms when such switches facilitate later refunding, or when market conditions justify increases in short-term borrowing. If debt is to be reduced, short-terms may be paid off first since recurrent maturities make this easy for the government to accomplish, as was the case in the U.S. between 1920 and 1930. But what securities, and whose, should be retired at any given time depend on the monetary and economic effects produced by repayment.

Interfund borrowings, to the degree utilized, free the government from recourse to the money market. The loans may, however, carry market rates of interest. If the rates are above market, the borrowing fund subsidizes the creditor fund; if the rates are below market, the debtor fund secures the advantage. One fund cannot loan to another unless it has a temporary surplus of cash. The interfund operations will fail, too, over the long run unless the debtor fund repays the creditor by the time cash is needed to meet current obligations. The management problem of the debtor, fundamentally, is that of meeting the cash requirements of creditor funds. To do this the debtor may need to resort to temporary borrowing in the market or secure revenue receipts by the time required. No fund should be plundered or robbed of cash for the sake of another.

Often a government is called upon to take steps to keep the market price of its securities from falling below par. The practice is more common in the U.S. than in England where temporary fluctuations in price are not regarded as a government responsibility. Not only has the U.S. government, through the open market committee of the federal reserve banks, tended to keep the price of its securities from falling below certain points but the committee has also sold securities to retard their advance in price and to check speculation. Three motives operate to foster price maintenance arrangements: (1) the desire to minimize losses to small investors; (2) the desire to minimize losses to financial institutions, particularly banks; and (3) the desire to implement monetary or fiscal policy. The sales of the open market committee reduce the reserves of member commercial banks; purchases provide reserves to the banking system. Sales help keep down the price of governments; purchases tend to bolster the market. Of course, it may be argued that purchasers of government securities have been paid interest which includes a premium for risks assumed. If purchasers buy short-terms the brief maturity protects them from capital losses caused by fluctuations in price. Consequently, rates are low. Long-terms are exposed to all market forces during their life; therefore, interest rates are higher. Maintaining the market for long-terms tends to make them almost as riskless as short-terms, both being equally liquid in an active, available market. Such a price-pegging policy tends to increase the worth, in the market, of long-terms, rewarding present holders, but not the government, if the policy was settled upon after issue. Hence, apart from considerations urgent in monetary policy, the government may not have an economic interest in decreasing price fluctuations in its outstanding securities. If price changes depreciate the assets of the banking system, for example, its interest may become vital. The forces on each side of the market-maintenance controversy need to be weighed carefully. Answers cannot be categorical.

Meeting of maturity schedules is perhaps the most important task of debt management. At maturity, debts either have to be paid or extended. In case the obligation is renewed, the operation is one of refunding. Such extensions tend to maintain the credit standing of the state because they not only pay off those who want cash but adjust the new offerings to the requirements of the security market. Refunding operations are therefore timed, where possible, to market conditions propitious for renewal. The permanent loans (consols) of the British avoid these renewal problems. They carry no definite date of payment but the exchequer is free to pay them when convenient. From the standpoint of the treasury, consols are superior to term issues. Subscribers may not like them so well, for the government may redeem them at a time when investors find it difficult to reinvest funds, but such preferences are often imaginary.

Frequently, long-term securities are issued with a "call" privilege. That gives the government the right to pay off issues prior to maturity. For example, the $2\frac{7}{8}\%$ bonds issued by the U.S. on March 15, 1935, were made payable on March 15, 1960, but subject to call for redemption on March 15, 1955. Any time between March 15, 1955, and March 15, 1960, these bonds could be paid upon notice to holders, or could be refunded or converted. The refunding operation has been described.

Conversion refers to an extension of debt under an agreement to exchange a security bearing a given rate of interest for one carrying a lower rate. Conversions are designed, therefore, to give the state the advantage of declines in market rates of interest. If holders do not care to accept new securities, they are usually paid off in cash. In the early days some conversions were compulsory; in modern times exchanges have generally been voluntary. The earliest English conversion was engineered by Sir Robert Walpole but carried out by James Stanhope in 1717, other notable conversions were those of Henry Pelham (1750), Nicholas Vansittart (1818 and 1822), F. J. Robinson (1824), Henry Goulburn (1830 and 1844), William Gladstone (1853) and George Goschen (1888). After World War I numerous conversions were effected to take advantage of declines in interest rates,

as, for example, the British conversion of 1932 and U.S. conversions of the First and Fourth Liberty Loans in 1934 and 1935.

The payment of interest without deviation from the terms of the loan contract assures the government a ready market for future issues appropriately priced and is the cardinal feature of excellent credit standing. The meeting of interest payments with fidelity is both a budgetary and a management task. Ordinarily, interest payments will be appropriated from tax receipts. On occasion it may be necessary to cover them by temporary borrowing although a continuation of that practice for long periods inevitably leads to a deterioration of credit as well as a decline in the quality of the financial management of the state itself. Debt administrators naturally desire to keep interest costs at a minimum (see *Problems of Issue,* above), which cannot be done by refusing to pay the market rate for funds. The state, however, should take advantage of opportunities by refunding and conversion to keep its securities in line with market rates of interest; when necessary to adjust interest rates on public securities, it should do so in a forthright manner. Unilateral adjustments—changes in debt contracts promulgated by the state without consent of creditors—are generally opposed. (See *Problems Created by Price Level Changes,* below.)

Repayment of Principal.—The repayment of national debts has long been the central problem of management and a chief concern of scholars. Classical economists looked at national debts as though they were personal obligations, to be repaid at the earliest opportunity. Unless debts were promptly repaid, some future emergency might arise when the borrowing power was exhausted. Furthermore, continuously mounting interest costs could only bring an increase of taxes; there might be also interferences with expenditure programs. Then, too, it was felt that mounting debts would progressively undermine the monetary system, especially if difficulties were encountered in meeting contractual payments. Finally, repayment was regarded as the means through which credit standing was maintained. More recently other aspects of management—fidelity of interest payments, refunding and conversion—are seen to be of equal importance.

Opposition to debt repayment has taken three forms: (1) objection to reduction of principal; (2) postponement of payment in order to discover, or utilize, means whereby burdens of retirement could be reduced; (3) opposition to the imposition of sufficient taxes to reduce debt. Procrastination in repayment, accompanied by the gradual depreciation of the purchasing power of money through rising prices has played into the hands of opponents of debt reduction. It has been argued that if the same efforts devoted to debt payment were turned to increasing production and the development of natural resources, the burden of debt would be reduced and its eventual payment more easily effected. Such a program would also avoid dislocations of industry and the reduction of consumption and investment following heavy taxation for debt retirement. At times it has been pointed out that there are better uses for public and private dollars than the reduction of national debts.

Payment has also been opposed on the ground that certain institutions and individuals need public securities. They have furnished part of the foundation for commercial banking; they have provided socially desirable institutions (charities, schools, hospitals, etc.) with certain income from endowments; they have given low-income groups a safe place to invest savings. Although these uses for government securities would be ended if the national debt were paid off in its entirety, much reduction is possible before the above uses are impinged.

In the case of an internal debt it has been argued that since "we owe it to ourselves," repayment is unimportant. What is taken away in taxes to repay the debt is returned to holders of debt tickets, administrative expenses of taxes and loans being ignored. While the aggregate transfers do not change national income, the distribution of resources among income-groups within the country is affected, for the holders of debt and taxpayers who pay them are not identical. Certainly the realization that payments of internal debts are only transfers should dispose of the argument that debt repayment is desirable *per se.* Internal debts should be retired when beneficial economic effects for the whole group are to be realized. When other uses of funds are more important, a less important use, such as debt retirement, has little claim for attention. The larger the debt the more serious are the economic consequences of transfers. These effects provide the answer to the wisdom or folly of debt retirement.

In the case of external debts, payments to creditors involve the transfer of gold, goods or services abroad. The debtor country loses the use of whatever is shipped outside of its economy. A desire to cut off these losses as promptly as possible argues in favour of speedy retirement of foreign debts. Without bothering to distinguish between internal and external debt, many writers have applied their arguments to debts of all varieties.

F. W. Pethick-Lawrence (*The National Debt* [published by The Labour Publishing Co., Ltd.], p. 26) has pointed out nine ways in which a national debt can be reduced or extinguished:

"(1) The debt may be redeemed. (2) The debtor and the creditor may become the same person. (3) The creditor may cease to exist (4) The debtor may cease to exist. (5) The creditor may forgive the debt. (6) The debtor may refuse to acknowledge the debt, in whole or in part, and compel the creditor to accept the situation. (7) The debtor may become bankrupt. (8) The debtor and creditor may come to a mutual agreement to commute the debt into a different form. (9) The debt, while nominally remaining intact, may in effect be reduced, and even practically extinguished, by altering the standard of value in terms of which it is measured."

The methods by which a nation may pay its debt to an existing creditor may be divided into three general groups: (1) nonrecurrent opportunities for debt reduction, such as the sale of public property or a capital levy; (2) periodic or almost automatic retirements; and (3) retirements made to implement a cyclical fiscal policy. The last two groups are most important, both from the standpoint of use and theory.

The periodic or regular reduction plans include the dedication of yields from designated taxes or other revenues to debt payment, the creation of sinking funds and retirement via the issuance of annuities. The partial repayment of loans of World War I by their allies to the U.S. and U.K. may be included in this category.

The repayment of loans by the use of tax receipts pledged therefore has long been prevalent in international finance. It was an almost certain method by which foreign bankers could extract payments from weak or newly established governments. The familiar dedication of the salt tax revenues of China to the payment of foreign loans is a case in point. Internal loans have been similarly retired. Special property-tax levies have discharged most municipal debts in the U.S. Franchise taxes on federal reserve banks were devoted to the retirement of the U.S. national debt from 1918 to 1933. Gladstone and others have favoured the dedication of death tax receipts to debt reduction. The use of other specific taxes has been championed.

By far the most important method of debt reduction, historically and from the standpoint of the volume of scholarly output, has been from the creation and use of sinking funds. The essence of a sinking fund is the incorporation in the spending program (budget) of a regular appropriation for debt retirement to be covered by available revenues. In early years the miracles of compound interest caused sinking funds to be invested and held pending the maturity of the obligation, at which time the fund would be sufficient mathematically to retire the issue. Richard Price (1771), regarded as the classical progenitor of the sinking fund, believed that it should be set up from revenues; if these were insufficient, it would pay to borrow to make sinking fund payments, for that fund would accumulate at compound interest whereas the debt would draw only simple interest. Robert Hamilton (1813) completely punctured this illusion, establishing the valid point that the only true sinking fund, or effective method of debt reduction, is a surplus of revenues over expenditures.

The experience of English and U.S. governments with sinking funds is long and notable—famous, for the most part, because debt reduction as planned was not achieved. Walpole established the first sinking fund in 1716 but it was violated by diversions to other objects of expenditure. William Pitt based his

experiment of 1786 on Richard Price's theory, even to the extent of borrowing to maintain it. Some modifications were made in it in 1792, 1798 and 1802. In 1813 Vansittart revised it further to discharge the old debt of 1786 and to apply it to new loans. In 1817 the sinking fund of Ireland was consolidated with that of Great Britain. In 1821 David Ricardo criticized the fund; Lord Grenville added an essay of criticism in 1827, with the result that reforms were again instituted in 1828. It appeared that more than twice as much debt had been accumulated as had been retired.

In the U.S. sinking funds have also been the chief means for reducing the national debt. The first sinking fund, sponsored by Alexander Hamilton, was created in 1790. The revenues set up for it were receipts from tonnage dues and the proceeds of a loan. In spite of the failures of this sinking fund, congress created another in 1817 to discharge the debts of the War of 1812. A specific appropriation was made to the fund, and surplus revenues as well were provided. By 1835 the national debt was extinguished. A sinking fund for Civil War debts was established in 1862 but was inoperative until 1866. It was augmented by surpluses and led to the steady reduction of debt until 1893. A sinking fund was also created in 1919 for debts of World War I and became operative in (fiscal) 1921. From (fiscal) 1921 to 1943 debt retirements from this sinking fund amounted to $6,214,685,000 out of aggregate retirements of $11,594,000,000. In 1943 the U.S. sinking fund became inoperative.

An objection to the sinking fund technique is that it tends to provide a minimum of retirement. When debt is being increased, simultaneous retirement only augments total borrowing. When taxes should be increased to provide a maximum of debt retirement, it is often pointed out that the sinking fund will retire the debt within a given period, or that provision has been made so to retire it, with the result that taxes are decreased and debt retirement is thereby minimized. Such was the result of the policies of the U.S. during the boom period 1921–29. The net result, over the course of the trade cycle, is that too little debt is paid off.

The history of attempts to retire debts has vindicated the scholar's assertion that a surplus of revenue is the *sine qua non* of debt reduction. This has caused many writers to advocate debt redemption by the application of surpluses; but unless a surplus is budgeted for debt retirement the reduction achieved is apt to be small. Casual surpluses cannot be depended upon for substantial retirements. The use of surpluses for debt reduction will, however, provide cyclical retirements, for surpluses are seldom achieved during depressions. Those who favour cyclical retirements usually advocate retirements during prosperity and booms, with debt expansion taking place during depressions. It is also possible to achieve a cyclical policy by imposing taxes for debt reduction during prosperity, but with the actual repayments being delayed until subsequent depressions appear. An intentionally realized surplus provides all of the advantages of a fixed provision for redemption with none of the embarrassments or moral hazards of rigid policies or accumulating funds. It gives the government flexibility but makes it squarely responsible for debt retirement.

Problems Created by Price Level Changes.—Changes in the general price level either decrease or make more severe the burden of taxes for the payment of public debts. Decreases in the value of money ease burdens upon debtors but return to creditors less than they transferred to debtors at the inception of the loan. Falling prices may carry with them the tax base so that nations, being unable to meet their contractual obligations, default upon loans. If this condition continues, unilateral adjustments of the loan contract may be the course of relief selected by the state. It may take the form of a compulsory reduction of interest, as in the southern Confederacy in 1862, or in Australia (1931) and Argentina (1933); or a forced conversion, as in Belgium (1926) and New Zealand (1933); or an extension of the term of the loan, even to the extent of changing short- into long-term debt as was done in Italy in 1926; or of a devaluation of currency and the repeal of the "gold clause" relative to payments as in the U.S. in 1933; or the adjustment may take the form of an outright reduction of principal as in Turkey in 1881. Payment in other than stipulated media of exchange also took place in Russia in 1839 and in Germany and France after World War I. The extremities resulting from economic depression, and the alternatives available for avoiding them should be carefully weighed in appraising such actions. In terms of equity the question is whether justice to the debtor is to be preferred to benefits to the creditor. Many actions can be explained by attempts to balance these equities. The shifting of debt burdens is one of the penalties of a fluctuating price level.

Repudiation.—On rare occasions states have decided not to honour debt obligations. Repudiations are unlike defaults. When a nation defaults, it is temporarily unable to pay its debts; when it repudiates, it is unwilling to honour its obligations. Extreme depression may cause a nation in default to repudiate its debts. The usual cause of repudiation, however, is political rather than economic. The state contracting the loan may no longer exist and the new government may not care to assume the debts of the old, as in Spain (1823), Portugal (1832) and Mexico (1867). When revolts are quelled, the debts of rebellious groups are usually outlawed. After the Civil War, the U.S. constitution was amended (1868) to declare void the debts of the Confederacy. The total repudiation, scaling of principal and accrued interest on the scaled debt not paid amounted to $116,308,000 for eight of the southern states. The largest repudiation on record, however, is that of Russia, which in 1918, renounced the $19,000,000,000 debt of the tsarist regime; but the U.S.S.R. later scrupulously observed all of its own obligations. Repudiations frequently are said to cause difficulties in the floating of future loans, or an increase in the rate of interest. On the other hand, instances are numerous where the state has quickly restored its credit standing and its ability to borrow at market rates. That repudiations are rare is testimony to the extent to which the institution of public borrowing has progressed. It is part of the moral code of nations that their debt contracts, internal as well as external, be faithfully observed.

NATIONAL DEPOSIT FRIENDLY SOCIETY: *see* FRIENDLY SOCIETIES.

NATIONAL FINANCE: *see* FINANCE.

NATIONAL GEOGRAPHIC SOCIETY, a U.S. scientific society founded in Washington, D.C., in 1888, "for the increase and diffusion of geographic knowledge." Its membership in 1951 was approximately 1,965,000.

In the field of research it sent expeditions to many parts of the world, some wholly financed by it, others in collaboration with other institutions and organizations. The expeditions it sent out to study the processes of volcanism and seismology, including studies at Mont Pelée, Messina, Mt. Katmai and the Pavlof area brought new light on these earth processes and resulted in the discovery of the Valley of Ten Thousand Smokes in Alaska, a great pregeyser land which was established as a national monument by proclamation of the U.S. president. In tracing the ancient civilizations of the new world, the society, in conjunction with Yale university, unearthed the ancient Inca retreat, Machu Picchu, in Peru, and in a series of eight expeditions unearthed the even more ancient community of Pueblo Bonito, N.M., and laid the foundations for the co-ordination of the tree-ring calendar with our own and the establishment therefrom of an American chronology antedating the discovery of America by many centuries. In 1949 the society, in co-operation with the Palomar observatory of the California Institute of Technology, began a comprehensive survey of the sky with the 48-in. Schmidt wide-angle phototelescope on Palomar mountain. By 1951, 1,000 new clusters of nebulae—the farthest 350,000,000 light-years distant in space—had been discovered and recorded for the first time.

In the field of spreading geographic knowledge, the society publishes the *National Geographic Magazine*, which every member receives, issues a bulletin service for the daily press of the world, furnishes the schools of the United States with material for current-event geography and pictorial geography text in loose-leaf form. It also issues scientific monographs and publishes a widely distributed series of maps. (G. GR.; X.)

NATIONAL GUARD is the name applied in the United States to a volunteer organization of citizen soldiers who devote part of their time each week to train as members of military units. These units are organized under the same standards of equipment and personnel as are the regular army and air force units and are an integral part of the U.S. military forces. The national guard comprises more than 5,500 federally recognized army and air units established in more than 2,000 communities in the 48 states, Alaska, Hawaii, Puerto Rico and the District of Columbia. Guard units are part of the internal military apparatus of the several states and territories and under command of their chief executives. Simultaneously, all federally recognized guard units are part of the national guard of the United States, a federal force equipped by and trained under the direct supervision of the regular army and air force. The two organizations actually are identical in personnel, organization and equipment. In time of war or national emergency, however, the national guard of the U.S. may be ordered to active military service. Such units lose their state control and are absorbed into the regular active military forces for the period of active service. An outgrowth of the early militia concept, the national guard has the longest continuous history of any military organization in the U.S. The oldest guard unit in continental U.S. is the 182nd infantry of Massachusetts, originally organized as the Middlesex county militia regiment in 1636. Known as the Old North regiment, it responded to the call at Lexington and Concord, where the American tradition of citizen-soldier "Minutemen" was born. The 295th infantry of Puerto Rico traces its ancestry to the militia organized there in 1510 under the command of Juan Ponce de León. Authority for the establishment of the national guard was written into the constitution. The name "national guard" was first used in 1824 by New York units in honour of the Marquis de Lafayette, first commandant of the famed French *garde nationale*. By 1896 most states had adopted this title.

Militias, raised by the several colonies for local and self-protection, were formally organized into the over-all defense force of the country in 1775 by the committee of safety of the Second Continental Congress. They provided approximately 165,000 of the 396,000 troops raised for Gen. George Washington's command. The right and privilege of the early settlers to form these local protective organizations were recognized in the constitution of the new nation. Provision for and recognition of the militia was given in the first and second amendments in the Bill of Rights, and in the Federal Militia act of May 8, 1792. The federal government was to organize and arm "a well-regulated militia," and the states were to provide officers and control.

The constitution gave congress the power to raise and support armies, and President Washington constantly pressed congress to prepare "a uniform and well-digested plan" for the militia. No action was taken, however, and troops were separately formed and trained by each state entirely under state control. Spoken of as the "uniformed" militia, these local volunteer units were not only utilized by the states for local emergencies but also in answer to federal calls on the states to furnish forces for service elsewhere. They furnished the major manpower of the northern response to President Lincoln's first proclamation of April 15, 1861.

Congress (act of Feb. 28, 1795) gave the president authority to call out the militia in cases of invasion and other emergency, but it was dependent upon the individual governor's acceptance or rejection of the president's request.

In 1808, legislation provided for specific federal aid to be paid annually to the states to support their forces which still remained under state control. But throughout the 19th century, the national guard remained a generally unwieldy, sprawling force despite local pride and traditions and increasing federal aid. Then, in 1903, came a sweeping change. Elihu Root, secretary of war after the Spanish-American War, instituted a general program to reorganize the military establishment. A part of his program emerged as the Dick act of Jan. 21, 1903. It provided the national guard with both state and federal support. The states were assigned the responsibility of furnishing personnel and armoury facilities. The federal government became responsible for training, equipping and paying the men. Included were definite training programs, periodic inspections by regular officers detailed by the secretary of war and joint participation with the regular army in manoeuvres. The national guard developed into well-organized and adequately trained regiments.

Under the National Defense act of June 3, 1916, the organized militia was officially re-established as the national guard and made to conform to regular army organization. It became a component part of the organized peace establishment. Although largely federal in method and training, in law it remained local until actually called into federal service. Approximately 100,000 guardsmen were called into federal service in 1916 and served six months on the Mexican border. When war was declared against Germany in April 1917, the guard had a strength of 7,612 officers and 174,008 enlisted men. During 1917–18, it contributed 380,000 men in units to the army. The 11 guard divisions that saw combat made up two-fifths of the divisions in the American Expeditionary force. Of the eight U.S. divisions listed by the German supreme command as superior or excellent, six were guard divisions.

The general disintegration that followed the widespread eagerness for demobilization after World War I made it necessary to rebuild the defense force. The act of June 4, 1920, (amendments to the National Defense act of 1916), created a completely new military policy for the U.S. It established an "army of the United States" with the regular army, the national guard and the organized reserve corps as the three basic components. The national guard remained a state force under command of state authorities, except when in actual federal service. Federal assistance was expanded. When units reached certain minimum standards in strength, equipment and skill, they were recognized for federal support.

The act of June 15, 1933, created a new component of the army, the national guard of the United States. Identical in personnel and organization to the national guard of the several states, it nevertheless was a separate entity. It was a component of the army at all times, while the national guard of the several states were components of the army only when in the active military service of the U.S. The guard's federal mission was formalized and could be ordered into active military service whenever congress declared a national emergency without the necessity of being called through the governors of the several states. During the first four years after World War I, the national guard reorganized in the states at the rate of about 40,000 men a year. For economy, however, it was not allowed to attain its target strength of 435,000, but was held down and stabilized at about 185,000. Then, under the impetus of Adolf Hitler's threat to world peace, the ceiling was raised. New units were created and enlistments increased.

In Aug. 1940, the president ordered the national guard into active military service. Induction began Sept. 16, 1940, and was completed Oct. 6, 1941. About 300,000 men were brought into federal service in 18 combat divisions and numerous separate units, including 29 air observation squadrons. These troops immediately doubled the strength of the army. Guardsmen supplied trained leadership for the expanding army, and 75,000 enlisted guardsmen later became commissioned officers. Nine divisions fought in Europe, nine in the Pacific. Guard units participated in 34 separate campaigns and 7 assault landings, received 88 presidential citations for outstanding performance of duty in action, conspicuous valour or heroism.

When, after World War II, the guard was demobilized and returned directly to civilian life, there actually was no national guard for a short period. Then a joint committee of the war department general staff drew up policies for the postwar national guard, which were approved by the secretary of war on Oct. 14, 1945. The guard, under an entirely new conception, was established as a "Mobilization day" (M-day) force, an integral part and first-line component of the national military establishment. Its expanded mission was to provide a reserve component of the army and the air force capable of immediate expansion, trained and equipped to defend the U.S. at home and abroad against an aggressor. It could be called into federal service when a state of national emergency is declared by the president or congress.

Authorized strength of the national guard was set at 695,000 men (635,000 army and 60,000 air). The first postwar unit—the 120th fighter squadron of Colorado—was federally recognized on June 30, 1946. By 1950 budgets had been provided for an actual strength of approximately 350,000 army and 50,000 air. The guard troop basis included 25 infantry divisions, 2 armoured divisions, 20 infantry regimental combat teams, 97 anti-aircraft battalions, numerous supporting units and 514 air units, including 84 tactical squadrons. Strength within individual states was mainly prorated on a population basis. An annual minimum of 48 armoury drills was required, each including at least 2 hours of training, plus 15 days of full-time field training.

During the Korean emergency, more than 2,000 army and air guard units, including 8 infantry divisions and 66 tactical air squadrons, and about 150,000 men were called to active military service.

NATIONAL INCOME. National income is the net product of the economic activity of individuals, firms and institutions that comprise a nation. During any year, economic activity yields a huge total of diverse commodities and services, some of which (raw materials, semifabricates, machinery and structures, services rendered by one firm to another) are consumed in the process of production. The net product or national income is the sum of commodities and services produced minus the amounts consumed in the production process. Measurement is ordinarily in terms of money since prices are the only commonly available yardstick for the wide variety of commodities and services.

Unless laboriously constructed part by part, national-income measures are neither reliable nor useful. Only in such a way can large errors in the totals be guarded against. Only in such a way, too, can a useful picture be secured of the origin of income in various industries; the distribution of income flows by type (wages, salaries, dividends and others); the apportionment among various population groups and the division between consumption and investment, or spending and saving. Statistical data needed for detailed estimates were still lacking for many countries at mid-20th century. Even in countries with abundant information (*e.g.*, the United States, the United Kingdom, Sweden) important branches of economic activity could be only crudely approximated, and some types of apportionment could not be made on a continuous annual basis.

International Differences in Income Per Capita.—An attempt to give a picture of national-income levels and distributions must employ rough estimates for many countries with inadequate data. Yet countries can be grouped by the level of their national income per capita, measured in units of comparable purchasing power, for the period intervening between World Wars I and II. In this classification, among the countries with highest income per capita, are the United States, the United Kingdom, Canada, New Zealand, Australia and Switzerland. This group has between 9% and 10% of the world's population and accounts for a little more than 40% of total world income. Countries with lowest income per capita are India and Pakistan; Netherlands Indies; China; the rest of Asia, excluding Japan (prior to World War II) and Asiatic U.S.S.R.; Africa, excepting South Africa; Latin America, excepting Argentina, Uruguay, Chile, Brazil and Mexico; Oceania, excepting Australia and New Zealand. This group has almost 60% of the world's population, and accounts for only 16% of total world income.

The group between the two extremes may be subdivided further into an upper middle group, including all countries of western and central Europe not already in the upper group and the more prosperous countries of Latin America (Argentina, Uruguay, Chile); and a lower middle group including all countries of eastern Europe, the Balkans, South Africa, Brazil, Mexico and Japan. Some of the relatively developed units in Asia and Africa (*e.g.*, Turkey, Syria, Israel, Egypt, Morocco, Tunis) may properly belong to this group. The upper middle group, with roughly 10% of the world's population, accounts for about 22% of world income; the lower middle group, with 22% of the world's population, accounts for about 21% of world income.

These rough quantitative estimates confirm the common impression of the contrasts between various parts of the world in the level of material well-being assured them by their economic activity. What is, perhaps, less widely realized is the limited magnitude of the proportion of the world's population that has succeeded in getting a material return at all approximating that of western Europe and North America—at most about one-fifth, if we combine the upper and upper middle groups.

Industrial Structure.—In general, a high national income per capita is associated with a relatively small share originating in agricultural and other primary industries (fishing, forestry) and a relatively large share originating in service industries (professional, governmental, educational, personal). Conversely, in countries with low national income per capita, the main sources of national income are agriculture and other primary industries; and relatively small shares originate in other activities—manufacturing and construction, transportation and trade and particularly the service industries.

This association is most readily illustrated by the distribution of the working force among industries. But the distribution tends to overstate the share of the primary industries and understate the share of the service industries in national income because income produced per agricultural worker is generally much lower, and income produced per worker in service industries much higher, than the national average. In the United States the proportion of

the working force (employees and entrepreneurs) engaged in agriculture between World Wars I and II was less than 20%; in Great Britain 6%–7%; in Bulgaria 67% and in India 62%. The proportions engaged in the service industries were 25% in the United States and 24% in Great Britain, but only 7% in Bulgaria and 12% in India.

It would be an oversimplification to say that because a large proportion of a country's working force is engaged in agriculture, its national income per capita is low. Certain conditions—poverty of industrial resources, low state of education and technical training, insufficient accumulation of industrial capital, a social system unfavourable to intensive economic activity and the like—make for a low national income per capita and most of the working force must engage in agriculture in order to produce the prime necessities of life. And because under such conditions agricultural productivity is low, only a small proportion of the labour force is free to engage in other industries. Conversely, in the more advanced countries, with high agricultural productivity, sufficient farm products can be produced by such a small working force that most of the working force is free to engage in other pursuits. Likewise, in the industrially advanced countries, the large proportion of the working force engaged in service industries is more an effect than a cause of the higher income per capita: this high level causes a shift in the structure of consumers' demand toward services; at the same time high efficiency in the commodity-producing and -handling industries leaves a substantial proportion of the working force free to engage in service pursuits.

Distribution by Type.—Data on distribution of national income by type are available for only a few countries. They reflect differences in economic organization (relative importance of unincorporated enterprises *v.* corporations) and in the relative abundance of capital, whether invested at home or abroad.

In the United States and the United Kingdom, the shares in national income of compensation of employees are roughly about the same, constituting about two-thirds. The share of individual entrepreneurs, whether farmers or urban business and professional people, is low in the United Kingdom (10%), largely because of the low share of agriculture and hence of farmers, and high in such a country as Germany prior to World War II (25%), mainly because of the large role of individual firms in urban industries. It follows that the share of capital (the total of dividends, interest, rents, undistributed profits of private or public corporations) is greatest in the United Kingdom (23%); smallest in prewar Germany (10%); and between the two in the United States (18%).

From these data one could infer the character of the distributions that might be found in other countries. In general, the greater the role of agriculture and the less developed the corporate organization of urban industries, the greater the proportion of income of individual entrepreneurs and the smaller that of compensation of employees and of returns to capital. In general, the less advanced the economy of the country and consequently the smaller its accumulated capital proportionately to working force, the smaller the shares of returns to capital and the greater the share of returns for personal effort; *i.e.*, to the working population, whether employees or entrepreneurs. However, this latter generalization should be qualified because the high price of capital in the less-advanced and hence capital-scarcity countries may serve to raise the share of returns to capital.

Distribution by Size.—The distribution by type just discussed is important in determining the distribution by size. The large incomes are usually derived either from capital investments alone or from a combination of large capital investments with some returns for personal effort. And returns on capital, particularly dividends, are received mostly by the upper-income groups. The larger the proportion of returns on capital, the greater the numerically measured inequality in the distribution of income by size—the greater the difference between the low incomes received by the many, on one hand, and the large incomes received by the few, on the other.

Available data indicate wide disparities in size of income received by various classes in the population. Thus, in the United States, the top 5% of the population received, during 1919–38, about 30% of total income of all individuals. While the share of upper income groups declined during World War II and the years following, it was still close to 20% in 1947.

Income, if averaged over a few years to eliminate transient changes, tends to be more equally distributed among recipients in agricultural than in urban industries; in rural than in urban areas; in smaller cities than in large urban centres and, as already mentioned, in the distribution of incomes for personal effort than in that of property incomes. It follows that absolute and relative inequality in distribution of income may be greater in the industrially advanced countries of the world than in those with a less-developed economy.

The interpretation of these generalizations is subject to many qualifications and is beset with pitfalls. In the form in which the distributions are ordinarily given, of income among recipients for a given year, some incomes are depressed and others raised by purely transient and accidental characteristics of the single year; and hence the data overestimate inequality in distribution by income status; *i.e.*, by income levels characteristic of fairly long periods. Furthermore, the effect of graduated income taxes on amount of income disposable after taxes is often not measured. On the other hand, with data relating to income recipients, the unemployed are neglected (in some years a large group with zero incomes). Finally, in comparisons among countries, numerical measures of relative inequality neglect the absolute size of income and hence the implicit inequality in welfare and the standard of living. In the less-advanced countries, with their low average income per capita, a difference between an income that is only half the national average and one that is twice the average may mean a difference between starvation and a level of living that while adequate is perhaps lower than that of the lower-income-receiving masses of population in an industrially advanced country. In the latter, a difference between an income only half the national average and one twice the average may be the difference between tolerable subsistence and considerable comfort. Numerically, relative inequality in the two countries is the same; but welfare inequality is obviously much greater for the country with the lower national income per capita. In this light, the distribution of income by size associated with maximum welfare of individuals is that in countries with both high average income per capita and a narrow range in inequality of income among various classes. Notable examples are Australia and New Zealand.

Distribution by Type of Use.—Whatever the national income per capita, most of the annual product is consumed; only a small proportion is saved or accumulated as capital. In countries whose national income per capita is small, the reason is low productivity: the total product is not large enough to permit much diversion for addition to the stock of capital. In countries whose national income per capita is large, the reason is a natural pressure for a high standard of living, for a share on the part of consumers in the great and increasing productivity of the economy.

One would expect that the bigger the national income per capita, the lower the proportion of national product consumed and the higher the percentage saved for addition to capital stock. But the available data show no such association. Rough estimates suggest that in some of the lower-income-per-capita countries, the pressure of demand for capital and the power of the state to keep ultimate consumption down to maximize capital accumulation (usually under state auspices) raise the proportions diverted to capital formation above those realized in richer countries with less pressure for new capital and a more democratic social system.

The distribution of the consumer expenditures component is naturally associated with income level. In countries and among consumer groups with low per capita income, outlays on food and other perishables dominate consumer budgets, leaving only small shares for durable commodities (furniture, household equipment, cars, etc.) and for services (education, recreation, personal). These durable commodities and the services loom much larger in consumer expenditures in countries and among consumer groups with high per capita income.

Problems of Interpretation.—Interest in national income goes back at least to the beginning of national states. Some early estimates are available for a few countries (Great Britain, end of the 17th century; France, end of the 18th century; United States, 1800 and 1801). But periodic measurement of national income and its components did not become widespread until the 20th century. World War I emphasized the need for comprehensive totals in planning the war-production effort; and acute economic problems in the 1920s and the 1930s served to concentrate attention upon nation-wide levels of production and employment. During the decades that intervened between World Wars I and II, adequate national-income estimates became available for many more countries and in a few were carried back several decades. The extension and elaboration of national-income measures continued through World War II. The estimates were widely

employed in the measurement of the economic war effort, in assaying postwar production and employment prospects, in international agreements and plans. Measurement of national income might well become a practice as widespread and its results as commonly employed as estimates of populations and of their composition.

The problems toward whose solution national-income measures were expected to contribute would naturally differ from country to country. Where the economic system was characterized by low productivity, the pressure for accelerated industrial development would mean emphasis upon uses of national-income measures in connection with maximizing capital accumulation and raising the productivity of the labour force. In countries that had reached a high stage of economic development, the problem would not be so much one of using the national product to raise the nation's productive capacity as of maintaining a level at which existing capacity would be used adequately and relatively full employment assured. And in the sphere of international relations, with probable competition among countries characterized by differing political and social structures, comparisons of national income would be made as a test of the comparative efficiency of the economies and hence as a partial measure of comparative viability of political and social systems.

Different uses call for different national totals, some of which diverge from the standard definition of national income given above, but may not always be clearly distinguished by a specific term. Combined with such multiplicity of variants are differences among countries, or within each country between different periods, in the scope of economic activity that can be measured and in the adequacy of the market valuation bases. A national-income estimate reduces diverse economic realities to a single quantity (or series of the latter) by limiting the scope of activities to be covered; measuring them in terms of a common denominator, market prices, and applying a set of rules as to what is to be counted as production cost in calculating net product. Agreement upon scope and basis of measurement is not easy even among investigators who deal with the same country over a short period or a group of countries with similar social and economic structures. It becomes much more difficult when the common denominator is to be applied to an agreed-upon scope of activities and distinctions between gross and net, for a variety of countries differing in social structure, or even for the same country for historical periods characterized by different economic and social conditions.

Such definition of national income and its components, valid for both peace and war, for both the present and the more distant past and for countries differing substantially in their social system is not impossible; but it still remained to be developed at mid-20th century. Meanwhile, the available measures, by commonly omitting certain activities (*e.g.*, housewives' services), failed to reflect the differing importance of these omitted activities as between country and country, or within the same country from period to period. By using market prices as the common denominator, often without any adjustments, the available measures failed to approximate closely the relative weight of various commodities and services as they would be in a valuation system less distorted than existing markets are by monopolies, state interference and group differences in economic power. And by allowing for only the most obvious production costs in passing from gross to net product, the available measures failed to adjust for the greater living expenses of population in industrially advanced countries—higher costs of urban life rather than larger net returns to consumers. These various limitations, of which those cited are merely a few examples, do not arise through the faults of estimators but from defects in the data or compromises adopted for the sake of getting some estimates based upon a common denominator that will find widest acceptance.

The sole practicable means of assuring proper interpretation and legitimate use is full cognizance of how the national-income estimates are derived and of the limitations of scope and character of their coverage. Summaries of diverse and changing economic realities, they become the more useful the more they and their components are studied at the various stages of the flow process of economic activity (production, distribution, consumption). If examined against the background of the complex and changing reality they try to summarize, the measures can serve as useful guides to economic theory and policy, guides that help narrow the area over which the uninhibited, because uninformed, narrow group interests and class theories can hold sway.

In using national-income estimates, caution is especially needed today when the character and contents of the economic systems the world over are changing rapidly; the differences with respect to economic organizations among countries are more pronounced than they were in the 19th and early 20th century. Because of these changes, some of the generalizations noted above may become invalid. Because of these differences much more than the totals and a few components are needed before significant comparisons of national income for various countries can be made. Nevertheless, a body of roughly comparable estimates, in combination with other data, may facilitate understanding of how the various economies functioned in the past and how this past sets the general direction and boundaries of their future. (S. KU.)

NATIONALISM, a state of mind, in which the supreme loyalty of the individual is felt to be due to the nation-state. Though attachment to the native soil, to parental traditions and to established territorial authorities have been known throughout history as prevailing sentiments of varying strength, nationalism began only at the end of the 18th century to become a generally recognized sentiment moulding public and private life and one of the great, if not the greatest, single determining factors of history. Thus nationalism is a modern movement, but in the short span of its existence as a dominant element of societal life and organization, it has shown such a dynamic vitality and such an all-pervading character, that the mistake has been frequently made of regarding nationalism as a permanent or at least very ancient factor of history. In reality, nationalism arose as a dominant force in the 18th century in western Europe and in North America; the American and the French revolutions may be regarded as its first powerful manifestations; from the western world it spread at the beginning of the 19th century to central Europe, thence, towards the middle of the century, to eastern and southeastern Europe, until, at the beginning of the 20th century, it put its stamp on the ancient lands of Asia and Africa, after having penetrated the new countries of Latin America. Thus nationalism has become at present a force dominating everywhere on earth, so much so that the 19th century has been called "the age of nationalism" in Europe, while the 20th century has witnessed the rise and struggle of national movements throughout Asia.

Nationalism implies the identification of the state or nation with the people, or at least the desirability of determining the extent of the state according to ethnographic principles. In the age of nationalism, but only in the age of nationalism, the principle was generally recognized that each nationality should form a state, its state, and that the state should include the whole nationality. Formerly states, or territories under one administration, were not delineated by nationality; men's loyalty was not due to the nation-state, but to different other forms of political aspiration: the city-state, the feudal fief and its lord, the dynastic state, the religious group or the sect. The nation-state not only did not form a reality during the greater part of history, for a very long time it did not appear even as an ideal. In the first 15 centuries of the Christian era the ideal was the universal world-state, not the loyalty to any separate political entity. The Roman empire had set the great example which survived not only in the Holy Roman empire of the middle ages, but also in the *res publica christiana* and in its later secularized form of a united world civilization and world policy as it appeared in the writings of the 17th century

As political allegiance, before the age of nationalism, was not determined by nationality, so was civilization not regarded as nationally determined. During the middle ages civilization was regarded as determined religiously; for all the different nationalities of Christendom as well as for those of Islam there was but one civilization—Christian or Mohammedan, and but one language of culture—Latin (or Greek) or Arabic (or Persian) Later in the periods of renaissance and classicism, it was the ancient Greek and Roman civilizations which became a universal norm, valid for all people and all times. Still later the French civilization was regarded throughout Europe as a valid civilization for all educated people of all nationalities. It was only at the end of the 18th century that for the first time civilization was regarded as determined by nationality and that the principle was put forward that man can be educated only in his own mother tongue, not in languages of other civilizations and other times, be it classical languages or the literary creations of other peoples who had reached a high degree of civilization. From the end of the 18th century on, the nationalization of education and national life went hand in hand with the nationalization of states and political loyalties. In many cases poets and scholars emphasized cultural nationalism first, reformed the national language, elevated it to the rank of a literary language, delved deep into the

national past, so as to prepare the foundations for the political claims for national statehood soon to be raised by a people in which the spirit of nationalism had been kindled by writers and educators.

Though national feeling was evident in certain groups at certain periods, especially periods of stress and conflict before the 18th century, nationalism became only in the 18th century a dominant force. Its rise was prepared by a number of complex events: the creation of large and centralized states by the absolute monarchs, which destroyed the feudal allegiances and thus made the integration of all loyalties in one centre possible; the secularization of life and education which fostered the development of the vernacular languages and weakened the ties of religious or sectarian loyalties; the growing economic interdependence which demanded larger territorial units, which would at the same time give the necessary scope to the dynamic spirit of the rising middle classes and their capitalistic enterprise. All these developments created the large and unified territorial state with its political and economic centralization. This existing form of the nation-state was filled in the 18th century with a new spirit of nationalism. It received from it an emotional fervour, similar to that which in preceding periods characterized religious movements. Under the influence of the new theories of the sovereignty of the people and of the rights of man, the king as centre of the nation was replaced by the people. No longer was he the nation or the state; the state, formerly a royal state, had become the people's state, a national state, a fatherland. The word "patrie" gained a new emotional depth and a new activist fervour. The land was no longer the king's, no longer his, but the nation's, ours, the land of our fathers and of our children, a fatherland. The nation, no longer the king or a ruling oligarchy, felt itself responsible for the country's destiny; nation and state became identified, as civilization became identified with national civilization.

This new thinking of nationalism was opposed to all the conceptions which had dominated thought for the last 2,000 years. During that period man had commonly stressed the general and the universal and seen in unity the desirable goal. Nationalism stressed the peculiar and parochial, the differences and the national individualities. These tendencies have become more pronounced as nationalism developed. In the 17th and 18th centuries the common standards of western civilization, the regard for the universally human, the faith in reason, one and the same everywhere, and in common sense, the survival of the Christian and Stoic traditions: all that was too strong to allow nationalism to develop its full tendencies, and to disrupt the society of man. Thus nationalism in its beginning was thought compatible with cosmopolitan convictions and with the general love of mankind. This was especially true of nationalism in western Europe and North America.

The first full manifestation of modern nationalism occurred in 17th-century England, in the Puritan revolution. That century saw England the leading nation in the scientific spirit, in commercial enterprise, in political thought and activity. Swelled by an immense confidence in the new age and in the immense possibilities opening up, the English people felt upon their shoulders the mission of history, a new sense that they, the common people of England, were builders of destiny at a great turning point from which a new true reformation and a new liberty would start. In the English revolution a new optimistic humanism and Calvinist ethics merged; the influence of the Old Testament formed the new nationalism by identifying the English people with ancient Israel. The new message, carried by the new people not only for England, but for whole mankind, was expressed in the writings of Milton in whose famous vision the idea of liberty was seen spreading from Britain, "celebrated for endless ages as a soil most genial to the growth of liberty" to all the corners of the earth. "Surrounded by congregated multitudes, I now imagine that I behold the nations of the earth recovering that liberty which they so long had lost; and that the people of this island are disseminating the blessings of civilization and freedom among cities, kingdoms and nations."

English nationalism was thus much nearer to its religious matrix than later nationalism which rose in the 18th and 19th centuries after the process of secularization had made much greater progress; the nationalism of the 18th century shared, however, with English nationalism the enthusiasm for liberty, the humanitarian character, the emphasis upon the individual and his rights and upon the human community beyond all national divisions. The rise of English nationalism coincided with the rise of the English trading middle classes; it found its final expression in Locke's political philosophy. It was in that form that English nationalism influenced American and French nationalism in the following century.

The rising nationalism of the 18th century settlers in British North America was influenced partly by the English traditions of the Puritan revolution and of Locke, and partly by the new rational interpretation given to English liberty by the French philosophers of the century. American nationalism became the typical product of the 18th century: the American settlers became a nation in a fight for liberty and individual rights on the basis of the thought of the century as expressed above all by Thomas Jefferson and Thomas Paine. It was a liberal and humanitarian nationalism, regarding America as the vanguard of mankind on its march to greater liberty, equality and happiness for all. The ideas of the 18th century had found their first political realization in the Declaration of Independence and in the birth of the American nation. Their deep influence was felt in the French revolution which enthroned French nationalism as the decisive factor in place of French royalty.

Rousseau had prepared the soil for the growth of nationalism, not only by his stress of popular sovereignty and of the general co-operation of all in forming the national will, but also by his regard for the common people as the true depository of civilization. Under his influence Johann Gottfried Herder gained a new understanding of art and civilization by emphasizing folk lore, folk songs and primitive popular traditions as revealing the true creative forces of a nation. He went beyond Rousseau in his appeal to the past, often to the primitive past. He glorified the instinctive and irrational, and turned the attention from the universally human and general to the peculiarities of each national tradition, regarding them as valuable sources of creative inspiration. Under Herder's influence German romantic nationalism later stressed these factors of irrationalism and of national peculiarities; while the nationalism of the French revolution was the triumphant expression of a rational faith in common humanity and liberal progress. The famous slogan of "liberty, equality, fraternity" and the Declaration of the Rights of Man and of the Citizen were not only thought valid for the French people, but for all peoples. Individual liberty, human equality, fraternity of all peoples: these were the common corner-stones of all liberal and democratic nationalism. In their name the French nation constituted itself, overthrew the monarchy and began soon to spread the new gospel across Europe. Under their inspiration a new ritual was developed which partly took the place of the old religious ritual: festivals and flags, music and poetry, national holidays and patriotic sermons: in the most varied forms nationalism permeated all manifestations of life. Like the rise of American nationalism, the rise of the French produced a deep change in the art of warfare: the nation in arms. These citizen armies, untrained but filled with a new fervour, proved in America and in France superior to the highly trained professional armies of the 18th century who fought however without the incentive of nationalism. The revolutionary French nationalism stressed the element of will, of free individual decision, in the formation of nations. Nations were constituted by an act, in self-determination of their members. The plebiscite became the instrument whereby the will of the nation was expressed. Nationalism meant, in America as well as in revolutionary France, the adherence to an idea, a universal progressive idea, looking towards a common future of freedom and equality, not towards the past which had been characterized by authoritarianism and inequality.

Napoleon's armies spread this nationalism throughout Europe and even into the near east; under the inspiration of the American and French revolutions it aroused the Latin Americans. But Napoleon's yoke turned the newly awakened nationalism of the European peoples against France. In Germany where the struggle was led by writers and intellectuals it turned not only into a rejection of Napoleon's rule but of all the principles upon which the American and the French revolutions were based, and against the liberal and humani-

National Parks, Monuments, etc.	Location	Acres Owned by U.S. June 30, 1951	Outstanding Characteristics
National Parks			
Acadia 1919	Maine	28,619.50	Scenic, rugged coastal area on Mount Desert Island, most prominent elevation on eastern seaboard; also includes picturesque Schoodic point on mainland.
Big Bend 1944	Texas	692,304.70	Spectacular mountain and desert scenery; variety of unusual geological structures; enclosed in the great bend of the Rio Grande.
Bryce Canyon 1928	Utah	36,010.38	Rocks among the most colourful of any of the earth's crust, exposed in a box canyon and shaped by erosior into pinnacles and grotesque forms.
Carlsbad Caverns 1930	New Mexico	45,526.59	Large subterranean labyrinth; a series of connected caverns with a myriad of magnificent and curious formations.
Crater Lake 1902	Oregon	160,290.33	Lake of deepest blue in heart of once active volcano; encircled by multicoloured lava walls 500 to 2,000 ft. high.
Everglades 1947	Florida	1,228,488.00	Largest remaining subtropical wilderness in U.S ; abundant wildlife.
Glacier 1910	Montana	998,797.31	Superb Rocky mountain scenery, with numerous glaciers and lakes nestling among the highest peaks; forms part of the Waterton-Glacier International Peace park, established on May 2, 1932.
Grand Canyon 1919	Arizona	645,295.91	Tremendous mile-deep gorge, 4 to 18 mi wide, 217 mi. long, of which 105 mi. are within the park; contains fantastically eroded and coloured rock masses.
Grand Teton 1929	Wyoming	298,737.85	Series of imposing high peaks which constitute the scenic climax of the majestic Teton range; once a noted landmark of Indians and "Mountain Men "
Great Smoky Mountains 1930	North Carolina; Tennessee	505,166.61	Loftiest range east of the Black hills and one of the oldest land areas on earth. Outstandingly diversified and luxuriant plant life, often of extraordinary size.
Hawaii 1916	Territory of Hawaii	176,456.60	A spectacular volcanic area; includes two volcanoes in frequent eruption, also one of world's largest dormant volcanoes; luxuriant tropical vegetation; fern forests.
Hot Springs 1921	Arkansas	1,019.13	Contains 47 mineral hot springs said to have therapeutic value; known to the Indians and early Spaniards.
Isle Royale 1940	Michigan	133,838.51	Forested island, the largest in Lake Superior, distinguished for its wilderness character; great moose herd; pre-Columbian copper mines
Kings Canyon 1940	California	453,064.82	Sublime mountain wilderness dominated by the two enormous canyons of the Kings river and by the summit peaks of the High Sierra.
Lassen Volcanic 1916	California	103,509.28	Lassen peak, only recently active volcano in United States proper, erupted between 1914 and 1921; spectacular volcanic exhibits
Mammoth Cave 1936	Kentucky	50,695.73	Historic series of underground passages; beautiful limestone formations; river 360 ft. beneath surface; famous for more than a century.
Mesa Verde 1906	Colorado	51,017.87	Most notable and best preserved prehistoric cliff dwellings and other structures in the United States.
Mount McKinley 1917	Alaska	1,939,319 04	Mount McKinley, highest mountain in North America; large glaciers of the Alaska range; caribou and mountain sheep.
Mount Rainier 1899	Washington	241,571.09	Greatest single-peak glacial system in the United States, radiating from the summit and slopes of an ancient volcano; dense forests.
Olympic 1938	Washingtor	841,032 04	Mountain wilderness containing finest remnant of Pacific northwest rain forests; active glaciers; rare Roosevelt elk.
Platt 1906	Oklahoma	911 97	Numerous cold mineral springs with distinctive properties, including several bromide springs.
Rocky Mountain 1915	Colorado	253,919.63	One of the most magnificent and diversified sections of the Rocky mountains, with 65 named peaks in excess of 10,000 ft.
Sequoia 1890	California	385,099 79	Great groves of giant sequoia trees, world's largest and probably oldest living things; magnificent High Sierra scenery, including Mount Whitney, highest mountain in United States proper.
Shenandoah 1935	Virginia	193,472.98	Tree-covered mountains in the heart of the Blue ridge; scenic Skyline drive; panoramic views of historic Virginia.
Wind Cave 1903	South Dakota	27,885.67	Limestone caverns in scenic Black hills, decorated by beautiful "boxwork" formations tipped with white crystals; buffalo herd.
Yellowstone 1872	Wyoming; Montana; Idaho	2,213,206.55	World's greatest geyser area, with about 3,000 geysers and hot springs; spectacular falls and canyon of the Yellowstone river; one of the world's greatest wildlife sanctuaries.
Yosemite 1890	California	757,200 61	Mountainous region of unusual beauty, Yosemite and other inspiring gorges with sheer granite cliffs; spectacular waterfalls; three groves of giant sequoias.
Zion 1919	Utah	94,241.06	Multicoloured gorge in heart of southern Utah's dramatic desert and canyon country; erosional formations of great height and spectacular carving.
National Historical Parks			
Abraham Lincoln 1939	Kentucky	116 50	Log cabin believed to be that in which Abraham Lincoln was born, enclosed in protective memorial building on the site of Lincoln's birthplace.
Chalmette 1939	Louisiana	69.61	Part of the ground on which was fought the battle of New Orleans, a brilliant U S victory of the War of 1812 and one which brought much fame to Andrew Jackson Includes military cemetery
Colonial 1936	Virginia	7,146.66	Most of Jamestown Island, site of first permanent English settlement in U.S ; Yorktown, scene of U.S. victory over Cornwallis, 1781, culminating battle of Revolution.
Morristown 1933	New Jersey	958.37	Sites of military encampments during the Revolution; George Washington's headquarters, 1779–80.
Saratoga 1948	New York	2,113 59	Scene of decisive U S. victory over the British in 1777.
National Monuments			
Ackia Battleground 1938	Mississippi	49.15	Site of a Chickasaw Indian village and a memorial commemorating the battle of Ackia, in which the Chickasaws, aided by British troops, repulsed attack of the French and their Choctaw allies, May 26, 1736.
Andrew Johnson 1942	Tennessee	16.33	Pres Andrew Johnson's home, tailor shop and grave
Appomattox Court House 1940	Virginia	968.25	Scene of the surrender on April 9, 1865, of the Confederate army under Gen Robert E Lee to the Federal army under Gen. Ulysses S. Grant

National Parks, Monuments, etc.	Location	Acres Owned by U.S. June 30, 1951	Outstanding Characteristics
National Monuments—Continued			
Arches 1929	Utah	33,929.94	Extraordinary examples of erosion in the form of giant arches, windows, pinnacles and pedestals.
Aztec Ruins 1923	New Mexico	27.14	Ruins of a great prehistoric American Indian town built of masonry and timber in the 12th century; largely excavated and stabilized.
Badlands 1939	South Dakota	123,492.46	Magnificently eroded layers of sedimentary deposits containing great numbers of prehistoric animal fossils.
Bandelier 1916	New Mexico	27,048.89	Ruins of prehistoric Indian homes of the later Pueblo period, built in the canyon-slashed slopes of the Pajarito plateau.
Big Hole Battlefield 1910	Montana	200.00	Site of important battle along the line of the famous retreat of Chief Joseph and his Nez Perce Indians in 1877.
Black Canyon of the Gunnison 1933	Colorado	13,176.02	Remarkable deep narrow canyon with sheer rocks of great geologic interest so altered through compression and lava intrusion that their origin is in doubt.
Cabrillo 1913	California	.50	Memorial to Juan Rodriguez Cabrillo, who discovered San Diego bay in 1542.
Canyon de Chelly 1931	Arizona	83,840.00	Prehistoric Indian ruins built at the base of sheer red cliffs or in caves in canyon walls; contains modern Navaho Indian homes and farms.
Capitol Reef 1937	Utah	33,068.74	Twenty-mile-long buttressed sandstone cliff of Gothic appearance, with dome-shaped white formations superimposed on lower colourful strata.
Capulin Mountain 1916	New Mexico	680.42	Huge cinder cone, an interesting example of an extinct volcano.
Casa Grande 1918	Arizona	472.50	Ruined adobe tower built by Indians who farmed the Gila valley between A.D. 1300 and 1450; the only prehistoric building of its particular type in the U.S.
Castillo de San Marcos 1924	Florida	18.51	Oldest masonry fort in the United States; construction started in 1672 by the Spanish to protect St. Augustine, first permanent white settlement in the U.S.
Castle Clinton 1950	New York	1.00	Structure, built in 1808–11, which served as harbour defense and later as immigrant depot, 1855–90.
Castle Pinckney 1924	South Carolina	3.50	Part of the early defenses of Charleston harbour.
Cedar Breaks 1933	Utah	6,172.20	Great natural amphitheatre eroded into the vividly coloured Pink Cliffs formation which there has a depth of 2,000 ft.
Chaco Canyon 1907	New Mexico	21,239.95	Thirteen major Indian ruins without equal in the U.S., representing highest point of Pueblo prehistoric civilization; hundreds of smaller ruins.
Channel Islands 1938	California	1,119.98 (land area)	Large rookery of sea lions; unique plants and mammals; and fossils ranging from marine invertebrates to Pleistocene elephants This monument includes Santa Barbara and Anacapa Islands.
Chiricahua 1924	Arizona	10,529.80	Wilderness of unusual rock shapes; rock strata telling story of nearly 1,000,000,000 years of the earth's forces.
Colorado 1911	Colorado	18,120.55	Sheer-walled canyons, towering monoliths and weird formations hewed by erosion in sandstone.
Craters of the Moon 1924	Idaho	47,210.67	Fissure eruptions, volcanic cones, craters, lava flows, caves and other volcanic phenomena.
Custer Battlefield 1946	Montana	765 34	The monument is on the site of the famous battle of the Little Bighorn river, June 25, 1876, in which Lt. Col. George A. Custer and his command of 226 were destroyed to a man by the Sioux Indians.
Death Valley 1933	California; Nevada	1,860,138.31	Vast desert solitude, weird natural phenomena, extensive salt beds and borax formations; includes lowest point in United States, 280 ft. below the sea; famous in history of the west; a great obstacle to the forty-niners in California gold rush.
Devil Postpile 1911	California	798.46	Symmetrical blue-gray columns rising as high as 60 ft., fitting closely together, a remnant of a basaltic lava flow.
Devils Tower 1906	Wyoming	1,193.91	An 865 ft. tower of columnar volcanic rock, the remains of an igneous intrusion; first national monument.
Dinosaur 1915	Utah; Colorado	190,798.49	Nation's richest fossil quarries containing skeletal remains of giant reptiles and other creatures of remote geologic time; deep gorges.
Effigy Mounds 1949	Iowa	1,000.00	Numerous Indian mounds in shapes of birds and animals.
El Morro 1906	New Mexico	240 00	"Inscription Rock," soft sandstone monolith on which are carved hundreds of inscriptions, including those of early Spanish explorers and early U S. emigrants and settlers; also prehistoric petroglyphs
Fort Frederica 1945	Georgia	79.30	Built in 1736–48 by Gen. James Edward Oglethorpe, colonizer of Georgia, as an English outpost against Spain.
Fort Jefferson 1935	Florida	47,125.00	Largest all-masonry fortification in western world, built in 1846 for control of Florida straits Federal military prison during and after the Civil War Outstanding bird refuge. Extraordinary marine life.
Fort Laramie 1938	Wyoming	214.41	Buildings of old fort that served as principal U.S. military post guarding caravans on route of forty-niners and the Oregon trail.
Fort Matanzas 1924	Florida	227.76	Spanish fort built in 1737 to protect back door to St. Augustine. Near this site Pedro Menendez de Avilés massacred two parties of French Huguenots in 1565, thus determining that Florida should remain Spanish rather than French territory.
Fort McHenry 1939	Maryland	47.64	The successful defense of this fort on Sept. 13–14, 1814, inspired the writing of the U.S. national anthem.
Fort Pulaski 1924	Georgia	5,427.39	Massive early 19th-century fortification whose successful bombardment by federal rifled cannon in 1862 first demonstrated total ineffectiveness of old-style masonry fortresses.
Fort Sumter 1948	South Carolina	2.40	Scene of the engagement marking the beginning of the War Between the States.
Fossil Cycad 1922	South Dakota	320.00	Deposits of fossil remains of fernlike plants of Mesozoic period or Age of Dinosaurs

National Parks, Monuments, etc.	Location	Acres Owned by U.S. June 30, 1951	Outstanding Characteristics
National Monuments—Continued			
George Washington Birthplace 1930	Virginia	393.68	Memorial mansion and gardens on the site of Washington's birthplace.
George Washington Carver 1951	Missouri	210.00	Site of birthplace and childhood home of the U.S. Negro chemurgist and agricultural experimenter.
Gila Cliff Dwellings 1907	New Mexico	160.00	Well-preserved cliff dwellings in four natural cavities in the face of an overhanging cliff.
Glacier Bay 1925	Alaska	2,297,734.10	Great tidewater glaciers and exhibit of early stages of postglacial forests.
Grand Canyon 1932	Arizona	196,051.00	Part of the Grand canyon of the Colorado river containing Toroweap point with its unusual view of the inner gorge and recent lava dam.
Gran Quivira 1909	New Mexico	450.94	Site of 17th-century Spanish mission; ruins of two mission buildings and of 18 Indian pueblo house mounds.
Great Sand Dunes 1932	Colorado	35,908.19	Shifting sand dunes entrapped by a great hook in the Sangre de Cristo mountains; they are among the largest and highest dunes in the United States.
Homestead 1939	Nebraska	162.73	Site of the first claim under the Homestead Act of 1862, marking the beginning of homesteading, the U.S. democratic land settlement policy.
Hovenweep 1923	Utah; Colorado	410.32	Four groups of remarkable prehistoric towers, pueblos and cliff dwellings.
Jewel Cave 1908	South Dakota	1,274.56	Cave in limestone formation consisting of series of chambers connected by narrow passages; numerous side galleries; fine calcite crystal encrustations.
Joshua Tree 1936	California	427,096.49	Representative stand of the rare Joshua tree; many other varieties of desert flora.
Katmai 1918	Alaska	2,697,590.00	Dying volcanic region; includes the Valley of Ten Thousand Smokes, scene of a violent eruption in 1912.
Lava Beds 1925	California	46,161.99	Principal theatre of the Modoc Indian War of 1873; unusual exhibits of volcanic activity.
Lehman Caves 1922	Nevada	640.00	Caves of light gray and white limestone honeycombed by tunnels and galleries of stalactite formations.
Meriwether Lewis 1925	Tennessee	300.00	Site on Natchez trace where Meriwether Lewis, leader of the Lewis and Clark expedition, was buried.
Montezuma Castle 1906	Arizona	783.09	One of the best preserved and most interesting cliff dwellings in the United States; built in cavern-pitted limestone cliff; original 5-story, 20-room castle is 90% intact.
Mound City Group 1923	Ohio	57.00	Famous group of prehistoric Indian mounds.
Muir Woods 1908	California	473.96	Virgin stand of coast redwoods, the tallest of living things.
Natural Bridges 1908	Utah	2,649.70	Three natural bridges carved out of sandstone; the highest is 222 ft. above the stream bed, with span of 261 ft.
Navaho (Navajo) 1909	Arizona	360.00	Three of largest and most intricate of known cliff dwellings—Betatakin, Keet Seel and Inscription House.
Ocmulgee 1936	Georgia	683.48	Numerous outstanding and unique remains of mounds and prehistoric towns, representative of the cultural evolution of the southern mound-builder civilization.
Old Kasaan 1916	Alaska	38.00	Site of abandoned Haida Indian village.
Oregon Caves 1909	Oregon	480.00	Caves in limestone formation of great variety and beauty.
Organ Pipe Cactus 1937	Arizona	328,161.73	Examples of organ pipe cactus and other desert plants found nowhere else in United States; traces of the Camino del Diablo, historic Spanish route.
Perry's Victory and International Peace Memorial 1936	Ohio	14.25	At Put-In bay Commodore O. H. Perry won greatest naval battle of War of 1812; commemorates century of peace between the United States and Canada.
Petrified Forest 1906	Arizona	85,303.63	Spectacular display of petrified wood; Indian ruins and petroglyphs; portion of colourful Painted desert.
Pinnacles 1908	California	12,817.77	Spirelike rock formations 500 to 1,200 ft. high, together with numerous caves and a variety of volcanic features.
Pipe Spring 1923	Arizona	40.00	Historic Mormon fort, also structures built by Mormons during 1869–70 and later used by private ranchers and as cattle-buying and shipping point; commemorates significant phase of westward movement by U.S. pioneers.
Pipestone 1937	Minnesota	115.60	Notable for its quarry from which Indians obtained materials for making peace pipes used in ceremonies.
Rainbow Bridge 1910	Utah	160.00	Greatest of world's known natural bridges; a symmetrical arch of salmon pink sandstone, curving in form of a rainbow; rises 309 ft. from bottom of gorge.
Saguaro 1933	Arizona	53,669.24	Cactus forest containing giant saguaro unique to deserts of southern Arizona and northwestern Mexico.
Scotts Bluff 1919	Nebraska	2,196.44	Well-known landmark on Oregon trail associated with mass migration between 1843 and 1869 across treeless plains.
Shoshone Cavern 1909	Wyoming	212.37	A cave of considerable extent decorated with encrustations of crystals.
Sitka 1910	Alaska	57.00	Site of Indian stockade where Kik-Siti tribe made last stand against Russian settlers.
Statue of Liberty 1924	New York	10.38	Colossal copper statue on Bedloe's Island; a gift of the people of France; commemorates alliance of France and U.S. during American Revolution; universal symbol of freedom and democracy.
Sunset Crater 1930	Arizona	3,040.00	Truncated volcanic cone, the upper portion so highly coloured as to give rim appearance of sunset glow; lava flows and ice caves.

National Parks, Monuments, etc.	Location	Acres Owned by U.S. June 30, 1951	Outstanding Characteristics
National Monuments—Continued			
Timpanogos Cave 1922	Utah	250 00	Limestone cavern located on side of Mount Timpanogos, with passageways leading back into the mountain.
Tonto 1907	Arizona	1,120.00	Two large and well-preserved Pueblo cliff dwellings occupied during the early part of the 14th century by Indians who farmed in the Salt River valley.
Tumacacori 1908	Arizona	10 00	Historic Spanish Catholic mission building on site first visited by Father Kino, a Jesuit, in 1691.
Tuzigoot 1939	Arizona	42.67	Excavated ruins of a prehistoric pueblo which flourished between A.D. 1000 and 1400; outstanding example of large late prehistoric pueblos of the Verde valley.
Verendrye 1917	North Dakota	253.04	Commemorates the Verendrye explorations in North Dakota and along the upper Missouri river.
Walnut Canyon 1915	Arizona	1,641 62	Cliff dwellings in shallow caves under ledges of limestone, built by Pueblo Indians about 1,000 years ago.
White Sands 1933	New Mexico	140,247 04	Glistening white gypsum sands, drifting into dunes 10 to 60 ft. high.
Whitman 1940	Washington	45.84	Site where Marcus Whitman and his wife ministered to spiritual and physical needs of Indians until massacred by them in 1847; landmark on Oregon trail.
Wupatki 1924	Arizona	34,853 03	Red sandstone prehistoric pueblos built by group of farming Indians whose descendants are believed to be the picturesque Hopi.
Yucca House 1919	Colorado	9 60	Remnants of once thriving prehistoric Indian village.
Zion 1937	Utah	33,920.75	Colourful Kolob canyon and famous Hurricane Fault, notable examples of geologic phenomena.
National Military Parks Chickamauga and Chattanooga 1890	Georgia; Tennessee	8,127.16	Embraces battlefields of Chickamauga, Orchard Knob, Lookout mountain and Missionary ridge, important in operations around Chattanooga during 1863.
Fort Donelson 1928	Tennessee	102.54	Fortification controlling the upper Cumberland river, captured by Gen. U.S. Grant in 1862.
Fredericksburg and Spotsylvania County Battlefields Memorial 1927	Virginia	2,420 71	Embraces portions of Fredericksburg, Chancellorsville, the Wilderness and Spotsylvania Court House battlefields, where major battles were fought between 1862 and 1864.
Gettysburg 1895	Pennsylvania	2,541.86	Battlefield that is often considered the turning point of the Civil War; portion of battleground dedicated as burial ground by Pres. Abraham Lincoln in his famous Gettysburg address
Guilford Courthouse 1917	North Carolina	148.83	Commemorates battle fought March 15, 1781, between British and U S. forces, which marked the beginning of the end of the Revolutionary struggle
Kings Mountain 1931	South Carolina	4,012.00	Site of an important victory for U.S. frontiersmen at a critical point in the Revolutionary War, Oct. 7, 1780.
Moores Creek 1926	North Carolina	30 00	Scene of a memorable battle in 1776 between North Carolina Whigs and Tories
Petersburg 1926	Virginia	1,501 17	Scene of the "Battle of the Crater" and of the longest siege in the history of the United States, 1864–1865; about 100 mi. of well-preserved earthworks
Shiloh 1894	Tennessee	3,729.26	Natural park embracing the battlefield of Shiloh near Pittsburg Landing (1862) which prepared the way for Gen. U.S. Grant's successful siege of Vicksburg; also well-preserved Indian mounds.
Stone River 1927	Tennessee	323.86	Scene of a stubbornly fought midwinter battle in 1862, which began the great Federal offensive to trisect the Confederacy. Includes part of the battlefield and a portion of Fortress Rosecrans.
Vicksburg 1899	Mississippi	1,323.56	Remarkably preserved fortifications of 47-day siege of Vicksburg (1863), which gave the North control of the Mississippi river and cut the Confederacy in two
National Memorial Park Theodore Roosevelt 1947	North Dakota	59,420.56	Badlands along Little Missouri river and part of Theodore Roosevelt's Elkhorn ranch.
National Battlefield Parks Kennesaw Mountain 1947	Georgia	3,094 21	Historic field on which occurred one of the two heavy assaults made by Gen. William Sherman on Confederate positions during Atlanta campaign (June 27, 1864).
Richmond 1944	Virginia	684.44	Scene of several battles in defense of Richmond during the Civil War; includes portions of battlefields of first and second Cold Harbor and Malvern hill, and massive fortifications along the James river and at Fort Harrison.
National Battlefield Sites Antietam 1890	Maryland	183.33	Scene of the battle which brought to an end Lee's first invasion of the North in 1862; includes avenues and monument plots, and overlooks Burnside bridge and the sunken road or "bloody lane."
Brices Cross Roads 1929	Mississippi	1 00	Scene of the battle of June 10, 1864, in which Confederate cavalry under Gen. Nathan B. Forrest was employed with extraordinary skill.
Cowpens 1929	South Carolina	1.00	Site of Daniel Morgan's victory over the British under Banastre Tarleton on Jan. 17, 1781.
Fort Necessity 1931	Pennsylvania	2.00	Scene of a battle between colonial troops led by George Washingto. and French troops assisted by Indians, July 3, 1754; opening battle of the French and Indian War.
Tupelo 1929	Mississippi	1 00	Commemorates the battle of Tupelo, July 13 and 14, 1864.
White Plains 1926	New York	.00	Memorials showing the positions held by George Washington's army at the battle of White Plains in 1776.
National Historic Sites Adams Mansion 1946	Massachusetts	4.05	Home of Presidents John Adams and John Quincy Adams; Charles Francis Adams, U.S. minister to Great Britain during the Civil War; Henry Adams; and Brooks Adams.
Atlanta Campaign 1944	Georgia	20.96	Marks significant points on the route of Gen. William Sherman's march from Chattanooga to Atlanta, prelude to the "March to the Sea" which finally trisected the Confederacy.
Federal Hall Memorial 1930	New York	.49	On this spot, the site of the modern federal subtreasury building, stood Federal hall, the first seat of the new federal government and the scene of many momentous events in the early days of the republic.

National Parks, Monuments, etc.	Location	Acres Owned by U.S. June 30, 1951	Outstanding Characteristics
National Historic Sites—Continued			
Fort Raleigh 1941	North Carolina	10 70	Place of first attempted English settlement within the confines of the United States, 1585–87. Site of the "Lost Colony" settlement of Sir Walter Raleigh and birthplace of Virginia Dare, first child of English parentage to be born in the new world.
Hampton 1948	Maryland	43.30	One of the great Georgian mansions built in the U.S during the latter part of the 18th century.
Home of Franklin D. Roosevelt 1944	New York	33 23	Fine home in the "Hudson River bracketed" style; birthplace, home and "Summer White House" of Pres. Franklin D. Roosevelt where many distinguished visitors were entertained.
Hopewell Village 1938	Pennsylvania	848 06	One of the finest examples of U S 18th- and early 19th-century iron-making villages; includes the ruins of the old furnace and numerous dependent structures.
Jefferson National Expansion Memorial 1935	Missouri	82.58	Commemorates the territorial expansion of the United States and conspicuous persons and events connected therewith.
Manassas National Battlefield Park 1940	Virginia	1,670.74	Scene of the battles of First and Second Manassas on July 21, 1861, and Aug. 29–30, 1862. The former battle, often called "Bull Run," was the first test of Northern and Southern military prowess. Jackson acquired the nickname "Stonewall" there.
Old Philadelphia Custom House 1939	Pennsylvania	.79	This building, completed in 1824, is one of the finest U.S. examples of Greek revival architecture; famous as the second bank of the United States, which figured so prominently in the historic controversy between Pres. Andrew Jackson and the Whigs over national banking policies.
Salem Maritime 1938	Massachusetts	8 61	Includes Derby wharf, the Richard Derby house, Hawkes house and the Old Customs house in which Nathaniel Hawthorne worked—all of national significance because of their associations with the early New England architectural, maritime and literary history.
San Juan 1949	Puerto Rico	40 00	Massive masonry fortifications begun by the Spanish in the 16th century to protect the harbour.
Vanderbilt Mansion 1940	New York	211.65	Mansion and grounds of Frederick W. Vanderbilt overlooking the Hudson river; fine example of the palatial U S. residence of the period 1880–1900.
National Memorials			
De Soto 1949	Florida	24.18	Commemorates the landing of Ferdinando de Soto in Florida in 1539.
House Where Lincoln Died 1896	District of Columbia	.05	Lincoln died there on April 15, 1865; house was refurnished to give atmosphere of a typical home of the 1860s.
Kill Devil Hill Monument 1927	North Carolina	314.40	Site of the first sustained flight by a heavier-than-air machine, made by Wilbur and Orville Wright.
Lee Mansion 1925	Virginia	2.71	Splendid antebellum home of Robert E. Lee, commander in chief of the Confederate army.
Lincoln Memorial 1922	District of Columbia	.61	Classical structure of great beauty with a seated figure, 20 ft. high, of Abraham Lincoln.
Lincoln Museum 1932	District of Columbia	.18	Located in this building was Ford's theatre in which Lincoln was shot by John Wilkes Booth on the night of April 14, 1865; contains famous collection of Lincolniana.
Mount Rushmore 1929	South Dakota	1,220.32	Colossal figures carved on the face of Mount Rushmore, delineating the features of four great presidents: George Washington, Thomas Jefferson, Abraham Lincoln and Theodore Roosevelt.
New Echota Marker 1930	Georgia	.92	Site of the last capital of the Cherokee Indians in Georgia.
Thomas Jefferson 1943	District of Columbia	1.20	Circular colonnaded structure or rotunda in classic style introduced in the U S. by Thomas Jefferson; on interior walls are four panels with inscriptions based upon writings of Jefferson.
Washington Monument 1885	District of Columbia	.37	Built in commemoration of George Washington, this monument (in the form of an obelisk, 555 ft. high) is one of the dominating features of the U.S. capital.
National Cemeteries			
Antietam 1862	Maryland	11.36	The cemetery is divided into segments, each representing a state. Interments (1951): 4,908 (unidentified 1,836).
Battleground 1864	District of Columbia	1.03	On Georgia Ave., between Van Buren and Whittier Sts. Interments (1951): 44.
Fort Donelson 1867	Tennessee	15.34	Interments (1951): 740 (unidentified, 512).
Fredericksburg 1865	Virginia	12.00	Interments (1951): 15,341 (unidentified, 12,770).
Gettysburg 1863	Pennsylvania	15.55	Interments (1951): 4,155 (unidentified, 1,664).
Poplar Grove 1866	Virginia	8.72	Cemetery is on camping ground of the 50th regiment of New York engineers. Interments (1951): 6,288 (unidentified, 2,163).
Shiloh 1866	Tennessee	10.25	Burial place of men who fell at battle of Shiloh and the surrounding area. Interments (1951): 3,695 (unidentified, 2,417).
Stone River 1865	Tennessee	20.09	Interments (1951): 6,277 (unidentified, 2,560).
Vicksburg 1865	Mississippi	119.76	Two miles north of city on U.S. highway 61. Includes many who died in a radius of 150 mi. from Vicksburg during the Civil War. Interments (1951): 17,682 (unidentified, 12,911).
Yorktown 1866	Virginia	2.91	Interments (1951): 2,204 (unidentified, 1,446).
National Parkways			
Blue Ridge Parkway 1933	Virginia, North Carolina	49,207 42	Scenic parkway averaging 3,000 ft above sea level; follows Blue Ridge mountains and embraces several scenic and recreational areas; 346 mi. of an estimated 477 mi. were completed or under construction in 1951.
George Washington Memorial Parkway 1930	Virginia; Maryland	2,917 33	Embraces many interesting landmarks associated with the life of George Washington; planned as continuous boulevard along the Maryland and Virginia shores of Potomac river. The 15-mi. completed section in 1951 included Mount Vernon Memorial highway between the U.S. capital and Mount Vernon
Natchez Trace Parkway 1934	Mississippi; Tennessee; Alabama	15,806 75	Follows general location of the old Indian trail between Nashville and Natchez, known as the "Natchez Trace," an important route in early travel. In 1951, 156 mi of an estimated 450 mi were completed or under construction.
Suitland Parkway 1949	District of Columbia Maryland	662.87	Four-lane parkway connecting South Capitol St., D.C., with Andrews air base, Md. In 1951 two of the four lanes of the nine-mile road were completed.
National Capital Parks			
National Capital Parks 1790	District of Columbia; Va.; Md.	29,223.71	Park system of the U.S. capital comprising more than 770 units in the District of Columbia and vicinity.

especially of wildlife. All areas of the system are game sanctuaries. The basic wildlife policy is to permit each native species, once established on a normal, healthy basis, to carry on its struggle for existence without artificial aid, in the belief that this is for the ultimate good of the species and conforms to primary national park purposes, provided a proper balance among all species is maintained. Should emergency management of a particular species become necessary, protective measures may be adopted. Careful management of Yellowstone's buffalo herd, including the introduction of new animals from an outstanding private herd, ensured survival of this once-vanishing species.

The forests of the national parks are priceless remnants of the formerly widespread virgin forests of the United States. Held as representative exhibits of the great forests of the past, their protection is a service responsibility of the first magnitude. These forests not only serve to enhance the scenic grandeur of the parks, but they also are important in the protection of watersheds and in the regulation of stream flow. In addition, they provide habitats for many species of wildlife. Their protection involves preventing and combating forest fires and controlling insect infestations and tree diseases. The park meadowlands also must be protected against overgrazing in order to avoid erosion, to preserve the natural cover and to provide forage for the parks' grazing animals that depend upon them for forage.

Nonconforming Uses.—Constantly recurring demands are made by special interests for the use of park features for private gain, to the detriment of the great mass of citizens who own and are entitled to enjoy the national park areas. Attacks are primarily directed at the use of high mountain lakes and rivers for power and irrigation development; at certain park forests, cutting of which would afford a temporary prop to overexpanded and sometimes declining local industries while seriously impairing the beauty of the parks; at minerals; and at mountain meadow lands for domestic cattle grazing. All of these resources are available elsewhere, although possibly at greater cost to the proponents of the projects.

The waters of Yellowstone National park have frequently been the targets of irrigation and power project proponents. Repeated attempts to dam Yellowstone lake were defeated, as were proposals directed at the use of other scenic park lakes. A 1938 project to dam Yellowstone lake for commercial irrigation, which involved construction of a dam and tunnel within the park, brought a protest from the secretary of the Swedish government committee on planning and recreation.

The outstanding example of exploitation and despoliation of a national park feature for private gain was the damming of Hetch Hetchy valley in Yosemite National park to provide a water supply for the city of San Francisco. This occurred before the establishment of the national park service and during a period in U.S. history when exploitation rather than conservation was the watchword.

Since all national park areas are deficient in rangeland, the grazing of livestock constitutes a threat to park wildlife. Experiments in cattle grazing during World Wars I and II proved conclusively that to extend such grazing privileges would ruin park meadows with resultant disastrous effect upon the deer, elk, antelope, buffalo and other wildlife species which are such an important feature in the national park scene. These experiments also demonstrated that livestock grazing in the parks could not appreciably influence the meat situation in the U.S.

Visitors' Facilities.—Foreseeing the demand for accommodations for visitors to national parks, congress provided, in the acts creating the various parks, for the granting of franchises to private capital for the furnishing of public facilities. This franchise policy was reaffirmed in the act establishing the national park service. Operations, prices, plans and types of expansion are subject to approval by the national park service.

Later, however, a beginning was made toward government ownership of the physical plants, wherever possible, with operation on a concession basis. The most significant development in this field came in 1941 with the formation of a nonprofit-distributing private corporation known as National Park Concessions, Inc., to operate hotel and other facilities on lands at Mammoth Cave National park that had been donated to the government.

Interpretive-Services Initiated.—The basis for interpretive programs throughout the national park system is found in the desire of the visitor to develop his understanding and appreciation of characteristic park features, to be stimulated in his thinking, and to be guided in the full use of the park areas. In the scenic and scientific areas he wants to know the genesis of the Grand canyon, the cause of eruptive geysers, and the underlying causative factors of the other geological and the biological features. In the historic areas his desire is to know who did what, when and where.

In the early days of park use, information, frequently based upon folklore and local opinion, was furnished by the picturesque old-time guides. With the influx of visitors that came with the arrival of the motor age, the need was demonstrated for an interpretive service based upon the latest scientific and historical data. Such a service was inaugurated in Yosemite National park in the form of a free nature guide service in 1920. The California State Fish and Game commission, the University of California and certain private interests co-operated in making this experiment possible. The guide service rapidly spread to other parks, both on a federal basis and with private financial assistance. Meanwhile the American Association of Museums secured funds from the Laura Spelman Rockefeller memorial to further the study for and construction of museums in Yosemite and Yellowstone National parks.

Historic Sites Act.—Although national monuments, military parks and other areas had long been established, it was not until 1935 that congress, through passage of the Historic Sites act, provided the implement for undertaking a comprehensive program for investigation, selection and protection of nationally significant historic and prehistoric sites. In the selection and evaluation of proposed sites the advisory board on national parks, historic sites, buildings and monuments passes on and recommends to the secretary those to be considered for national recognition.

In addition to the historic sites established as units of the national park system, the Historic Sites act provides authority for the secretary of the interior to designate outstanding areas in state or local government or private ownership as historic sites and to enter into co-operative agreements with nonfederal agencies for the conservation of national historic sites regardless of title to the property.

The national park service in its historical program endeavours to interpret to the public the broad national aspects of the history of the United States. Beginning with the undocumented history of the American Indian showing the colourful evolution of pre-Columbian peoples, the story carries through the period of documented history.

The national park service seeks to present a well-balanced program of prehistoric and historic sites illustrative of the growth and development of the United States in terms of physical remains. It emphasizes preservation rather than restoration or reconstruction, adhering to the principle that it is better to preserve than to repair, better to repair than to restore and better to restore than to reconstruct. Through the Historic American Buildings survey, photographs and measured drawings have been made of many historic structures.

Recreational Demonstration Areas.—As part of the federal government's plan to acquire and reallocate mistreated and worn-out agricultural lands to better use, the national park service in 1934 undertook acquisition of 46 such areas in 24 states and their development as recreational demonstration areas, designed primarily to provide organized camp and other recreational facilities. Since these areas had never been considered part of the national park system, their development was a contribution of the service in the field of local recreation.

State Parks.—The state park movement, however, grew along with that in the national field, and even antedated national parks. In 1864 Pres. Abraham Lincoln approved an act of congress setting aside Yosemite valley and the Mariposa Grove of Big Trees to be administered as a public trust by the state of California. Following establishment of Yosemite National park, these areas were receded to the federal government for inclusion therein. In 1885 New York's first state parks were established, and other state parks followed in the 1890s. Through the interest of national park service officials and other prominent conservationists, a meeting was called in Iowa in 1921 which resulted in establishment of the National Conference on State Parks to stimulate and give direction to the provision of outdoor recreational opportunities.

(I. F. S.; X.)

NATIONAL PROVINCIAL BANK LIMITED. This British banking institution has branches in London and the provinces. The amalgamation movement wrought great changes in the English banking system, and the National Provincial bank was closely identified with it, particularly during the period from 1918 to 1924. An important amalgamation effected by the bank took place in 1918 when it took over the Union of London and

Smiths Bank, Limited. In the same year, the business of the Bradford District Bank, Limited was acquired. The Sheffield Banking Company, Limited was absorbed in 1919, the Northamptonshire Union Bank, Limited in 1920 and the Guernsey Banking Company, Limited in 1924. A number of private banks also were absorbed.

The parent bank was founded in 1833. At the time of its establishment, the creation of joint stock banks had but recently been legalized, and any such banks conducting business within 65 mi. of London were denied the right of issuing notes, at that time a lucrative privilege. It was decided to confine the banking activities of the new company to the provinces, thereby securing the right of note issue, and to maintain control from an administrative office in London.

The first office was opened at Gloucester on Jan. 1, 1834, and by 1838 there were 60 offices open. After some years the directors decided that the advantages of conducting business in London would outweigh those of retaining their note issue. Accordingly, business commenced in 1866 in Bishopsgate, London. At that time the bank was given a seat in the London Bankers' clearing house, a privilege hitherto withheld owing to the antagonism of the private banks to their joint stock rivals. In 1880 it was registered as a limited liability company.

NATIONAL RECOVERY ACT: *see* UNITED STATES.

NATIONAL SAVINGS. Saving means the setting aside for future use of part of current income—the excess over the amount currently consumed or paid in taxes. Saving may thus be performed by anybody having an income—by an individual, a family or by a business firm.

Because of disagreement as to the sense in which a government body has an income, there is some difference of opinion among economists as to whether or not it is appropriate to say that governments (as distinct from the citizens and businesses under their jurisdiction) carry on saving. But whether or not the *government* is said to save, the *nation* may be said to save the sum of the amounts saved by the individuals and business firms (plus government bodies if they are considered to have savings) which it includes. Since there are always some individuals and businesses whose current expenses and taxes outrun their incomes, and whose savings are therefore negative, national savings must be thought of as a net total with negative savings subtracted out.

Forms Taken by Savings.—Saving is often spoken of loosely as if it were synonymous with the piling up of savings deposits, or of idle cash. This interpretation is misleading. While it is true by definition that savings are not spent on the consumption of the saver, it does not follow that they are not spent at all; what is saved often is spent. It may be spent directly by the saver or indirectly by business firms he helps to finance, on the purchase of new items being added to the community's stock of wealth, such as new houses or machinery. It may be spent indirectly on the consumption of some other person who borrows or sells property to finance his negative savings. It may help to finance a government deficit, thus supporting whatever spending the government is carrying on, whether for battleships, highways, food to feed the hungry or for routine government expenses.

Part of current savings—sometimes a small part, sometimes a large part—appears in the form of increase in savings deposits and other cash assets held by the individuals or business firms doing the saving. The remainder is represented in their accounts by additions to their holdings of physical property, acquisition of government or private securities, reduction of their debts owed to others, etc.

Savings and Investment.—Under the generally accepted use of terms, it will always be found at the end of any accounting period that if the revenues and expenditures of government are equal (the budget balanced) and if all government expenditures are on current account, national savings for the period amount to just as much as investment in new buildings, equipment, etc. This is a matter of definition. Saving means the excess of national income over consumption and taxes. Investment is taken to mean the excess of net national product (which is the same thing as national income) over the parts of the product made up of consumption goods and services and items bought by government expenditures.

Since economic progress depends largely on the increase of wealth through investment, it follows also that economic progress is linked with the achievement of national savings. Some increase in production might be possible without any net national savings, through increasing the labour force, finding new ways to use existing equipment and labour, and replacing old equipment and buildings as they wear out (*see* DEPRECIATION) with more modern types.

But to make full use both of the growing labour force and of new methods of production requires a net increase of plant, equipment, etc.; besides this there is always a backlog of opportunities to increase production, with pre-existing methods and labour force, for which more equipment would have been required.

The need of investment and savings to increase production is of course most acute in countries where modern technology has not yet been put into operation and in devastated areas where houses, workshops, transportation equipment, etc., have been destroyed.

This is the meaning of the much-misunderstood doctrine of "abstinence": if there is to be an increase of productive wealth, somewhere in the economic system somebody must abstain from consuming his entire income. It does not necessarily follow that those who abstain from consuming are suffering. On the contrary, in so far as saving is left to individuals, it is performed chiefly by persons with high incomes who both save heavily and consume considerably more than the average.

But for the community as a whole it is impossible both to consume the whole of current income and to build up productive wealth.

It should be observed that these propositions do not prove that economic progress either will or will not be served by an increased inclination to thrift on the part of individuals and business firms. Progress depends on the achievement of substantial investment and therefore of substantial savings. But as John Maynard Keynes pointed out, decisions to save and decisions to invest are taken by different persons operating under different incentives. A decision by one individual to save more, unaccompanied by a decision by him or anybody else to invest more, cannot be guaranteed to increase the volume of saving and investment actually realized; in fact, many economists argue that the effect would be to decrease that volume. This point will be examined further below.

Effect of Government on Savings-Investment Relation.—If the government's revenues and expenditures are unequal, the relation of savings to investment just described is modified. In a period of depression, for example, the tax base shrinks and reduces revenue, while the addition of relief, etc., to government responsibility increases expenditure. Government is therefore obliged to finance its expenditures in part either by borrowing, by paying out cash on hand or by issuing money. Some savers, consequently, either use their savings to buy government securities, or hold more cash, or have larger balances with banks and other credit institutions while the latter have more cash and government securities. The same is true when a government deficit is incurred for war purposes.

In these circumstances it is no longer true that the net total of savings made by individuals and businesses is equal to the net total invested by individuals and businesses in new productive wealth. Private savings exceed private investment by the amount of the deficit. Whether national savings are said to exceed national investment is a matter of language. Some part of government expenditure (used to pay for productive wealth such as hydroelectric dams, roads, needed buildings, recreation facilities) can reasonably be described as investment. Any excess of the deficit over such government investment can be described as negative saving by government, reducing the net total of national savings. This way of using language has the advantage of stressing the fact that when government savings are positive (*i.e.*, when government has an excess of revenue over current expenses, the excess serving to reduce government's net debt and to finance government investment) there can be an increase of the nation's

productive wealth in the absence of private saving. It has the drawback, however, of inviting dispute as to the scope and measurement of government activity to be classified as investment (particularly in time of war) and leaving statistical measurements of national savings with a much wider range of possible error than measurements of private savings. (*See* also INVESTMENT, ECONOMIC ASPECTS OF; INVESTMENTS: IN BUSINESS).

Ways of Estimating Savings.—For an individual there are two ways to measure his savings for a given accounting period. One is to estimate his income and subtract his current expenditure, the difference being his savings. The alternative is to examine his balance sheet (his property and his debts) at the beginning and end of the period and measure the increase in net worth which reflects his saving. While the figures taken out of the individual's accounts under these two procedures are different, the two are logically equivalent. In either case it is necessary to make sure that we do not include in income (or in the increase of net worth) any items which reflect merely changes in price levels at which pieces of property are valued, or items reflecting events not regarded as linked with income—broadly speaking, to exclude capital gains and losses (whether realized or "paper") from income. For example, losses due to property destruction by enemy action in wartime, or gains due to a rise of prices on the stock market, would be excluded in income determination. If income is measured by the rules generally adopted by national income statisticians, the result is to exclude not merely the effects of price changes but some actual physical changes—chiefly losses —in wealth. The net total of savings estimated in this way tends to exceed the value of additions to the nation's stock of wealth to the extent that war damage, uninsured fire losses and similar events fail to appear in the income account. On the other hand, it tends to fall short to the extent that new wealth is found (for example through mineral discoveries) or that wealth becomes more useful through new techniques (for example, through the development of dry farming techniques which made previously worthless land take on value).

For national totals, estimates based on changes in national wealth would be too unreliable for use because of the inaccuracy of the reports on which wealth statistics are based, the extraordinary difficulty of allowances for price changes, and other drawbacks. But the general principles just described suggest three other ways of estimating national savings: (1) by estimating investment, with adjustments for government; (2) by estimating income of individuals, personal taxes paid, and consumption expenditures to give savings of individuals by subtraction, with separate estimates for savings of business corporations and of government bodies; and (3) by estimating changes in the various asset and liability accounts of individuals which reflect current savings, with separate estimates for the savings of business corporations and of government bodies. All these methods are in practical use.

War Savings.—Savings under war conditions follow different patterns than in peace. Individuals and businesses set aside a larger proportion of their incomes, so that net private savings grow enormously. On the other hand, private investment is restricted because war needs divert labour and materials from making buildings and equipment for private use. Public construction and acquisition of equipment by government expands, but most of the resulting facilities are either used up in the war or are inconvertible to civilian uses thereafter. The consequence is a great growth in the paper wealth of individuals and business firms (corresponding to the growth of the government's debt) with little or no growth in actual productive wealth.

Not much precise information is available about savings during World War I. Interwar studies reveal that individuals and business firms saved in 1919 a much larger proportion of income than in any year in the 1920s, and that savings in 1920, though declining, were still high. For World War II, comparatively reliable studies made at the time show that the proportion of income saved rose well above peacetime levels during 1941 and continued to rise thereafter. At the peak of war activity, individuals were saving nearly one-third of their disposable incomes (*i.e.*, income payments less personal taxes), and corporations well over one-half of theirs.

The total wartime accumulation by individuals amounted to far more than the income of any single year of the interwar period, and the great bulk took the form of additional currency, bank deposits, government securities and claims upon life insurance companies.

It is probable that the savings of the richer groups of the population made up a much smaller proportion of the war savings than of peacetime savings, but the difference must not be exaggerated. About half of the wartime accumulation of individuals and corporations was accounted for by the growth in their holdings of government bonds—more than two-thirds in denominations of $500 and upward—which were not to any great extent small savings. The proportion of the growth in bank deposits, currency and insurance claims representing large savers was probably still higher.

Motives for Saving.—Saving is a very complex phenomenon. Different savers save for different reasons, and a given saver for a mixture of reasons. At any given moment, furthermore, many individuals find themselves spending less or more than their incomes simply because their incomes are more or less than was expected when commitments to spend were made. This is true especially for farmers and self-employed business and professional men whose incomes are subject to unexpected fluctuations.

In so far as saving goes back to decisions to save, the main motives seem to be the following: (1) provision for a future period when income is expected to be less or the need for expenditure greater than at present—for example, provision for retirement, education or vacations; (2) provision against unpredictable decline in income or growth in need—for example, against sickness in the family or loss of earning power by the breadwinner; (3) acquisition of higher income, either by improving the equipment, etc., of a business, or by being housed better or at less expense, or by obtaining interest, dividends, rent or other property income; (4) gain in social status through acquiring property; or (5) direct subjective satisfaction from accumulation ("miser's" instinct). Pulling against these motives, of course, is the desirability of current consumption, and the desirability of having more leisure at the expense of potential income.

This hypothesis about the motives for saving explains the record fairly well. High-income individuals have greater incentives to save than low-income individuals, for example, because the former are: (1) a group many of whose members are enjoying temporary increase of income and must expect a drop later on; (2) have better opportunities to place savings where they will yield income; (3) are more able to gain power and social approbation by saving and (4) are less hard-pressed to maintain what they regard as necessary standards of consumption and of leisure. Rural people are more inclined to save than urban people of like income because: (1) their incomes are more uncertain; (2) their opportunities to gain income from saving are better and the fruits of their savings, in buildings, livestock, equipment, etc., are more visible and thus more conducive to improved social standing and direct enjoyment and (3) their standards of consumption and of leisure are less exacting. War savings are higher than peacetime savings because: (1) incomes are regarded as abnormally high and are above immediately previous levels; (2) ordinary outlets for negative savings (retirement of elderly people, education, prolonged vacations and medical treatments) are reduced; (3) incomes are less secure; (4) social pressures to save are intensified and (5) normal standards of consumption and leisure are suspended. The fact that the rising trend of real per capita income did not bring a rising trend in the proportion saved in the prewar and interwar period is explained by: (1) progressive urbanization; (2) rising standards of consumption and leisure; (3) the trend away from private houses and away from direct ownership by individuals of tangible business property (which reduces both opportunities to gain income and opportunities to gain social status and direct satisfaction by increase of property); (4) the downward drift in interest rates and (5) increased importance

of some sources of negative savings (in particular the increased stress upon higher education and the increased proportion in the population of elderly people who tend to live on past savings). (*See* also CAPITAL AND INTEREST; CONSUMPTION; INCOME: ECONOMIC DEFINITION; NATIONAL DEBT; NATIONAL INCOME; SOCIAL SECURITY.) (A. G. HT.; X.)

NATIONAL SOCIALISM, the name of a movement started as the Nationalsozialistische Deutsche Arbeiterpartei (NSDAP) by Adolf Hitler in Germany in 1919. Its name revealed its emphasis upon nationalism, socialism, Germanism and the working class. Like Benito Mussolini's fascism, it combined an appeal to extreme and exclusive nationalism and chauvinist expansionism with a revolutionary call to the masses. Many traits were from the beginning common to fascism and national socialism, which may be regarded as the German form of fascism. Both proclaimed themselves the implacable enemies of liberalism and democracy, of individual rights and all movements of international co-operation and peace; both stressed the subordination of the individual to the state, the inequality of men and races, the right of the strong to rule the weak, and the necessity of the principle of blind and unswerving obedience to leaders appointed from above. Both praised the military virtues, despised and rejected pacifism, humanitarianism and charity, glorified hatred and conquest, and aimed at the transformation of the whole nation into an armed camp and an instrument of perpetual readiness for warfare.

National socialism, however, had its peculiarly German roots. Some can be traced to the Prussian tradition as it developed under the inspiration of great soldier kings such as Frederick William I and Frederick II and men of blood and iron such as Bismarck. This tradition had always regarded the militant spirit and the discipline of the Prussian army as the model for all individual and civic life. To it was added the tradition of political romanticism with its sharp hostility to rationalism, to the principles underlying the French Revolution, to the "superficiality" of the west, and with its emphasis on instinct, on the past, even on the remote past, and its proclamation of the rights of the exceptional over all universal law and rules. Thus, the exceptional becomes a law unto himself. These two traditions were later enforced by the 19th-century adoration of science and of the laws of nature which with their "iron logic" worked out beyond all concepts of good and evil, and by a biological theory of life which led to the acceptance of that racialism first proclaimed by the Frenchman Joseph Arthur, count de Gobineau, in his *Essai sur l'inégalité des races humaines* (1854 and 1884), and then propounded by Richard Wagner (1813–83), who combined it with a heroic ideal of the Nordic superman, and by his son-in-law, Houston Stewart Chamberlain, whose *Foundations of the Nineteenth Century* (1899) profoundly influenced early Hitlerism. To romanticism, national socialism owed the vague and fluid conceptions of folk as the basis of cultural and political organization, and of *Weltanschauung* or "total world outlook" as opposed in the name of *Kultur* to the more rational civilization of the west.

In addition to these currents in the German tradition, it ought to be pointed out that Hitler's formation was influenced during his youth by specific Austrian movements. National socialism owed much to Karl Lueger (1844–1910), who organized the Catholic lower middle classes of Vienna in an anticapitalistic and anti-Semitic movement called the Christian Socialist party, but who remained loyal to Habsburg conservatism, and to Georg von Schönerer (1842–1921), who combined racial anti-Semitism with a violent anti-Catholicism and pan-Germanic expansionism and a bitter hostility to the Habsburgs. Schönerer's disciple Karl Hermann Wolf founded among the Sudeten Germans in Bohemia a German Workers' party which was later to assume the name of Deutsche National-Sozialistische Arbeiterpartei, a few years before Hitler founded his almost identically named NSDAP in Munich.

Much in Hitler's ferocious nationalism and his contempt of the Slavs can be explained by the experience of his youth amid the bitter nationality struggles of the multiracial Habsburg empire.

When Hitler started his agitation in Munich immediately after World War I he found the intellectual soil well prepared by the writings of the German romanticists, and of the German publicists of the War of Liberation such as Ernst Moritz Arndt (1769–1860) and Friedrich Ludwig Jahn (1778–1852). The last years before World War I were characterized by a renewed interest in romanticism and in the War of Liberation of 1813. In those years a German youth movement with its longing for a true community, a *Gemeinschaft,* the rebirth of the nation, and with its vague mystical enthusiasm for leadership and comradeship, expressed the opposition to rationalism and "bourgeois" liberalism. It had come largely under the influence of Friedrich Nietzsche (1844–1900) and the German poet Stefan George (1868–1933). Oswald Spengler (1880–1936), the author of *Decline of the West* (Eng. trans., new ed., 1939), *Preussentum und Sozialismus* (1920) and *Hour of Decision* (Eng. trans., 1934), and Moeller van den Bruck (1876–1925), the author of *Der preussische Stil* and *Das Dritte Reich,* can be regarded as the immediate forerunners of national socialism in the intellectual field. But the intellectual preparation would in no way have been sufficient for the growth of national socialism in Germany if the defeat in World War I with its ensuing disillusionment and pauperization, especially in the lower middle classes, had not paved the way for Hitler's propaganda. The peace treaty of Versailles gave to Hitler a starting point, but the violent opposition which he evoked was not directed in reality against the peace treaty but against the fact that Germany had been defeated and that its plans had been frustrated. From the beginning Hitler's propaganda appealed to the military circles, who regarded the peace only as a temporary setback in Germany's expansionist program. Hitler added to the pan-Germanic aspirations for world hegemony the almost mystical fanaticism of a faith in the mission of the German race and the fervour of a social revolutionary gospel. In the years of political and economic depression which followed Germany's defeat, Hitler's appeal to the German masses as the bearers of the most exalted racial ideals in the world was eagerly accepted to counteract their inferiority complex.

Though Hitler accepted many elements of the technique of the bolshevist revolution, he found a powerful ally in the widespread fear of bolshevism which he exploited, first in Germany and then on a world-wide scale, posing as the bulwark against bolshevism. Thus, he secured the financial and moral support of many conservative circles who misunderstood the revolutionary and nihilistic character of his movement and its many points of similarity with the appeal and the antiliberalism of bolshevism. On the other hand, he gained the adherence of the masses by vague promises of an anticapitalistic order. The banner of the NSDAP was the red flag of the revolution, but altered to the German imperial colours by the addition of a white circle and a black swastika in the centre. Thus Hitler combined the appeal of social revolution and that of a militant and mystical nationalism; the extraordinary flexibility of his dynamic doctrine enabled him to stress different elements at different times and to adapt his attitude momentarily to changing circumstances, even with complete disregard for previous statements. His most important individual contribution to the theory and practice of national socialism was his deep understanding of mass psychology and mass propaganda in the contemporary world and his perfection of the methods learned from bolshevist technique. His chapter on propaganda in *Mein Kampf* can be regarded as of the most fundamental importance. He stressed the fact that all propaganda must keep its intellectual level to the capacity of the least intelligent of those at whom it is directed, and that its content of truth does not count compared with the only valid criterion, that of success. "The slighter its scientific ballast, and the more exclusively it considers the emotions of the masses, the more complete the success."

Propaganda should say very little, but repeat this very little forever. Hitler understood that, especially with as wide and far-reaching a goal as world domination, it was of the utmost importance to be able to present under one common denominator all potential adversaries who might themselves change according to

the circumstances. "The art of truly great popular leaders in all ages has consisted chiefly in not distracting the attention of the people, but concentrating always on a single adversary. The more unified the object of the people's will to fight, the greater will be the magnetic attraction of the movement and the more tremendous its impact. It is part of a great leader's genius to make even widely separated adversaries appear as if they belonged to but one category, because among weakly and undecided characters the recognition of various enemies all too easily marks the beginning of doubt of one's own rightness." (From Hitler's *Mein Kampf.*) It was a stroke of genius on the part of Hitler to find this common denominator in the Jews and Judaism. This enabled him to discover the "Jew" behind all his changing adversaries, sometimes behind communism or Moscow, at other times behind Great Britain and the United States—in short, behind everybody and everything which at a given moment opposed his wishes or aroused his wrath.

Anti-Judaism served him also for two other purposes. National socialism was fundamentally opposed to all concepts of international co-operation and universal catholicity; it destroyed the framework of a common humanity with common and absolute standards of law, truth and good, applicable to all men. National socialism, therein following Nietzsche, regarded Christianity and prophetic Judaism, with their emphasis on the equality of all men under one common God and upon absolute standards of justice, as alien and inimical to the new hero ideal of the superrace which was interpreted—not by Nietzsche, but by the national socialists—as the true Germanic ideal. Judaism and the ethics of the Bible therefore stood in opposition to national socialism.

National socialism proclaimed the Germanic race as the new *corpus mysticum* on which the salvation of the world depended, as the embodiment of all nobility and creative genius and as the reich which must become the world-controlling reich. This reich necessarily had to have a *Gegenreich,* a counter-race which on a similarly world-wide basis would represent the antithesis of salvation and creative genius. So the Jewish race became the counter-race. National socialism saw its duty not only in the destruction of this counter-race, but in the preparation of the German race for its real task of establishing the new world order. The third reich, ruled by what Hitler called "the highest human species given by the grace of the Almighty to this earth," will have, by suitable education of the youth, in the future a generation mature for the ultimate and greatest decision on this globe. The nation which will first take this road will be victorious," and become "one day the master of the globe."

Working from these principles, Adolf Hitler was able to carry his party from its small beginnings in a beer cellar in Munich to a dominant position in world politics within 20 years. Among his more important collaborators were Alfred Rosenberg, the author of *Der Mythus des 20ten Jahrhunderts,* the most widely read book of the national socialist movement besides Hitler's own *Mein Kampf,* and of *Blut und Ehre;* Rudolf Hess, who helped Hitler write *Mein Kampf* during their internment in the fortress in Landsberg am Lech in 1924; Gregor Strasser, probably the most important of Hitler's collaborators, who separated from him in protest against the leader's opportunist policies and was killed in the blood purge of June 1934; his brother Otto Strasser, who in 1930 founded the Black Front as a more radical wing opposed to Hitler; Gottfried Feder, who drew up the first program of national socialism and was for several years its economic "expert" but thereafter receded into oblivion; Capt. Ernst Röhm, the founder and organizer of the S.A. or *Sturm Abteilungen,* the National Socialist militia, who was purged in June 1934; Julius Streicher, who became famous through his anti-Semitic weekly, *Der Stürmer;* Heinrich Himmler, the organizer and commander of the S.S. or *Schutz Staffel,* Hitler's personal elite guard, and of the gestapo (*Geheime Staats Polizei*), the secret police; Joseph Goebbels, the master of national socialist propaganda; Hermann Goering, the organizer of the German air force and controller of the German industrial mobilization; R. Walther Darré, the author of *Neuadel aus Blut und Boden* and organizer of the national socialist peasant policy; and finally Robert Ley, the leader of the German Workers' front.

It took 14 years for the NSDAP to conquer power in Germany. It had been born at a time when it was only one of many semirevolutionary, reactionary and terrorist organizations springing up as *Freikorps* throughout Germany, composed of former officers and soldiers, students and other elements dissatisfied with the republican democratic and peaceful order which seemed to dawn for Germany in 1919. That it survived and absorbed all others was due to Hitler's leadership and to the fact that Capt. Röhm interested the reichswehr in supporting Hitler. On Feb. 24, 1920, the NSDAP drafted in Munich, the centre of its activities, a program of 25 points, which in 1926 was declared unalterable, but which in reality was very soon surpassed by developments. On Nov. 9, 1923, Hitler, supported by Field Marshal Erich Ludendorff, attempted his first *Putsch* in Munich, but it miscarried. Reaction was so firmly entrenched then in Bavaria, however, that Hitler was let off with only a formal punishment. The ensuing years of political and economic consolidation in Germany did not allow Hitler to make any considerable progress, but the economic crisis at the beginning of the '30s and the lack of energetic measures on the part of the government against the indefatigable propaganda to undermine democracy brought the first great success of the NSDAP in the reichstag elections of Sept. 14, 1930. The reichstag elections of Nov. 6, 1932, marked a temporary setback for Hitler, but an intrigue, started by Franz von Papen, prevailed upon the aged president of the German republic, Marshal Paul von Hindenburg, to name Hitler chancellor on Jan. 30, 1933. He was then only the head of a coalition cabinet of national socialists and members of the conservative and nationalistic right. A fire in the reichstag building on Feb. 27, 1933, gave Hitler the chance to rouse the spectre of a bolshevist revolutionary danger and to hold the elections of March 5, 1933; though they gave the national socialists only 44% of the votes, the antidemocratic totalitarian parties (national socialists and Communists) had a majority following in Germany against the democratic republic, while the democratic forces were weak and without a clear program. Thus, the new reichstag, meeting on March 21, 1933, in the garrison church in Potsdam, the historic receptacle of Prussian military spirit, "enabled" the government to assume dictatorial powers. From that moment on, the relentless process of *Gleichschaltung* began, and within a few months the German reich had become a totalitarian state which was entirely identical with the NSDAP in every concern of public or private life, and that meant with the will of its leader. The death of Hindenburg on Aug. 2, 1934, removed the last conservative obstacle. Hitler became *Reichsfuehrer* and chancellor, the presidency was abolished and all troops and officials were immediately forced to take the oath of fidelity to Hitler personally. The third reich was now to create the "new order" which, according to Hitler, was to last for 1,000 years.

But it was to be not a new order of authoritarianism and of inequality for Germany alone. Its dynamism was bound to expand and to spread. By its own nature it could not recognize any limits of its own volition, only limits set by opposed superior force. The first years were spent in absolute concentration upon forging that instrument which would enable national socialism to establish its military and industrial superiority and thus to fulfil its ambitions. With mounting success, the aims grew in quick progression. The first aim was to unite all Germans within the reich on the basis of "self-determination," which was proclaimed as the right of the German, but denied to other peoples. The next step foresaw the creation of a *Grosswirtschaftsraum,* or a *Lebensraum,* in which the German master race or *Herrenvolk* would rule over a hierarchy of subordinate peoples. The success of that plan widened it into the vision of a hemispheric order which would embrace all of Europe, western Asia and Africa, and finally of a world order which would establish the principles of national socialism, with its emphasis upon the Germans as the leading race, all over the globe. The extreme neomercantilism which received the new name of *Wehrwirtschaft* was accompanied by an extreme cultural autarchy, a resolute hostility against all western thought, a repudiation of all efforts at synthesis between western tradition and Germanism which had been the goal of most of the best Germans in the pre-

ceding centuries. The rejection of the west and its standards of justice, law and reciprocity led also to the proclamation of the official maxim that "Right is whatever profits the German nation; wrong is whatever harms it," which was regarded by Reichsminister Hans Frank, the head of the Academy of German Law, in an address on Dec. 4, 1939, as the "beginning of national socialist justice." The absolute world rule to which national socialism aspired would not only represent, according to national socialist expectations, a military, economic and political domination, but equally an intellectual and moral leadership. Their new world age or *Weltzeitalter* would be German and national socialist at the same time.

National socialist parties existed outside the reich everywhere where there was a population of German descent which national socialist agitation had succeeded in organizing for its own aims. According to national socialist doctrine, loyalty to one's "race" or "blood" took precedence over one's loyalty as a citizen. "Blood," and not a spiritual decision of allegiance, the doctrine taught, was the decisive factor. But this racial basis constituted a weakness of national socialism in its attempt at a world-wide appeal. It helped toward its ultimate defeat.

National socialism, which started a purely German movement, produced by conditions and traditions peculiar to Germany, assumed after 20 years of incessant and successful struggle a world-wide importance and bid to influence and determine the course of history on a world-wide scale. But the attempt at world-wide conquest brought about a coalition of the nations attacked or threatened by Germany to which Germany succumbed in 1945 after almost six years of war. National socialism under Hitler's leadership ended thus in complete failure; the national socialist reich ended in a total catastrophe after 12 years' existence.

NATIONAL WORKSHOPS (in French, *Ateliers Nationaux*), the term applied to the workshops established to provide work for the unemployed by the French provisional government after the revolution of 1848. (The term is also incorrectly applied to the proposed *ateliers sociaux* of Louis Blanc [*q.v.*], state-supported co-operative productive societies.) The revolution was both preceded and followed by a severe financial and industrial crisis which rendered the problem of unemployment in Paris very acute. The provisional government under the influence of one of its members, Louis Blanc, and on the demand of a deputation of Parisian workers, passed a decree (Feb. 25, 1848) which contained bold promises assuring relief from the extreme conditions then prevailing. Moreover, this relief was to be immediate, effectual and universal. The following is an extract from the decree:

"The provisional government of the French Republic undertakes to guarantee the existence of the workmen by work. It undertakes to guarantee work for every citizen."

For the carrying out of this decree Louis Blanc wanted the formation of a ministry of labour, but this was shelved by his colleagues who, as a compromise, appointed the "Luxembourg" labour commission under the presidency of Louis Blanc and with power of inquiry and consultation only. The carrying out of the decree of Feb. 25 was entrusted to the minister of public works, M. Marie, and various public works were immediately started. These included clearing the trench of Clamart and conveying the earth to Paris for the construction of a railway station on the chemin de fer de l'Ouest; construction of the Paris terminus of the Paris-Chartres railway; improvement of the navigation of the Oise and extension of the Sceaux railway to Orsay.

Those applying for work far exceeded the number of jobs available. There was no effective administrative service and no real desire on the part of the government to make the experiment a success.

The disorder and waste were amazing.

Owing to the increase in the number of those claiming work or relief, disorganization set in, and both the bureaus and the *mairies* became the centres of disturbances, those in charge of the offices being unable to control the crowds. As a consequence M. Marie commissioned Émile Thomas, a chemist, connected with the École Centrale, to reorganize the works. When Thomas took the work in hand on March 5, the number of unemployed had increased to 14,000 in addition to about 4,000 or 5,000 employed on public works, and it was steadily on the increase. On March 16 the daily pay of the workmen who were not working was reduced to one franc; work was guaranteed for at least every other day, in which case the pay was to be two francs for the day.

The national assembly had in the meanwhile been elected, and met on May 4. The executive commission was elected a few days later; Louis Blanc was excluded, but all the other members of the provisional government were on it. Blanc renewed his motion for a ministry of labour; this was rejected. The dispersal of the *emeute* of May 15 freed the assembly from fear of the revolutionary clubs, and on May 15 Thomas received instructions to dismiss all unmarried men under 25 years of age who would not enlist in the army, all men who could not prove six months' residence in Paris and all who refused offers of private employment. Piecework was to be established instead of timework, and men were to be prepared to be drafted into the provinces. The protests of Thomas held this plan up, but he was removed from office on May 26 and on June 20 the proposals were approved, and the sequel was the insurrection of June 23 and following days (*see* FRANCE: *History*).

NATIONS, LAW OF: *see* INTERNATIONAL LAW, PRIVATE; INTERNATIONAL LAW, PUBLIC.

NATROLITE, a mineral species belonging to the zeolite group. It is a hydrated sodium and aluminum silicate with the formula $Na_2Al_2Si_3O_{10}.2H_2O$, and containing sodium (Na_2O, 16.3%). "Needlestone" or "needle zeolite" are other names, alluding to the common acicular habit of the crystals, which are often very slender and are aggregated in divergent tufts. Larger crystals have the form of a square prism terminated by a low pyramid: the prism angle being nearly a right angle (88° 45½′), the crystals are tetragonal in appearance, though actually orthorhombic. There are perfect cleavages parallel to the faces of the prism. The mineral also often occurs in compact fibrous aggregates, the fibres having a divergent or radial arrangement. Natrolite is usually white or colourless, but sometimes reddish or yellowish. The lustre is vitreous, or in finely fibrous specimens sometimes silky. The spec. grav. is 2.2, and the hardness 5½. The mineral is readily fusible. It is decomposed by hydrochloric acid with separation of gelatinous silica.

NATTIER, JEAN MARC (1685–1766), French painter, was born in Paris in 1685, the son of Marc Nattier, a portrait painter, and of Marie Courtois, a miniaturist. He received his first instruction from his father, and took the first prize at the

Paris academy at the age of 15. He refused to study at the French academy in Rome, and in 1715 went to Amsterdam, where Peter the Great was then staying. There he painted portraits of the tsar and Empress Catherine, but declined an offer to go to Russia. Between 1715 and 1720 he painted the "Battle of Pultawa," for Peter the Great, and the "Petrification of Phineus and of his Companions," which led to his election to the academy. The financial collapse of 1720 all but ruined Nattier, who was obliged to turn to portraiture. He became the painter of the artificial ladies of Louis XV's court. Notable examples of his straightforward portraiture are the "Marie Leszczinska" at the Dijon museum, and a group of the artist surrounded by his family, dated 1730. He died in Paris in 1766.

Among his pictures are the "Magdalen" at the Louvre; "La Camargo" and "A Lady of the Court of Louis XV" at Nantes; the "Head of a Young Girl" at Orléans and "Mme. de Pompadour" at Marseilles. The Versailles museum owns a group of two ladies, and the Dresden gallery a portrait of the "Maréchal de Saxe." In the Wallace collection are "The Comtesse de Dillières," "The Bath (Mdlle. de Clermont)," "Portrait of a Lady in Blue," "Marie Leszczinska" and "A Prince of the House of France." Nattier's works have been engraved by Leroy, Tardieu, Lépicié, Audran and other noted craftsmen.

See Paul Mantz, "J. M. Nattier" in the *Gazette des beaux-arts* (1904); *Life of Nattier* by his daughter, Madame Tocqué; Pierre de Nolhac, *Nattier* (1904, revised 1910); Lady Dilke, *French Painters of the XVIIIth Century* (London, 1899).

NATURAL BRIDGE, a small village of Rockbridge county, Va., in the western part of the state, 145 mi. W. of Richmond, and about 13 mi. S.E. of Lexington, the county seat. It is served by the Chesapeake and Ohio and the Norfolk and Western railways. In the vicinity of the village, which is about 1,200 ft. above sea level, is the great natural curiosity from which it derives its name—a bridge of natural rock 90 ft. long and from 50 to 150 ft. wide, which spans Cedar creek at a height of 215 ft. above that stream. It consists of horizontal limestone strata, and is the remains of the roof of a cave or underground tunnel through which the creek once flowed. It is crossed by U.S. highway 11. In the village are magnesia and lithia springs and a saltpetre cave.

NATURAL GAS is the name given to the inflammable gas which occurs in porous, subsurface, imperviously capped earth formations. Petroleum is found in many instances with the gas. Brine waters are generally present. The occurrence of natural gas is wide-spread both geographically and geologically. Geographically, natural gas is produced in North America, South America, Europe, Asia and Africa. The major producing fields of North America are: Texas, California, Louisiana, Oklahoma, West Virginia and Pennsylvania; in Canada, the provinces of Alberta and Ontario; in Mexico, the states of Vera Cruz, Tamaulipas and Tabasco; in South America, Venezuela, Colombia, Peru, Argentina, Ecuador and Trinidad; in Europe, the U.S.S.R., Rumania and Poland; in Asia, Iraq, Iran, Indonesia, Bahrein Island, the Indian peninsula and Japan; and in Africa, Egypt. Geologically, these deposits of natural gas are variously found in the Carboniferous, Devonian, Silurian, Ordovician, Cambrian, Tertiary, Cretaceous and Jurassic systems.

Chemical Composition.—Natural gas is for the most part composed of the hydrocarbons of the paraffin series. However, its composition varies considerably in the different fields. Carbon dioxide, nitrogen, hydrogen sulphide and helium are sometimes present.

Natural gas of the east American or Appalachian field is almost entirely made up of methane, ethane, propane, the butanes, and the vapours of pentane, hexane, heptane and octane. The gas from some parts of Texas, Oklahoma and Kansas is high in nitrogen content and some of these high nitrogen gases contain helium. The content of nitrogen is so high in some of the gas from the wells of west Texas, that the gas is noncombustible. Practically all the so-called "sour" gas contains hydrogen sulphide and organic sulphur compounds. Some natural gas of California, Colorado, Utah, New Mexico and Washington contains high percentages of carbon dioxide. Natural gas suitable for producing solid carbon dioxide is obtained in several states and natural "dry ice" plants have been built to utilize this gas in all these states except New Mexico. The rated capacity of these plants totals 80 to 100 tons daily.

Natural gas wells are, and have been for the most part, remote from the gas-consuming markets. Fusion-welded and "Dresser-coupling" steel lines are used in the transportation of gas. Many of these lines are more than 100 mi. in length—one line is 1,000 mi. long. The pressure of transportation varies from 200 to more than 400 lb.—one line transports gas at 1,300 lb. pressure. When and where natural well pressures are inadequate to effect delivery, compressing stations are installed. One large gas-transporting company has 72,700 installed horse-power compressing capacity. Many of the transporting lines are 20 to 22 in. in diameter—one is a 36-in. line. During the winter months when consumption is large, temperatures are low, and transporting pressures are high, it has been necessary to install dehydrating plants on the large lines to eliminate stoppage of lines due to the formation of crystalline hydrates. The hydrate of methane contains six molecules of water, while those of ethane, propane, and iso-butane contain seven molecules of water. These hydrates are stable at all temperatures below 66° F. The other hydrocarbons of natural gas do not form hydrates. The wholesale metering of gas in the large transporting lines is effected with orifice meters. The average deviation of natural gas from Boyle's law at 60° F. is approximately 8% at 300 lb. pressure and 20% at 1,300 lb.

Natural gas as distributed is for the most part refined. It has been processed for the elimination of suspended and finely divided solids and water. On practically all the large transporting systems, gasoline and liquefied petroleum gas recovery plants are installed. In some few instances natural gas is processed to remove its content of hydrogen sulphide and organic sulphur compounds. The so-called "dry" natural gas of commerce is mainly made up of the hydrocarbon methane associated with varying quantities of ethane, propane and the butanes. The total heating value per cubic foot, measured at 60° F. and 30 in. mercury pressure, varies from 1,000 to 1,200 British thermal units. The specific gravity (air = 1) varies from .56 to .67. The explosive limits are 4.8 to 15. Since natural gas has no distinctive odour, an odorous substance is usually added to aid in detecting leakages. The liquefied hydrocarbons—whose critical temperatures are above the prevailing atmospheric temperatures—are ethane, propane, normal butane and isobutane. These are recovered in a high state of purity in plants generally associated with natural gasoline recovery plants.

Gasoline Recovery.—Natural gasoline is recovered by three processes: compression and cooling, oil absorption and charcoal adsorption, and is marketed in a variety of grades, generally based upon two factors; the Reid vapour pressure test at 100° F., expressed in pounds per square inch pressure, and the percentage which is distillable and recoverable at 140° F. Both methods are official and standardized by the U.S. bureau of mines. The chemical composition of natural gasoline will vary with its grade of commercial quality. Generally speaking it is composed of normal butane, the pentanes, the hexanes, the heptanes and the octanes. Those gasolines which have Reid vapour pressures in excess of 22 lb. at 100° F. also contain variable quantities of isobutane and may carry some propane. Practically all the marketed natural gasoline is processed to remove hydrogen sulphide and organic sulphur by some one of the following treatments: dilute caustic soda, dilute sodium hypochlorite, cupric sulphate or monoethanolamine.

The deepest natural gas producing well in the U.S. was drilled to a depth of 15,004 ft. at Wasco, Calif., in 1938. There are now more than 54,000 gas wells operating in the U.S. The Candelaria Well No. 1 in Harris county, near Houston, Texas, has a "shut-in" pressure of 4,800 lb. gauge pressure. The depth of this well is 8,101 ft.

Major Uses of Natural Gas.—The following are statistical data for the United States in 1937:

(1) As fuel—(domestic, commercial and industrial), 2,370,000,000,000 cu.ft.

(2) As source of carbon black manufacture—510,606,000 lb. produced.

(3) As source of natural gasoline recovery—2,039,100,000 gal.
(4) As source of liquefied petroleum gas recovery—141,505,000 gal.
(5) As source of helium recovery—4,809,230 cu.ft.
(6) As source of carbon dioxide (dry ice)—20,000,000 lb.

Minor Uses of Natural Gas.—The following are data for the United States in 1937:

(1) Pentane in the production of 50 synthetic chemicals of greater or less commercial importance.

(2) Mixtures of ethane, propane and the butanes in the mass production of 100 synthetic chemicals—alcohols, alcohol ethers, ketones, esters, acids, acid anhydrides, aldehydes, oxides, amines, ethers and chlorinated derivatives.

(3) Mixtures of ethane, propane and the butanes in the mass production of "poly" gasoline—a motor fuel of high octane rating.

(4) Butane in the production of butadiene, synthetic rubber, and as a solvent for the extraction of oils, fats, resins, nicotine and perfumes.

(5) Propane as fuel in isolated districts and as selective solvent in mass production of motor oils of low cold test, high viscosity index, better colour and bloom and high resistance to oxidation and the formation of carbon and sludge.

(6) Ethane in the production of ethylene—useful in citrus fruit ripening, as an anaesthetic, as a refrigerant and in the manufacture of mustard gas and ethylene bromide. Large quantities of the latter chemical are used in connection with tetraethyl lead to yield high octane (antiknock) motor fuels. (J. B. G.)

NATURALISM, in philosophy, is the view which maintains that all explanation should keep within the realm of what is natural, and avoid all recourse to the supernatural. Thinkers may be agreed about this even if they differ on many other points. Thus, for example, materialism, pantheism and positivism are all naturalistic; but it is absurd to equate them for that reason.

NATURALIZATION: *see* NATIONALITY; NATURALIZATION LAWS.

NATURALIZATION LAWS. Naturalization is the act of investing an alien with the status of a national in a given state. It takes place wherever a new nationality is acquired by a person after his birth. It may be accomplished as the result of voluntary application, special legislative direction, marriage, parental action or annexation of territory. The conditions under which the privilege of naturalization will be granted are fixed by the laws of each nation. International law, however, imposes some limits on the power of a state to naturalize persons, especially nonresidents.

UNITED STATES

The constitution of the United States, article 1, section 8, clause 4, authorized congress to "establish an uniform Rule of Naturalization." Congress fulfilled that mandate by enacting naturalization statutes, commencing in 1790, to establish the conditions under which aliens may be admitted to citizenship. The requirements have never been exacting, and the consistent national policy has been to encourage the naturalization of all qualified aliens. That policy aided in developing the strength and homogeneity of a nation whose growth resulted largely from the contributions of millions of immigrants and their descendants.

Naturalization by Court Process.—The principal method of acquiring a new nationality is through voluntary application in the manner provided by law. Most countries authorize the grant of citizenship by an administrative official. In the United States, however, naturalization from the first became a function of the courts. Congress conferred power to grant naturalization upon all federal district courts and upon state courts of unlimited jurisdiction which have a seal and a clerk. An applicant may appeal to the higher courts from a decision rejecting his petition. The government also is a party in every naturalization case, and it too may appeal when it deems that naturalization was improperly awarded.

The principal disqualification for naturalization was directed against some racial groups. Originally the statutes permitted the naturalization only of "free white persons." In 1870, following the Civil War, Negroes were granted the privilege of naturalization. The next modification was made by the Nationality Act of 1940, which permitted the naturalization of races indigenous to the western hemisphere, chiefly North American Indians and Eskimos. Further modifications were made in 1943, when Chinese were declared eligible; in 1946, when Filipinos and East Indians were permitted to apply; and in 1950, when naturalization benefits were extended to noncitizens of Guamanian ancestry. Except for these specifically designated racial groups, Asiatics were not eligible at mid-century for naturalization as United States citizens. Also disqualified from naturalization were: (1) aliens identified with certain proscribed organizations, activities or beliefs at any time during the period of ten years immediately preceding the petition for naturalization; (2) certain aliens who claimed exemption from military service because of their alienage; and (3) deserters from the armed forces during time of war.

Several basic qualifications always have been prescribed, virtually without change, in the statutes relating to naturalization. It is important to bear in mind that these are general requirements which often have been modified with respect to special groups whom congress desired to favour.

First, the applicant for naturalization must have resided in the United States for at least five years following a lawful admission for permanent residence. Lesser periods of residence, and in some cases no fixed residence requirements, were prescribed for naturalization applications by wives and children of U.S. citizens, persons who serve in the armed forces or the merchant marine and other special categories.

Second, the applicant must establish that he is, and was during the requisite period of residence, a person of good moral character. Persons who have committed serious crimes during that period generally are barred.

Third, the applicant must establish that he is, and was during the requisite period of residence, attached to the principles of the constitution of the United States and well disposed to the good order and happiness of the United States. The latter requirement was designed to exclude from citizenship aliens hostile to the United States and its institutions. For many years the courts also interpreted this requirement as forbidding the naturalization of conscientious objectors to military service. In 1946, however, the supreme court, reversing its earlier holdings, determined that conscientious objectors might be naturalized (*Girouard* v. *United States,* 328 U.S. 61 [1946]).

Finally, the applicant generally must meet several educational requirements. He must demonstrate an understanding of the English language, including an ability to read, write and speak words in ordinary usage. He must sign the petition for naturalization in his own handwriting if he is physically able to write, and must demonstrate some understanding of the constitution and form of government of the United States.

While the ultimate power to grant or deny naturalization was conferred upon the courts, the law vested in the immigration and naturalization service of the department of justice administrative supervision over the naturalization process. The service, headed by a commissioner of immigration and naturalization, was placed under direction of the attorney general and was organized into 16 district offices as well as numerous suboffices throughout the United States. Under the act of June 29, 1906, the immigration and naturalization service was given broad legal authority to receive applications, issue certificates of legal entry, interrogate the applicants and their witnesses and make recommendations to the naturalization courts. This administrative function was designed to aid the courts in discharging their responsibilities in granting or denying naturalization.

The naturalization process commences with the filing of a declaration of intention to become a U.S. citizen. Prerequisites to the filing of such a declaration are lawful entry into the United States for permanent residence and the procurement of an official certificate establishing such entry. The requirement that a declaration of intention be filed is waived in the cases of spouses of U.S. citizens, persons with specified service in the armed forces or the merchant marine and other special groups.

The next step is the filing of a petition for naturalization. If

a declaration of intention is required, the petition may not be filed sooner than two years nor later than seven years after the date of the declaration of intention. An applicant who desires to file his petition for naturalization is notified to appear with two citizen witnesses in court, where they are interrogated under oath in the office of the clerk of court by an examiner of the immigration and naturalization service. Then the applicant files the petition for naturalization, which is signed and sworn to by the petitioner and his two witnesses. Further investigation is conducted and the petitioner is then notified to appear before a judge for final hearing. At the final hearing a representative of the immigration and naturalization service appears and recommends that the petition be granted or that it be denied.

If the court grants the petition, the petitioner takes an oath in open court forswearing all foreign allegiance and pledging allegiance to the United States; the judge then signs an order admitting him to citizenship. Thereafter the newly invested citizen receives an official certificate of naturalization. The fees established by law were as follows in 1951: $3 to the clerk of court at the time of filing the declaration of intention and $8 to the clerk of court at the time of filing the petition for naturalization. The latter fee included all charges through completion of the hearing before the naturalization court; no further fee was prescribed for the final hearing or for issuance of the certificate of naturalization.

A naturalized citizen acquires status equal to the native-born, except that he is not eligible to become president of the United States. However, even after naturalization is finally granted, it may be revoked through a judicial proceeding. The statute authorizes such revocation only if the naturalization was induced by fraudulent misstatements or was illegally granted (*e.g.*, misstatements relating to entry into the United States or to criminal record). The supreme court insisted upon strong evidence of irregularity before any naturalization might be cancelled and declared that such revocations would be sanctioned only if there was clear, unequivocal and convincing proof that the naturalization was improperly awarded (*Schneiderman* v. *United States*, 320 U.S. 118 [1943]).

Other Forms of Naturalization.—Another method of acquiring citizenship is by derivation through a husband or parent. Prior to Sept. 22, 1922, marriage to a U.S. citizen or the husband's naturalization conferred U.S. citizenship upon an alien wife. The Cable act of Sept. 22, 1922, abolished the joint citizenship of husband and wife and enabled a wife to choose her own nationality. Citizenship status previously acquired, however, was not affected.

Prior to the Nationality Act of 1940 a child under 21 years of age acquired U.S. citizenship through the naturalization of either parent while he resided in the United States or if he subsequently commenced to reside in the United States prior to his 21st birthday. After Jan. 13, 1941, the effective date of the Nationality Act of 1940, such transmission of citizenship could not occur after the child had attained the age of 18 years. In addition, derivation was to take place only if both parents became citizens, unless one parent was dead or there had been a divorce or legal separation, in which event the naturalization of the parent having legal custody would suffice.

A person who has acquired U.S. citizenship by derivation may apply to the commissioner of immigration and naturalization for a certificate recognizing that status. The fee for this application in 1951 was $5. Upon presentation of proof establishing a valid claim to U.S. citizenship, the commissioner issues a certificate of citizenship to the applicant.

Congress also may grant citizenship by special legislation. In some instances, so-called private bills have been enacted conferring citizenship rights upon named individuals. Much more common has been the award of collective naturalization to large groups of noncitizens, particularly the inhabitants of U.S. territories and possessions.

The nationality status of the inhabitants of certain acquired territories was fixed by the treaty-making power of congress. Statutes have from time to time effected collective naturalization either prior to or upon the admission of territories to statehood. Such action was taken in territory acquired under treaties concluded with Great Britain (territory of Michigan, 1794, 8 Stat. 116), France (Louisiana, 1803, 8 Stat. 200), Spain (Florida, 1819, 8 Stat. 252), Mexico (Guadalupe-Hidalgo, 1848, 9 Stat. 922; Gadsden, 1853, 10 Stat. 1031), Russia (Alaska, 1867, 15 Stat. 542) and Denmark (Virgin Islands, 1916, 39 Stat. 1706).

In the absence of definite treaty stipulations, citizenship has been conferred upon inhabitants of acquired territory by legislative enactments. In this category were the Hawaiians (act of April 30, 1900, 31 Stat. 141), Puerto Ricans (sections 5 and 5[a], act of March 2, 1917, as amended; section 202, Nationality Act of 1940), Virgin Islanders (act of Feb. 25, 1927) and Guamanians (act of Aug. 1, 1950, 64 Stat. 385). Finally, United States citizenship was conferred collectively through the political incorporation of the original states into the United States; in the case of the state of Texas, upon its annexation and direct admission into the union; and upon American Indians born in the United States through special legislation on June 2, 1924.

Full status as U.S. citizens, however, was not conferred on all the inhabitants of U.S. territorial possessions. Complete citizenship rights were extended to inhabitants of Alaska, Hawaii, Puerto Rico, the Virgin Islands and Guam; but the natives of other possessions such as American Samoa were regarded as noncitizen nationals of the United States, entitled to U.S. protection but not to full citizenship status.

COMMONWEALTH OF NATIONS

United Kingdom.—In 1844 Great Britain adopted legislation which authorized for the first time the naturalization of aliens as British subjects. Previously aliens could acquire British allegiance only through a private act of parliament or through the grant of letters of denization by the crown. After 1844 the latter processes were invoked only in rare cases. One such instance occurred when Lord Reay succeeded to a Scottish peerage in 1877 and was naturalized by an act of parliament. The process of denization fell into disuse because denizens were not granted full rights as British subjects.

The British Nationality act, 1948, which became effective Jan. 1, 1949, drastically revised earlier concepts of British nationality. It abolished the previously recognized status of common British nationality throughout the empire and recognized separate citizenship status for the United Kingdom and colonies and for each of the commonwealth nations; namely, Canada, Australia, New Zealand, the Union of South Africa, Newfoundland, India, Pakistan, Southern Rhodesia and Ceylon. Every citizen of the United Kingdom and colonies and of each of the other constituent nations of the commonwealth consequently acquired the status of a British subject, and was also referred to as a commonwealth citizen. Following enactment of the British Nationality act, 1948, Newfoundland became a province of Canada and was governed by the Canadian Citizenship Act of 1946. Citizens of the Republic of Ireland were no longer regarded as British subjects.

Under the British Nationality act, 1948, a noncitizen of the United Kingdom and colonies generally could acquire such status either through registration or naturalization. Both processes are entirely administrative and are entrusted to the discretion and control of the secretary of state, whose discretion in passing upon applications generally is absolute and unqualified. He may, with or without assigning any reason, grant or withhold any such registration or naturalization for any reason he deems conducive to the public good. His decision on any such application is not subject to appeal or review in any court.

Persons in the following groups may be registered as citizens of the United Kingdom and colonies upon application made in the prescribed manner to the secretary of state: (1) citizens of the Commonwealth of Nations or Ireland ordinarily resident or in crown service in the United Kingdom; (2) noncitizen women who marry citizens of the United Kingdom and colonies and who take an oath of allegiance to the British crown; (3) minor children of any citizen of the United Kingdom and colonies, upon application filed by the parent or guardian; (4) in such special circumstances as the secretary of state thinks fit, any other minor may be registered as a citizen of the United Kingdom and colonies.

The second major process for acquiring status as a citizen of the United Kingdom and colonies is through naturalization, which also is accomplished ordinarily upon application to the secretary of state in the prescribed manner. The naturalization application may be made by an alien or by a British protected person (a citizen or resident of a protectorate, protected state, mandated territory or trust territory). Upon satisfying the secretary of state that he meets the established requirements such applicant is granted a certificate of naturalization and, on taking an oath of allegiance to the British crown, he becomes a citizen of the United Kingdom and colonies by naturalization from the date on which the certificate was granted.

The following qualifications must be met by an applicant for naturalization: (1) he must have resided or been in crown service in the United Kingdom for at least 12 months immediately preceding the date of the application; (2) he must, in addition, have resided for specified periods aggregating at least four years in the United Kingdom or its colonies; (3) he must be of good character; (4) he must have sufficient knowledge of the English language; (5) he must intend to reside in the United Kingdom or its colonies or to perform crown or other specified service in the United Kingdom or its colonies. In special cases the secretary of state may waive or modify the residence requirements. Any person whose status as a citizen of the United Kingdom and colonies is in doubt may be granted a special certificate of naturalization by the secretary of state, and such certificate may declare that it is issued for the purpose of quieting such doubts. A certificate of naturalization granted for this purpose is conclusive evidence that the recipient was a citizen on the date of its issuance, but does not preclude his establishing that he was a citizen at an earlier date. A certificate of naturalization does not become effective until the applicant takes an oath of allegiance.

A person who becomes a citizen of the United Kingdom and colonies by registration or naturalization is entitled to all the rights, powers and privileges and is subject to all obligations, duties and liabilities of a natural-born citizen of the United Kingdom and colonies and to all intents and purposes enjoys the status of a natural-born citizen. However, such a person may be deprived of his citizenship, through order of the secretary of state, for fraud, false representation or material concealment in procuring registration or naturalization. In addition, a naturalized citizen may be deprived of his citizenship through order of the secretary of state on any one of the following grounds: (1) disloyalty, before or after the naturalization; (2) unlawful communication with or assistance to an enemy in time of war; (3) conviction and sentence in any court of certain serious crimes within five years of the naturalization; (4) continuous residence in foreign countries, except under certain specified conditions, for seven years after the granting of the certificate. The secretary of state may also revoke the naturalization of a citizen of the United Kingdom and colonies who is deprived of his citizenship in any of the commonwealth nations or in Ireland on grounds that are substantially similar to those mentioned above.

In no case does the secretary of state deprive any person of citizenship, even under the enumerated conditions, unless he is satisfied that it is not conducive to the public good that the person should continue to be a citizen of the United Kingdom and colonies. Before making an order revoking citizenship the secretary of state is required to give to the person affected written notice specifying the cause for the proposed action; in addition, such persons generally may demand a hearing before a committee of inquiry before any final action is taken.

The citizenship status of alien women married to British subjects has been treated differently at different times. The original common-law doctrine regarded a woman's citizenship as independent from that of her husband, and an alien woman did not gain British nationality or lose her native citizenship upon her marriage. The act of 1884 provided for the first time that an alien woman acquired British nationality upon marriage to a British subject. Thereafter, and until 1933, the statutes directed that the wife of a British subject should be deemed a British subject. This was modified by the act of 1933, which provided that when a certificate of naturalization was granted to an alien, his wife did not become a British subject unless she elected to accept British nationality. The original common-law concept was fully reinstated by the British Nationality act, 1948, so that after Jan. 1, 1949, an alien woman married to a citizen of the United Kingdom and colonies did not automatically acquire her husband's citizenship. She could become a citizen of the United Kingdom and colonies, if she desired such citizenship, only by applying for registration, in the manner previously described. The minor children of naturalized citizens likewise might become citizens of the United Kingdom and colonies through registration, upon application made by a parent or guardian.

British Colonies.—As previously indicated, the British colonial possessions were joined with the United Kingdom for the purpose of determining a common citizenship status in the United Kingdom and colonies. The authority of the secretary of state in granting registration or naturalization as a citizen of the United Kingdom and colonies and in revoking such citizenship status is reposed in the governor of any colony, protectorate or United Kingdom trust territory, whose actions generally are subject to the approval of the secretary of state.

Commonwealth Nations.—Completing a process inaugurated on a limited basis in 1914, the British Nationality act, 1948, recognized separate citizenship privileges for each of the countries in the Commonwealth of Nations and confirmed in addition the authority, without any limitation, of each of such countries to enact laws defining its own citizenry. As previously stated, the citizens of each such nation—Canada, Australia, New Zealand, the Union of South Africa, Newfoundland, India, Pakistan, Southern Rhodesia and Ceylon—were designated as British subjects or as commonwealth citizens. It has already been noted that Newfoundland became a province of Canada after enactment of the British Nationality act, 1948, and thereby became subject to Canadian laws.

The nationality laws adopted in each of the commonwealth countries must be consulted in order to determine citizenship status in those countries. Typical of such laws was the Canadian Citizenship act, 1946, which became effective Jan. 1, 1947. Indeed, the enactment of the Canadian law doubtless was an important factor in the subsequent revision of the British statute, which ultimately was enacted as the British Nationality act, 1948.

Under the Canadian statute, naturalization became essentially a judicial function. An executive officer, the secretary of state, was entrusted with broad administrative responsibilities in relation to that process. This division of responsibility thus resembled the system prevailing in the United States.

An applicant for naturalization must meet the following qualifications: (1) he must have filed a declaration of intention in the office of the clerk of court not less than one year nor more than five years prior to the date of final application; British subjects and spouses of Canadian citizens are exempt from this requirement; (2) he must have been lawfully admitted to Canada for permanent residence; (3) he must have resided continuously in Canada for one year immediately prior to the application and generally must also establish residence in Canada for a further specified period of not less than four years; applicants with specified military service and wives of Canadian citizens are exempt from this latter residence requirement; (4) he must be of good moral character; (5) he generally must have an adequate knowledge of either the English or the French language; (6) he must have an adequate knowledge of the responsibilities and privileges of Canadian citizenship; (7) he must intend to reside permanently or to enter public service in Canada.

Naturalization applications are filed and posted in the office of the clerk of court. After a three-month waiting period, during which any person may file objections, the applicant must personally appear before the court for an examination and must produce such evidence as the court may require. The court determines whether the applicant has satisfied the prescribed requirements. If the court orders that naturalization shall be granted, its decision is transmitted to the secretary of state together with the application and other relevant documents.

The certificate of citizenship is issued by the secretary of state to any person whose application has been granted by the court. However, if the secretary of state questions whether such application was properly approved he may refer it to the court for a rehearing, but the court's decision on such rehearing is final and conclusive.

The marriage of an alien woman to a Canadian citizen does not change her nationality status. The law recognizes her right to control her own nationality status. She may acquire Canadian citizenship through naturalization upon her own application, but provision is made for some relaxation of the normal requirements on her behalf. A certificate of citizenship may be issued to a minor child of a naturalized citizen upon application made by his parent.

The secretary of state may grant a certificate of citizenship to any person whose status as a Canadian citizen is in doubt, and the certificate may specify that it is granted for the purpose of quieting such doubts. No certificate of citizenship can become effective, except in the case of a minor under the age of 14 years, until the applicant has taken the prescribed oath of allegiance.

Naturalization may be revoked upon order of the secretary of state for any of the following reasons: (1) unlawful communication with or assistance to an enemy in time of war; (2) fraud, false representation or material concealment in procuring naturalization; (3) residing outside Canada for a period of six years following the naturalization; (4) disloyal acts or speech outside Canada, or, if in Canada, conviction of treason or sedition.

The secretary of state must give advance notice to the naturalized person concerning the proposed revocation and must afford him an opportunity to request that the case be referred for a hearing. If such hearing is requested it is held before a commission of inquiry or, in specially designated cases, before a court. Revocation of a naturalized person's citizenship generally does not terminate the Canadian citizenship derived through him by his wife and minor children unless specially directed or unless the wife of such person files a declaration renouncing her Canadian citizenship or her status as a British subject.

The Canadian Citizenship act also provided specifically that a Canadian citizen is a British subject; that a naturalized citizen shall have full equality with a natural-born Canadian citizen; and that a citizen of any country of the British Commonwealth other than Canada shall be recognized in Canada as a British subject.

OTHER COUNTRIES

Virtually every nation has some provision for the naturalization of aliens. Most countries entrust the authority to grant naturalization to executive officers. In this group in 1951 were: Afghanistan, Albania, Algeria, Australia, Austria, Belgian Congo, Belgium, Bolivia, Brazil, Bulgaria, Chile, Costa Rica, Dominican Republic, Ecuador, Egypt, Finland, France, Germany, Greece, Guatemala, Haiti, Honduras, Hong Kong, Hungary, Iceland, Iraq, Italy, Japan, Madagascar, Monaco, Morocco, the Netherlands, New Zealand, Nicaragua, Norway, Palestine, Panamá, Paraguay, Poland, Portuguese East Africa, Rumania, Salvador, Siam, Spain, Sweden, Switzerland, Syria, Tunisia, Turkey, the Union of South Africa, the U.S.S.R., Uruguay, Venezuela and Yugoslavia.

In still other countries naturalization is granted by the legislature, although in some of these executive officers perform coordinate or auxiliary functions. In 1951 these included Belgium, Bolivia, Paraguay, Rumania, Salvador and Uruguay.

In Belgium and Uruguay the legislature, the executive branch and the judiciary each might award naturalization. Other nations in which naturalization remained a judicial function in 1951 included Algeria, Argentina, Bulgaria, Liberia, Mexico and Spain.

Naturalization laws of the various countries vary as to the requirements for age, residence, eligible classes and other basic qualifications and procedures. A collection of the naturalization laws of each country is found in R. W. Flournoy, Jr., and M. O. Hudson (eds.), *Collection of Nationality Laws of Various Countries, as Contained in Constitutions, Statutes and Treaties* (1929). Some of the important requirements of such laws were summarized in *Research in International Law* (1929), published as special supplement to *American Journal of International Law*, 23:83–100.

Luella Gettys, *The Law of Citizenship in the United States* (1934). (E. G. H.)

NATURALIZATION OF PLANTS AND ANIMALS,

in the broad sense, is a term applied to the fact that plants or animals may be introduced, artificially or naturally, into a country with a climate the same as or different from that of their original habitat, and may successfully propagate there. What would come to the same thing is the successful persistence and propagation of plants and animals in a country whose climate has undergone some notable change, such as would be involved in the setting in of an ice age or a period of aridity. In this broad usage the term naturalization is practically synonymous with acclimatization (*q.v.*).

But in its narrow usage naturalization means a process by which organisms are changed in the course of generations in adaptation to new climatic conditions in the same or in another country. This usage implies the theoretical postulate of racial adaptation to withstand climatic influences which were at first more or less unfavourable. The establishment of the adaptation might be interpreted by some along Lamarckian and by others along Darwinian lines, and this raises additional theoretical questions.

Thus some investigators, *e.g.*, G. M. Thomson, who find little evidence of acclimatization in the strict sense, prefer to keep the term naturalization, which expresses an indisputable fact that organisms may thrive well when taken to another and in some respects different country.

Effects of Naturalization.—When plants and animals get a footing in a new and different country, what changes may be looked for? (1) There is often a marked increase in the number of individuals in a given area, as is illustrated by the multiplication of the rabbits in Australia, or of greenfinches and skylarks in New Zealand. The reason is twofold: favourable conditions, such as abundant food, may increase the rate of multiplication, and there may be an absence of the enemies and other checks which kept the numbers down in the old country. There have been some costly verifications of the numerical increase that is apt to follow naturalization, as in the familiar case of rabbits in Australia and New Zealand.

(2) Another consequence that has been repeatedly noted is increase in individual size and perhaps vigour. The new conditions prove unusually stimulating. Speaking of plants introduced into New Zealand, G. M. Thomson writes: "Water-cress—a plant of two to four feet in length in European waters—grew in some streams to a length of from 12 to 14 ft., and with stems as thick as one's wrist." This riotous exuberance is due positively to the stimulating conditions of the new territory, and negatively to the absence of the previous checks.

The popular interpretation of the rapid spread of introduced plants, *e.g.*, "weeds," in new countries, is that they come from places where the struggle for existence is keener and where they have therefore become particularly efficient. According to John Christopher Willis, "the real explanation, in all but a very few doubtful cases, is that their spread is due to change of conditions. This has usually been effected by man, who has often altered, or even destroyed, the conditions under which many societies of plants formerly flourished, thus giving a fair field to those newcomers that were suited to the new circumstances."

(3) Many naturalists have concluded that the lessening of the stringency of natural selection after transport to a new country allows an increase in the number of varieties, and the survival of peculiar forms, which would be speedily eliminated in the original environment. Thus, if there are few enemies, one might expect more numerous conspicuous variants, such as albinos. Here the careful work of G. M. Thomson is of great value. In 1891, he concluded that conspicuous colour variations were on the increase

among the rabbits introduced into New Zealand, and also among introduced birds like sparrows, thrushes, blackbirds, skylarks and starlings. Thirty years later he definitely withdrew this conclusion, the fallacy being that he was at first so busy looking for anomalous characters that he met with many, and unconsciously exaggerated the ratio of their occurrence. But inquiry must be made in other fields to see whether there is nothing to be said for the old view.

(4) So many naturalizations have been effected in different parts of the world that one would expect to find it easy to collect instances of change of habit; but there seems to be a strong conservative tendency among animals introduced into new haunts. When domesticated animals are transported to a wilder country there is sometimes an interesting individual rehabilitation of a long lost ancestral trait. Thus cows taken from Scotland to wilder conditions in California have been known to hide their calves in the thicket when they went to graze in the open. Sometimes, however, something novel occurs. Thus, sheep in New Zealand have shown in some places the novel habit of stripping off long pieces of bark from the gaya trees. On the whole it seems that change of habit in consequence of naturalization is infrequent and very gradual.

(5) Some types are quickly at home in a new country, but do not show external change. Horses, rabbits, rats, sparrows and fowls are usually somewhat indifferent to change of climate, while a tough animal like the yak of the Tibetan mountains refuses to thrive below a certain altitude.

Many facts confirm the suggestion that the success or failure of attempted naturalization may depend on inconspicuous constitutional peculiarities. Thus G. M. Thomson notes for New Zealand that the greenfinch and the chaffinch have thriven remarkably, while the allied linnet has failed. "The reasons for these failures are often so obscure that no plausible explanation has yet been given."

A hint of the frequent subtlety of conditions may be found in cases where the attempted naturalization of a plant fails, as of heather in Ceylon, because the associated root-fungus or mycorrhiza will not grow.

(6) When an organismal change directly induced by some change in environment, nutrition or habit, takes such a grip that it persists after the inducing conditions have ceased to operate, it is called a modification, or less conveniently, an individually acquired character. There seem to be some climatic modifications, and the following may be mentioned: (*a*) An Englishman who works half his lifetime under a tropical sun may become so tanned that the deposit of melanin pigment in the skin does not disappear during all the years in which he enjoys his pension at home. Of course it must not be inferred that the blackness of the Negro's skin was directly produced in this way by the tropical sun. (*b*) Karl Naegeli brought some Alpine plants to the Botanical garden at Munich, and there many of them became in the first year so much modified that they were hardly recognizable as the same species. Their descendants in the garden were also quite different from the Alpine originals. Thus the small hawkweeds (*Hieracium*) became large and thickly branched with abundant blossoms. The modifications were very striking, and in some cases many generations were observed—even for 13 years. The reappearance was probably due to the fact that the original modifications were directly reimpressed on each successive crop, for when the plants were removed from the rich garden to poor, gravelly soil, the acquired characters gradually disappeared, and the plants exhibited once more the original Alpine characters. There was no convincing evidence of hereditary entailment.

It is important not to think of these matters too simply. Thus, as Richard B. Goldschmidt points out, the normal development of particular characters, such as general growth and pigment formation, has been "harmonized" for a definite environment. But they have different temperature coefficients, and novel conditions may throw them out of harmony. Moreover, modifications resulting from climatic change must not be thought of as necessarily beneficial. Thus some Lepidoptera tend to melanism in the cold, and others at high temperatures, without there being any demonstrable advantage in either case.

(7) If evidence could be obtained of the hereditary entailment of climatic modifications, this would serve as a basis for a Lamarckian theory of acclimatization. It is necessary to inquire afresh whether there are any facts supporting the Lamarckian interpretation. Bordage records some observations on peach trees (*Prunus persica*) grown from seed of European origin sown in Reunion. For ten years or so the trees shed their leaves as in Europe. Later on, after 20 years, a considerable degree of evergreenness was exhibited. There was no bare period. When seeds of these partial evergreens were sown in the lowlands they grew into trees verdant throughout the year, but the same was true of seeds sown in certain mountainous districts with a considerable degree of frost. They also grew up into young peach trees which were also evergreen. But European seeds sown in similar situations developed into ordinary deciduous trees. This is a peculiar case and may be interpreted as follows: The original imports underwent a gradual constitutional change—some modification of their metabolism; this might affect the constitution of the seed during the period when it was still part and parcel of the parent's body. The change in the metabolism might result in the affected seeds developing into evergreens, though the direct environmental influence would work in the opposite direction. It is unfortunate that the observations were not carried further.

A famous case, often referred to, is that of the feral horses of the Falkland Islands, which Charles Darwin studied on his "Beagle" voyage (1833). He says that the horses and also the cattle were introduced by the French in 1764. Whereas the cattle are large, the horses are small, and Darwin speaks of them as "having degenerated." "They have lost so much strength that they are unfit to be used in taking wild cattle with the lazo: in consequence, it is necessary to go to the great expense of importing fresh horses from the Plata. At some future period the southern hemisphere probably will have its breed of Falkland ponies, as the northern has its Shetland breed." Darwin regarded the degeneration of the Falkland Islands horse as due to the humid climate and the lack of suitable food, but it is difficult to believe that marked changes were effected between 1764 and 1833. It would be necessary to know more about the horses originally imported.

Various statements have been made in regard to changes brought about in the hair of sheep, goats, cattle, sheep dogs and even cats, when these animals are taken to a more rigorous climate. It is said that the fur becomes longer and thicker, which would be a useful adaptation. But there is a lack of precision in these statements, and a regrettable absence of measurements. It would be useful to know what additions were made to the coat after the climatic change; whether the offspring, exposed to the cold from birth, showed further additions; and the character of the fur in the grand-offspring. As regards modifications, no inference can be drawn from the occurrence of adaptive peculiarities, unless the history is known.

On the whole we are forced to the conclusion that the evidence of the heritability of climatic modifications is unsatisfactory.

Naturalization in the Past.—All the world over there are instances of related species flourishing under different climatic conditions, and few evolutionists have any hesitation in regarding these as the outcome of divergent evolution. It may be recalled that while Darwin did not think much of man's achievements in naturalization, he had no doubt as to nature's powers in this direction.

Three saving-clauses should be kept in mind: (*a*) when two nearly related species are thriving in climatically different surroundings, it should not be taken for granted, as it usually is, that all their differences are now part and parcel of the inheritance. Some of the differences may be modificational, hammered on each successive generation in the course of development. There is need for more experimental study of species. (*b*) There has been a tendency to strain the interpretation of specific characters as adaptive to particular conditions of life, such as those implied in climate. Many characteristics separating related species in different localities may be reasonably interpreted as climatic

adaptations, but each case should be carefully judged on its merits. (*c*) When a species is extending its range in consequence perhaps of increasing numbers, the factor of isolation may come into operation, say in the form of a river or a watershed, and variations may be separated off which have no particular relation to the new territory or climate in which the leaders of the advance find themselves. Thus new species may arise by the physical segregation of diversely varying contingents of an advancing army, till the climatic difference itself may become an isolating factor.

Accepting, with these saving-clauses, the idea of naturalization, we must now ask how it may have been effected. The Lamarckian answer involves the postulate of the transmissibility of modifications, especially of functional modifications; and the evidence of this, summed up by Paul P. R. Kammerer (1924) and by Ernest William MacBride (1924), appears inconclusive. The interpretation which seems to involve fewest assumptions is that of Darwin. In discussing naturalization (1868), Darwin laid most emphasis on the natural selection of spontaneous variations. As to these variations he expressly says "there is no evidence that a change in the constitution of the offspring necessarily stands in any direct relation with the nature of the climate inhabited by the parents." In regard to selection he lays emphasis on two points: (*a*) the organism's power of resistance to difficult conditions in the new climate, and (*b*) some useful change in the period of reproduction, such as earlier flowering and fruiting.

To Darwin's interpretation an addition may be suggested. It is conceivable that the climatic peculiarities may affect the metabolism of the organism through and through, and may thus serve as stimuli to the variability of the germ cells. If the climatic peculiarity should induce (*a*) an adaptive modification in the body of the organism and (*b*), at the same time, a variation in the germ cells which finds expression as a similar new character in the offspring, the phenomenon is called "parallel induction." It must be distinguished theoretically from the transmission of a somatic modification; it is a change induced in the germ cells along with, but not through, the bodily modification (*see* EVOLUTION, ORGANIC).

But it is possible that climatic peculiarities may penetrate into the germ cells and affect them without producing any modification in the body. Thus W. L. Tower subjected full-grown potato beetles (*Leptinotarsa*) to peculiar conditions of temperature and humidity during the time when the eggs were maturing, and found that "mutations" occurred in a certain proportion of the offspring. The parents were not affected, having passed the plastic stage; and some of the eggs were not affected at all. Moreover, the same environmental peculiarity, analogous to a climatic change, did not always evoke the same mutation. Some of the mutations in colour and markings were very striking; others affected minute details of structure. In subsequent generations there was no reversion. This case is of particular interest in connection with naturalization, for the artificial environmental conditions, effected in large steel and glass cages, were comparable to different climatic conditions in which different species of potato beetle live.

By Hermann J. Muller in particular it has been shown that an exposure of the germ cells of the fruit-fly (*Drosophila melanogaster*) to appropriate doses of X-rays is followed by numerous mutations, which often breed true. This experimental irradiation illustrates the possible action of the environment as a variational stimulus. A mutation following a climatic change might have this origin. As August Weismann said many years ago (1904): "It does not seem impossible that the climate may have a variational influence upon certain determinants of the germ-plasm, for we have already seen that the influence of cultivation may incite plants and animals to hereditary variations, and that slowly increasing disturbances in the equilibrium of the determinant system may thereby be produced, which may suddenly find marked expression as 'mutations.' But there is little probability that *adaptations*, that is, transformations corresponding to the altered climate, can arise in this way!" The meaning of this last sentence is that Weismann believed these adaptations were the outcome of the prolonged natural selection of fluctuating variations in the germ-plasm.

The Darwinian theory, as applied to naturalization may be briefly resumed in more technical terms. In any species in any given environment there will be an observable percentage of variations from type in a given number of births, and these variations yield a curve of frequency or probable error. The steepness of the curve is a measure of the variability of the species. The aberrants on all sides are pruned off by selection. If the environment is changed, selection may no longer operate on the same axis as before, but may tend to prune off variations on one side of the mean more than on another. In the course of time, the apex of the curve, representing the type form, will shift to suit the new conditions, since more of the aberrants on the favoured side will live to reproduce.

Quite a separate question is this: that the new environment may increase the variability of the species, flattening the curve of probable error. The effect of this is that selection has more material to work with, and therefore attains its end more rapidly, although of the variations appearing as many will be unfavourable as favourable. A species in which there is little variation presents a greater inertia to the shifting effect of altered climatic conditions than a variable species. In the less variable species there will be relatively fewer favourable variations to mate with the type.

William Bateson's Silliman Lectures contain a valuable criticism of the somewhat facilely accepted views (*a*) that local and climatic varieties are adaptational, (*b*) that the influences of environment have directly led either to the production of these varieties or to their selective stabilization, and (*c*) that there is gradual transition—or mass transformation—from one species to another in response to climatic influences. Bateson lays much emphasis on the role of isolation and on the intrinsic character, *e.g.*, Mendelian dominance of the sporadic variations that are of frequent occurrence.

Of importance in connection with naturalization is Erwin Baur's study of cultivated snapdragons, especially *Antirrhinum majus*. He finds a frequent occurrence of small mutations, transmissible in Mendelian fashion, often showing themselves in "pure lines," and sometimes suggesting an enhancement of vigour, as when a mutant appears with deeper green in its leaves. According to Baur wild species of snapdragon, like garden races, have often arisen by the summation of small mutations (*see* EVOLUTION, ORGANIC; GENETICS OF POPULATIONS).

Change of Climate.—So far we have considered what may happen when organisms are naturalized, perhaps acclimatized, in a new and different environment. But similar biological problems are raised when we think of the changes that occur or have occurred in the fauna and flora of a country after some drastic alteration of the climate—toward aridity or humidity, toward markedly higher or lower temperature. To what extent have changes of climate functioned as factors in organic evolution?

(1) In extreme cases, as when a country is covered with glaciers, there may be an almost complete elimination of life, as happened over the greater part of Britain during the quaternary glacial periods.

(2) In less severe conditions the gradual setting in of unfavourable climatic conditions would exert a selective influence. Thus xerophytic plants would tend to survive when arid conditions encroached; quickly flowering and fruiting plants, entrenched below ground in winter, with reserves in rhizome and bulb, would tend to survive when the snow began to cover the ground for many months of the year. In a country becoming warmer there might be survival value in aestivation; in a country becoming colder the advantage might be with the hibernators. In scores of ways a gradual change of climate would sift the fauna and flora.

(3) Some animals able to move about for considerable distances and not too slowly would be prompted by climatic changes to shift their quarters. As the severity of the ice ages spread southward in Europe, many northern mammals came with it; thus remains of reindeer, lemming and arctic fox are found in deposits far to the south. As milder climates set in and the glaciers melted, the descendants of some of the arctic types, like reindeer and white fox, were able to trek for the north. Some, however, remained as refugees on the mountains, like the snow vole (*Microtus nivalis*) of the high Alps. Some of the true bird migrations may owe their origin in part to distant climatic changes such as those of the quaternary ice ages (*see* BIRDS, MIGRATION OF; MIGRATION OF ANIMALS).

(4) It is reasonable to suppose, though difficult to prove, that change of climate in a country induced important changes of habit. Thus Barrell and Richard Swann Lull have suggested that continental elevation and consequent aridity, especially in the Himalayan region, led in the Miocene or early Pliocene ages to a dwindling of the forested area where man's ancestors were at home. The alternatives

were to find other forests in warmer countries, as the present-day anthropoid apes did, or to be eliminated, or to come to earth and begin afresh on a new line of life. The last solution may have been of critical moment in the evolution of Hominoids.

(5) Climatic changes in a country may also have played an important part in punctuating the life history. A kind of variation which has not received adequate attention may be called "temporal." It includes alterations in the tempo, or rate, or rhythm of metabolic processes, or in the duration of particular phases in the life history. In vertebrate animals, at least, this might be brought about by variations (also, of course, requiring to be accounted for somehow) in the secretory activity of the ductless or endocrinal glands, the hormones of which serve now as accelerators and again as brakes. The life histories of many types differ from one another in the shortening or lengthening of particular arcs on the life curve or trajectory. Here is a kind of evolution to which climatic variations may have applied a frequent spur. Thus, when the rate of development was such that the life cycle could not be completed in the first summer, there would be a tendency to favour variations in the direction of interpolating a larval phase, as in insects, suited for an accumulation of reserves, a reduced intensity of life in cold weather, a diminished exposure of vulnerable surface, and so on. Opinions may differ in regard to particular cases, but it is a legitimate and instructive inquiry to associate temporal variations in the life curve with seasonal and with climatic periodicities.

The Arctic tundra is marked by a long dark winter of bitter cold and a short nightless summer of intense illumination, therefore it is reasonable to postulate a prolonged process of elimination as the climate changed—an elimination of those types which did not vary in the direction of quick-flowering and quick-fruiting, dying down in winter, dispensing with all but a little water and accumulating stores in underground parts.

Among the features of the life curve that may be tentatively associated with climatic changes, the following may be suggested—the length of the mammalian gestation and the season for giving birth; the periodicities of migrating birds; the interpolation of periods of winter sleep, rest, coma, lethargy and even de-differentiation. Every trajectory of life should be looked at in the light of the evolution of climates.

Often in the history of the earth a change toward great cold has involved severe elimination. In humid periods there tends to be abundant succulent fodder for browsing animals and extensive forests affording shelter. Diminution of moisture, if it does not go too far, favours the increase of grasses and of grazing animals. Aridity makes the forests shrink and prompts the search for new haunts. The times of quickening, the "expression-points" or "pulsations" of evolution, may often be correlated with climatic changes, chiefly in temperature and humidity, due sometimes to topographic, at others to general atmospheric, conditions. Behind these, again, lie larger factors still, such as shrinkages of the earth's crust.

Interaction of Endemic and Introduced Faunas.—The newcomers may destroy the indigenous or previously naturalized forms. Thus the mongoose, introduced into Jamaica, destroyed the indigenous "cane-rats" and the alien ship-rats. The introduced animals may become so numerous that they make life difficult for their predecessors though they do not actually devour them. They may, for instance, seriously reduce the food supply, but they may be prejudicial with varying degrees of directness. When the brown rat (*Rattus norvegicus*) found its way to Britain in the early 18th century, it proved itself hardier, more plastic and more fecund than the black rat (*Rattus rattus*), with the result that in 50 years the latter was almost exterminated except in places where it was continually being reintroduced by ships.

Sometimes the influence is more subtle. Thus, an extension of squirrels into an area may be followed by the reduction of the number of wood-pigeons. There does not seem at first sight any intersection of the two lives; but squirrels, though largely vegetarian, cannot resist killing and eating the young squabs in the nest; and this is, from the farmer's point of view, a useful check.

The introduction of an animal into a new country may involve the introduction of its parasites; thus rats harbour rat-fleas which disseminate bubonic plague, and it is from rats that pigs, and thence men, become infected with the disease of trichinosis, which is due to *Trichinella spiralis*, a small nematode. Many of these interrelations are very subtle; thus the problem of getting rid of Bilharziasis in Durban is easier than it is in Japan, for in South Africa the only host of the adult parasite is man, whereas in Japan it also occurs in cattle. In both countries the juvenile stages are spent in various water snails, and their abundance or rarity in turn is correlated with the presence of water birds which feed upon them and of water plants on which they feed.

The Case of New Zealand.—The peculiar value of New Zealand in reference to the problems of naturalization is that the introduction of the majority of the nonindigenous larger animals is more or less definitely known; *see* G. M. Thomson's masterly study: *The Naturalization of Animals and Plants in New Zealand* (Cambridge, 1922).

Apart from two species of bats, it is doubtful if there are any indigenous mammals in New Zealand; but 48 species have been introduced, 44 purposely and 4 accidentally. The 4 comprise the mouse and 3 rats, one of which, the Maori rat (*Mus exulans*), disappeared after European settlement began. Twenty-five of the 48 species of mammals are at present well-established and feral in certain districts—wallaby, common opossum, sooty opossum, pig, horse, various deer, cattle, sheep, goats, chamois, cat, ferret, stoat, weasel, black rat, brown rat, mouse, rabbit, hare and hedgehog.

About 130 species of birds have been purposely introduced into New Zealand since the date of Captain James Cook's landing, and 24 have become truly wild, such as mallard, pheasant, pigeon, skylark, thrush, blackbird, hedge sparrow, rook, starling, Indian mynah, house sparrow, chaffinch, goldfinch, greenfinch and yellowhammer.

On the other hand, since 1868, nine species of birds have become either very rare or extinct, such as native crows, huia, native thrushes, the burrowing parrot *Stringops*, the native quail and the white heron. Others, once abundant, have been driven back into areas where there has not been much settlement. As to the causes, Thomson writes: "It must not be supposed that it is the introduced animals alone which have produced this effect, even though rats, cats, rabbits, pigs, cattle, stoats and weasels, as well perhaps as some kinds of introduced birds, have penetrated beyond the settled districts. It is largely the direct disturbance of their haunts and breeding-places, and the interference with their food supply, which has caused this destruction and diminution of the native fauna."

What is true for birds holds also for lower animals, from lizards to insects; but again the reasons are to be found in human intervention rather than in direct competition with newcomers. This is corroborated by the fact that there were some notable cases of increase after about the 1870s. Thus the bellbird has become abundant in the South Island, though scarce in the North Island; and the harrier has greatly increased, perhaps in relation to the abundance of young rabbits. The wax-eye or blight bird (*Zosterops coeruleus*) has apparently increased greatly since first recorded in 1832, perhaps in relation to the supply of animal food about houses and stockyards. The case of the long-tailed cuckoo (*Urodynamis taitensis*) is interesting as an illustration of the complexity of interrelations. It seems to have become increasingly numerous after the 1890s and this is attributed to the increase of small European birds, whose eggs and young it eats, and also to the food afforded in and about trout hatcheries.

Method of Naturalization.—What should man do when he wishes to naturalize a valuable plant or animal in a new and markedly different country? If trial has shown that naturalization is not easy, the transporter should work with those varieties which seem most likely to be suitable. Attention should also be paid to the quality of variability, for some stocks are much more fixed than others. It may be useful to transport individuals of the most promising stocks to some intermediate station, where selection may be made among the variations that continue to arise. Darwin noted that "Merino sheep bred at the Cape of Good Hope have been found far better adapted for India than those imported from England." (*Variation,* p. 305 [1868].) In cases where success in the new country seems to depend on the possession of a particular character, such as thick fur or woolly leaves, the variants selected would be those tending most markedly in that direction, but Mendelian methods might enable the breeder to "graft" on to the tentative imports the desirable character in question if it existed elsewhere in an allied race. By more systematic selection of heritable variations and by Mendelian hybridizing, it seems likely that the process of acclimatization might be greatly extended and hastened.

Willis notes that man has often failed in naturalization by attempting too much abruptly. Learning from failure, he is now trying gradual transitions, "as in the way he has treated Liberian coffee in Java, taking the seed of successive generations a few score yards higher up each time, till he has persuaded the tree to do well at a much higher elevation than that to which it is naturally suited." The attempts to acclimatize the beautiful *Cyperus papyrus* in the Ceylon Botanic garden failed when seed from Europe was used, but seed from Saharanpur in India succeeded at once. The moral is that man must moderate his impatience and take a hint at least from nature's operations by small steps throughout long periods.

NATURAL LAW, in science, means the formulation of some uniform characters or connection of things or events; but it is frequently used for the uniformity itself as it exists in natural phenomena. Any such uniformity may be called a natural law; *e.g.*, all the laws formulated in physics and chemistry. On the other hand the term "law of nature" is sometimes restricted to irreducible or ultimate laws (like the law of gravitation), as distinguished from derivative laws (like Johann Kepler's three laws of planetary motion). *See* LAW (in science, etc.); SCIENTIFIC METHOD; J. S. Mill, *System of Logic* (1875, etc.).

NATURAL RESOURCES, CONSERVATION OF: *see* FISH AND WILDLIFE SERVICE; GAME RESERVES; NATIONAL PARK SYSTEM, THE; WILDLIFE RESERVES.

NATURE. In the history of philosophy the term "nature" has been used in various inconsistent senses, corresponding more or less to the different attitudes which thinkers adopted toward the material part of the world in relation to the rest. The early Greek thinkers known as the hylozoists were not conscious of any fundamental difference between mere matter, on the one hand, and life and consciousness on the other. For them, accordingly, "nature" (φύσις) included everything that is, or that ever came into being (Latin *natura* from *nasci*, to be born). Later on the Sophists contrasted the "natural" with the "conventional," or that which anything is originally and what it is as the result of human intervention. In this way they and others described as conventional not only law and custom, but even colours and other secondary qualities in contrast with matter and motion. Thus the "natural" came to be contrasted with the "human" and, of course, the superhuman. Then owing partly to the influence of Plato, and partly to the influence of Christianity, it became customary to set body and mind (to say nothing of Platonic "Ideas," the "Good," and God, etc.) sharply against one another, and to identify "nature," or "the world and the flesh," with the material part of the universe only. This is one of the reasons for the rather common tendency to identify "naturalism" with materialism. With the Renaissance there came a more friendly attitude toward the material world, and the older Greek conception of "nature" was revived. And so in due course we find in Giardano Bruno and Benedictus de Spinoza, among others, the term "nature" used in the all-comprehensive sense of the entire universe—a sense which, of course, excluded the possibility of anything "supernatural." Hence the other meaning of the term "naturalism," merely as the antithesis to "supernaturalism" in science and philosophy. For the conception of nature in recent science *see* A. N. Whitehead, *The Concept of Nature* (1920).

NATURE RESERVES: *see* WILDLIFE RESERVES.

NAUGATUCK, a borough of New Haven county, Connecticut, U.S., land area 16.6 sq.mi. on the Naugatuck river, 15 mi. N.W. of New Haven. It is served by the New York, New Haven and Hartford railroad, and there is an aviation field 6 mi. from the business district. Pop. (1950) 17,455; (1940) federal census, 15,388 (19.1% foreign born white). The principal public buildings, including a fine high school, are grouped around the central green. A mile to the north is the 18th-century Porter tavern, and 2 mi. S. is the Collins tavern (1810), a noted stopping place on the stage-coach route between New Haven and Litchfield. The manufacture of rubber goods (including 100,000 pairs of shoes and boots daily) is the leading industry, and one of the largest rubber-regenerating plants in the world is situated there. Other important products are chemicals, candies, malleable iron castings, copper floats, aircraft instruments, glass, mirrors, plastics, chains, cosmetic containers and drawn metal components. Naugatuck was the home of Charles Goodyear who in 1839 invented the process of vulcanizing rubber. The city's name is an Algonquin word meaning "one tree."

NAUHEIM or **BAD-NAUHEIM,** a watering place of Germany, in the *Land* of Hesse, situated on the northeast slope of the Taunus mountains, 24 mi. by rail N. of Frankfort-on-Main on the main line of railway to Cassel. Pop. (1939) 12,981. Nauheim, which was bestowed by Napoleon upon Marshal Louis Davout, became a town in 1854. From 1815 to 1866 it belonged to the electorate of Hesse-Cassel, but in 1866 it was ceded to the grand-duchy of Hesse-Darmstadt. Its thermal waters (84° to 95° F.), although known for centuries, were, prior to 1835, only employed for the extraction of salt. The waters, which are saline, strongly impregnated with carbonic acid, and to a less extent with iron, are principally used for bathing, and are specific in cases of gout and rheumatism, but especially for heart affections. Three smaller springs, situated outside the Kurpark, supply water for drinking. In 1899–1900 a new spring (saline) was tapped at a depth of 682 ft. Another attraction of the place is the Johannisberg, a hill 773 ft. high, overlooking the town.

NAUKRATIS, an ancient Greek settlement in Egypt. The site was discovered by Prof. W. M. Flinders Petrie in 1884, on the eastern bank of a canal, about 10 mi. W. of the present Rosetta branch of the Nile. In ancient times it was approached by the Canopic mouth, which was farther to the west. The identification of the site is placed beyond doubt by the discovery of inscriptions, with the name of the town, and of great masses of early Greek pottery. The site was excavated in 1884–86 by the Egypt Exploration fund, and a supplementary excavation was made by the British school at Athens in 1899. A list of the temples of Naukratis is given by Herodotus (ii, 178); they were the Hellenion, common to all the colonizing cities, and those dedicated by the Aeginetans to Zeus, by the Samians to Hera and by the Milesians to Apollo. A temple of Aphrodite is also mentioned by Athenaeus. Traces of all these temples, except that of Zeus, or at least dedications coming from them, have been found in the excavations, and another has been added to them, the temple of the Dioscuri. In addition to these temples, there was also found a great fortified enclosure, about 860 ft. by 750 ft., in the southeastern part of the town; within it was a square tower or fort. A portico of entrance and an avenue of rows of sphinxes was added in Ptolemaic times, as is shown by the foundation deposits found at the corners of the portico; these consisted of models of the tools and materials used in the buildings, models of instruments for sacrifice or ceremonies, and cartouches of King Ptolemy Philadelphus. David George Hogarth subsequently found traces of another great walled enclosure to the northeast of the town, together with pottery dedicated *τοῖς τῶν Ἑλλήνων θεοῖς*, and he claims with reason that this enclosure is more likely than the other to be the Hellenion.

Apart from the historic interest of the site, as the only Greek colony in Egypt in early times, the chief importance of the excavations lies in the rich finds of early pottery and in the inscriptions upon them, which throw light on the early history of the alphabet. There are clear traces of a settlement going back to the 7th century, including a scarab factory, and yielding fragments of early Greek pottery. It seems a fair inference that the makers of these were Greeks, and that they probably represent the early Milesian colony, settled here in the time of Psammetichus I.

NAULETTE, a large cavern on the left bank of the Lesse, which joins the Meuse above Dinant, Belgium. Here in 1866 Edouard Dupont discovered an imperfect human lower jaw, now in the Brussels Natural History museum. It is of a very apelike type in its extreme projection and that of the teeth sockets (teeth themselves lost), with canines very strong and large molars increasing in size backward. It was found associated with the remains of mammoth, rhinoceros and reindeer. The Naulette man is now assigned to the Mousterian Epoch.

See G. de Mortillet, *Le Préhistorique* (1900); J. Dechelette, *Archéologie*, vol. i, p. 281 (1912).

NAUMACHIA, the Greek word denoting a naval battle (*ναῦς*, ship, and *μάχη*, battle), used by the Romans as a term for a mimic sea fight. These entertainments took place in the amphitheatre, which was flooded with water, or in specially constructed basins (also called *naumachiae*). The first on record, representing an engagement between a Tyrian and an Egyptian fleet, was given by Julius Caesar (46 B.C.) on a lake which he constructed in the Campus Martius. In 2 B.C. Augustus, at the dedication of the temple of Mars Ultor, exhibited a naumachia between Athenians and Persians, in a basin probably in the *horti Caesaris*, where subsequently Titus gave a representation of a sea fight between Corinth and Corcyra. In that given by Claudius (A.D. 52) on the *lacus Fucinus*, 19,000 men dressed as Rhodians and Sicilians manoeuvred and fought. The crews consisted of

gladiators, condemned criminals, and in later times, volunteers.

See Games, Classical; Panathenaea; Rome: *Ancient City.*

NAUMBURG, a town in the *Land* of Saxony, Germany, the seat of the provincial law courts and court of appeal for the province and the neighbouring districts. It is situated on the Saale, near its junction with the Unstrut, 29 mi. S.W. from Halle, on the railway to Weimar and Erfurt. Pop. (1939) 36,310. In the 10th century Naumburg was a stronghold of the margraves of Meissen, who in 1029 transferred to it the bishopric of Zeitz. In 1564 the last bishop died, and the bishopric fell to the elector of Saxony. In 1631 the town was taken by Tilly, and in 1632 by Gustavus Adolphus. It became Prussian in 1814. The cathedral, a building in the Romanesque Transition style (1207–42), has a Gothic choir at each end, and contains some mediaeval sculptures. It is remarkable for its large crypt and its towers.

NAUNDORFF (or Naündorff), **KARL WILHELM** (d. 1845), French pretender, claimed to be the dauphin, Louis Charles son of Louis XVI and Marie Antoinette, who was announced as having died in the Temple in 1795.

Naundorff, who had arrived from nowhere in Berlin in 1810, with papers giving the name Karl Wilhelm Naundorff, in order to escape the persecutions of which he declared himself the object, settled at Spandau in 1812 as a clockmaker, and married in 1818 Johanna Einert. In 1822 he removed to Brandenburg, and in 1828 to Crossen, near Frankfurt. He was imprisoned from 1825 to 1828 for coining, though apparently on insufficient evidence, and in 1833 came to push his claims in Paris, where he was recognized as the dauphin by many persons formerly connected with the court of Louis XVI. Expelled from France in 1836, the day after bringing a suit against the duchess of Angoulême for the restitution of the dauphin's private property, he lived in exile until his death at Delft on Aug. 10, 1845, and his tomb was inscribed "Louis XVII, roi de France et de Navarre (Charles Louis, duc de Normandie)."

NAUPLIA, a town in the Peloponnesus, at the head of the Argolic gulf, the seaport of the plain in which Argos and Mycenae are situated, with several tombs of the Mycenaean age. A hero Nauplius took part in the Argonautic expedition; another was king of Euboea. In classical times it was of no importance, and Pausanias, about A.D. 150, found it deserted. The mythic importance of the town revived in the middle ages, when it became chief city of the Morea. It was captured in 1211 by Godfrey Villehardouin with the help of Venetian ships; a French dynasty ruled in it for some time, and established feudalism. In 1388 the Venetians bought Argos and Nauplia. In the wars between Venice and the Turks it often changed masters: given to the Turks in 1540, it was recaptured by Venice in 1686, and the Palamidhi hill overhanging the town was fortified. In 1715 it was taken by the Turks; in 1770 the Russians occupied it for a short time. The Greeks captured it during the War of Independence on Dec. 12, 1822, and it was the seat of the Greek administration till 1833, when Athens became the capital of the country. It is the chief town of the department of Argolis. Population is 7,600.

NAURU: *see* Pacific Islands.

NAUSICAA, in Greek legend, daughter of Alcinous, king of the Phaeacians in the island of Scheria (*Odyssey*, vi, 15–315, viii, 457). When Odysseus (*q.v.*) swam ashore to Scheria, he was found by Nausicaa, who supplied him with clothes and took him to her father's palace, where he was hospitably entertained.

NAUTCH, an Indian ballet dance (Hindostani *nach*). The nautch is performed by nautch girls, who scarcely move their feet, and the dance consists of swaying and posturing with the arms.

NAUTILUS, the name given by the ancient Greeks to a cephalopod mollusc, *Argonauta argo* (the paper nautilus). Carl von Linné, however, applied it as a scientific designation to another cephalopod, the pearly nautilus of eastern seas, and named the "nautilus" of the Greeks, *Argonauta.* The structure and zoological position of the pearly nautilus are discussed in the article Cephalopoda. It is represented at the present time by four species, which are restricted to the area between the Fiji and the Philippine Islands. It usually lives near the sea bottom at considerable depths, though at night it comes into shallow water where it is caught for food by the natives.

The paper nautilus (*Argonauta*) is found in practically all subtropical and tropical seas. Although it has been taken from depths of more than 500 fathoms it is characteristically found at the surface. It is placed along with a few other genera in a separate family of the Octopoda or eight-armed cephalopods. The genus is characterized by several very peculiar features. In the first place the male *Argonauta* is very much smaller than the female, the latter in certain cases being as much as 15 times the size of the male. Like the rest of the Octopoda the male *Argonauta* lacks an external shell, but the two dorsal arms of the female secrete a calcareous shell which is unique in the mollusc phylum. Its origin from the arms is unlike that of the shell of other molluscs which is developed from the mantle. Moreover this shell is used as a receptacle for the eggs and in it they are incubated until the young are hatched out.

NAUVOO, a city of Hancock county, Ill., U.S.A., on the Mississippi river about 50 mi. above Quincy. Pop. (1950) 1,242.

Nauvoo is the centre of a large grape and wine industry, and has a factory which manufactures blue cheese. An annual "grape festival" features a "wedding of the wine and cheese" similar to that held in Roquefort, France. "Commerce city" was laid out here in 1834 by Connecticut speculators; but the first settlement of importance was made by the Mormons (*q.v.*) in 1839–40; they named it Nauvoo, in obedience to a "revelation" made to Joseph Smith, and secured a city charter in 1840. The Mormons said the name was of Hebrew origin and meant "beautiful place"; Hebrew "naveh" means "pleasant." In 1844 its population was about 15,000, and a large Mormon temple had been built, but internal dissensions arose, "gentile" hostility was aroused, the charter of Nauvoo was revoked in 1845, two of the leaders, Joseph Smith and his brother Hyrum, were killed at Carthage, the county-seat, by a mob, and in 1846 the sect was driven from the state. Traces of Mormonism remain in the many old Mormon homes, including Prophet Joseph Smith's and Brigham Young's. Three years after the expulsion of the Mormons, Nauvoo was occupied by the remnant (about 250) of a colony of French Communists, the Icarians, who had come out under the leadership of Étienne Cabet (*q.v.*). For a few years the colony prospered, and by 1855 its membership had doubled. Each family occupied its own home, but property was held in common, all ate at the common table, and the children were taught in the community school. A proposal to revise the constitution resulted in rending the colony into two irreconcilable factions, and in Oct. 1856 Cabet with the minority (172) withdrew to St. Louis, Mo. Soon after the schism of 1856 those who had rebelled against Cabet began to prepare a permanent home in Adams county, Iowa. There too in 1879 the community split into two factions, the Young Party and the Old Party. Most of the Young Party removed to Sonoma county, Calif., and here early in 1884, formed the Icaria-Speranza community. All branches of the society ceased to exist after 1895. A state park commemorating the role of the Mormons and Icarians in Illinois history was dedicated in 1950.

NAVAHO, an Athabascan people in northern Arizona and New Mexico, situated between the various Pueblo Indians. They are first mentioned about 1630; they may have been met by the Spaniards before this without being distinguished from the

Apache. They are probably an Apache division in origin, specialized through contact with the Pueblos. Their territory comprises the heart of the prehistoric Pueblo area about Chaco canyon and other affluents of the San Juan river; but they never adopted the masonry houses, sedentary life, or, except to a limited extent, the agriculture of the Pueblos. For several centuries they raided these people and the Spanish-Mexican colonists, drove off their stock and gradually acquired herds of horses, cattle, goats and especially sheep, from which their living is still largely derived. They are noted for their blankets and silver work. Their great ceremonies last nine days. The Navaho are matrilineal, their 50–60 clans bearing the names of localities but being exogamous. Their houses are of stick and earth covered on a foundation of logs; they make very little pottery and basketry. The original population was probably only a few thousand; it is thought to have reached 9,000 in 1869 and was estimated at approximately 61,000 in 1947 by the bureau of Indian affairs.

NAVAL AND MILITARY SCIENTIFIC SOCIETIES. The *Royal United Service Institution*, first known as the *Naval and Military Library and Museum* (1831), became the *United Service Institution* in 1839, and was incorporated in 1860; its professional museum is housed in the banqueting hall at Whitehall; it publishes a *Journal* (1857 *et seq.*). The *Institution of Naval Architects* (1860) publishes *Transactions*, 4to, (1860 *et seq.*). The *Royal Artillery Institution* (1838), which issues the *Royal Artillery Journal*, is at Woolwich, and the *Institution of Royal Engineers* (1875), which issues the *R. E. Journal*, at Chatham. The *Navy Records Soc.* (1893) publishes works connected with the history of the British navy. CANADA: Toronto, *Military Inst.* INDIA: Simla, *United Service Institution.*

UNITED STATES: New York, *Military Service Inst.* (1878), *Journal* (1879 *et seq.*); *Soc. of Naval Architects and Marine Eng., Proc.* Annapolis, *U.S. Naval Inst.* (1873), *Proc.* Wash., D.C., *Am. Soc. of Naval Eng.* (1889), *Journal; Soc. of Military Eng.* (1919), *Military Engineer; Army Ordnance Assn.* (1920), *Army Ordnance; Am. NAVAL ARTICLES. The subject of navies generally is dealt with in the article NAVY AND NAVIES.

The navies of the various nations are dealt with under the name of each nation, but separate articles have been allotted to the various types of warships; *e.g.*, AIRCRAFT CARRIERS; BATTLESHIP; CRUISER; DESTROYER; FLEET AUXILIARY VESSELS; SUBMARINE.

Historical aspects are under NAVY AND NAVIES; GREAT BRITAIN; UNITED STATES; WORLD WAR I: *Naval;* WORLD WAR II: *The War at Sea;* while important operations or engagements, such as ARMADA; COPENHAGEN; CORONEL; DARDANELLES CAMPAIGN; DOGGER BANK; DUTCH WARS; FALKLAND ISLANDS, BATTLE OF; FIRST OF JUNE; FRENCH REVOLUTIONARY WARS; JUTLAND, BATTLE OF; NAPOLEONIC CAMPAIGNS; NAVARINO; NILE, BATTLE OF THE; QUIBERON; SAINTS, BATTLE OF THE; SEVEN YEARS' WAR; ST. VINCENT, BATTLE OF; TOULON; TRAFALGAR, are found under their appropriate headings. For a more general study of naval warfare, *see* articles on BLOCKADE; COAST DEFENSE; CONVOY; DOCKYARDS AND NAVAL BASES; FUELLING STATIONS; NAVAL STRATEGY AND TACTICS; SEA POWER.

Technical articles in addition to those dealing with each of the various types of ships include ANCHOR; ARMOUR PLATES; BUOY; CABLE; CAMOUFLAGE; CAPSTAN; CHRONOMETER; FIRESHIP; FLEET, NAVAL; FRIGATE; GALLEY; GUNNERY; LOG, MARITIME; MINES (NAVAL); ORDNANCE; PARAVANE; PILOTAGE; PILOTAGE LAWS; RANGE FINDERS; RULE OF THE ROAD AT SEA; SEAMANSHIP; SHIP; SHIPBUILDING; SHIPS' FIGUREHEADS; TORPEDOES; WASHINGTON TREATY.

Administration and personnel will be found dealt with under ADMIRAL; ADMIRALTY; CAPTAIN; COURT-MARTIAL; MARINES; MEDICAL SERVICE, NAVY; MIDSHIPMAN; PRESS GANG; STAFF, NAVAL; UNIFORMS.

NAVAL STORES, a trade name for the products derived from the oleoresin (gum or pitch) of the pine tree. As originally used the term included all raw materials used in building and maintaining sailing vessels, as, for instance, tar, pitch, rosin, flax, cordage, masts and timber. The possibility of obtaining a source of supply for these materials independent of Russia and the Dutch traders had considerable influence upon the British in establishing the colonies in Virginia. Flax, cordage and lumber are no longer classed as naval stores. The term embraces turpentine, rosin, pine oil, pine tar, pine tar oil, pitch and rosin oil. Charcoal from the destructive distillation of "lightwood" and pine needle oil are sometimes included but are not generally considered to be true naval stores products. The former is made from the wood and not from the oleoresin of the tree and the latter is an essential oil usually classed under drugs and chemicals.

Approximately 50% of the world's production of naval stores comes from the United States, 15% from France, 10% each from Russia and Portugal, with smaller amounts from Spain, Greece, Mexico and a few other countries. The United States naval stores crop is all produced in the southern pine belt which includes North and South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana and a small part of Texas. U.S. naval stores for years were produced from the long leaf pine (*Pinus palustris* or *Pinus australis*). Now that the virgin forests have been cut, these products are obtained from second growth which is chiefly slash or Cuban pine (*Pinus caribaea*). The French source of naval stores is the maritime pine (*Pinus pinaster*) in the Landes.

There are four distinct methods of manufacture, and the products therefrom vary widely in their characteristics. The largest amount of naval stores is produced by the gum method. The trees are "chipped" and the oleoresin which exudes from the wood in order to heal the wound is caught in cups, collected each week and transported to a still. The historic method of processing the gum, and the method still largely used, is to put it in a copper still heated by direct fire. The volatile material is distilled off with steam (generated from the water in the gum) and condensed as gum turpentine. The residue is gum rosin and is run out of the bottom of the still, strained through cotton batting into troughs and dipped into barrels. An increasing percentage of the oleoresin crop has been transported to centrally located factories and distilled in modern equipment under technical control. The rosin is graded according to colour and freedom from dirt—the pale grades being *X, WW, WG, N, M;* the medium grades being *K, I, H, G* and *F;* the dark grades being *D* and *B.*

DD turpentine, *DD* pine oil, pine tar, pine tar oil and charcoal are produced by the destructive distillation of the dead wood and stumps left on the ground after the lumbering industry has taken off the timber. Long leaf pine wood contains only 5% resinous material, but the dead wood and stumps may contain as high as 40% and wood can be obtained in commercial quantities with more than 20% resinous material. Destructive distillation was originally carried out in the woods by covering a pile of dead wood with sod, clay, etc., and burning the pile with an insufficient amount of air to form complete combustion. The process is now carried out in well-designed retorts where all volatile materials can be recovered.

The third method of manufacture is the so-called steam-distillation, solvent-extraction process, wherein the dead wood and stumps from cutover land are ground up, loaded into steel retorts, steamed with live steam, extracted with solvents, and the pine products recovered. Some of the steam distillation plants represent large investments and have spent much money and effort on research programs. They have improved and diversified their products and made them the foundation of a pine tree chemical industry. The production of steam-distilled wood turpentine, and wood rosin is equal to 60% of America's output of gum turpentine and gum rosin. The fourth method manufactures sulphate wood turpentine, sulphate pine oil and liquid rosin as by-products from the manufacture of paper pulp from pine wood by the sulphate process. Turpentine is used chiefly in the paint and varnish industry, in chemicals and pharmaceuticals, and in shoe polish; rosin, in paper, soap, paint and varnish, foundry and linoleum; pine oil, in mining, textile manufacture, disinfectants and rubber.

NAVAL STRATEGY AND TACTICS. Naval strategy is the science of employing naval force to further the national aims. It involves the preparation and distribution of naval forces in order to meet the enemy in the most advantageous time, place

and numbers. Naval tactics is the science of employing naval forces when within striking range of the enemy. It involves the use of weapons and manoeuvres in battle. The dividing line between strategy and tactics at sea delineates itself faintly; tactics usually takes up where strategy leaves off and any significant change in one vitally affects the other. Down through the ages the principles of strategy have not changed since the object of every nation engaged in naval warfare has always been to gain control of the sea and deny it to the enemy. However, the evolution of weapons and the increase in mobility have constantly altered tactical precepts.

Naval Strategy.—Naval strategy is of two types (1) *grand strategy* and (2) *campaign strategy.* Grand naval strategy is a component part of national strategy and cannot be developed until national strategy has determined what the nation's objectives are, the degree of co-ordination and participation among army, navy and air force, and what proportion of the military and economic resources will be allocated to each. From this information grand naval strategy determines the size of the navy, types of vessels and aircraft, location of bases and distribution of strength.

Once objectives and means are established grand strategy utilizes the navy to further the international policy of the nation. A nation may use the size or the location of its navy as a threat so as to achieve national aims without war. Britain did just this with its navy in the 19th-century Pax Britannica and the United States in 1941 warned Japan by shifting the bulk of the U.S. fleet to Hawaiian waters. When such threats fail, and neither compromise nor submission accord with the national aims, war ensues and opponents pursue prewar objectives by means of force.

Campaign strategy narrows the objective to one particular phase or theatre of war, concerning itself less with national policies than with naval effort within the particular campaign. An important adjunct of campaign strategy is the dovetailing of naval effort with that of ground forces and land-based air forces. In most respects, campaign strategy is grand strategy on a restricted scale. In World War II Japanese grand strategy dictated that the fleet would assist the army in conquering the East Indies, while campaign strategy determined the distribution of forces and sequence of objectives in that area.

Naval strategy may be a *total offensive* wherein one power seeks not only to deny the seas to the enemy but to destroy every vestige of naval opposition. Accomplishment of this end may be by naval action alone as at Tsushima (1905) when the Japanese annihilated the Russians. Or, it may be by triphibious (land, sea and air) assault on the wellsprings of enemy naval power, as occurred in the last year of World War II, against Japan. On the other hand, a nation may fight a *limited offensive* if its sea power is weak or diverted elsewhere. In 1943 both Japanese and Americans chose just that sort of war, the Americans biding their time until shipyards had turned out the fleets necessary for the cross-ocean sweep, the Japanese husbanding strength and bulwarking the perimeter of the expanded empire. The "fleet in being" strategy is a modification of the limited offensive, exemplified in the stationing of the German fleet idly at Wilhelmshaven in World War I as a constant menace which anchored the much larger British navy to northern Scotland. In this case the British, too, were content with a type of limited offensive, the distant blockade, since no pressing demands for the battle fleet came from other theatres. A strong power may try another form of limited offensive, a close blockade—by ships as in the Civil War, by planes as in the South Atlantic anti-submarine barrier of World War II or by mines as in the offensive mining of Japanese homeland waters. Normally a nation weak in sea power has no alternative but to adopt the limited offensive. When two maritime opponents are evenly matched in naval power the struggle for control, usually a total offensive, results in major clashes as in the Anglo-Dutch wars of the 17th century. When one side outpowers the other, the stronger will at once gain mastery of the sea lanes wherever its navy sails. Then the weaker nation may adopt a limited offensive strategy of attrition against the stronger. The privateers of the American Revolution, the raiders of the Confederacy and the submarines of Germany were instruments of such strategy. To further counter an unfavourable balance of sea power a nation may intensify ground campaigns as did Napoleonic France. Adolf Hitler's Germany tried similar strategic redress with the air blitz. But no nation without control of the ocean lanes, including the air over them, can win an overseas campaign.

The factors which influence the form of strategy are always determined by an estimate of the situation which outlines the nation's own objectives together with the probable and possible objectives of the enemy based on logistic capabilities, intelligence information and psychology of opposing peoples. All these factors are synthesized into a final decision as to the strategic course of action.

Strategic planning on either the grand or campaign scale requires constant application of the science of logistics—procurement, supply and maintenance of all material which goes into a fleet. An examination of fleet cruising ranges in the past emphasizes the strategic importance of logistics. In Greek and Roman days small, fragile ships powered by oarsmen of limited endurance dictated a strategy of short-distance campaigning. When the British, Dutch, Spanish and French built their great sailing navies powered by wind and fed from capacious holds, strategy altered because distance had slight significance. In 1805 Nelson chased Admiral Pierre Villeneuve across the Atlantic and back without replenishing supplies. With the advent of steam the range of navies shrank again, and strategy prohibited campaigns in areas where coal could not be stocked. The trials of the Russian fleet bound from the Baltic to Port Arthur in 1905 carrying extra coal on deck dramatically illustrated the need of bases for the steam warships at the turn of the century. But World War II navies once again acquired self-sufficiency at sea by carrying their train of supplies to war with them. By means of tankers and supply ships great fleets kept the sea for weeks on end, as they had during the sailing-ship era.

Good naval strategy demands a concentration of force so that maximum effort can be employed whenever needed. Such concentration also insures against piecemeal destruction by the enemy. In the Russo-Japanese War the Russians divided their fleet between two oceans and the concentrated Japanese fleet defeated each segment separately. In World War II global conflict compelled an unwanted dispersal of forces on the Allies which kept them on the defensive until each ocean was supplied with the concentrated sea power capable of coping with anything the enemy might employ. Gathering such a concentration was particularly difficult in the Pacific where the Japanese with interior lines of communication could threaten a quick concentration on any part of their perimeter.

Another requisite of successful naval strategy is flexibility. Provision must be made to alleviate sudden setbacks or exploit unforeseen advantages. Defeat at Pearl Harbor compelled instantaneous revision of U.S. strategy in the Pacific. On the other hand, in the autumn of 1944 unexpected erosion of Japan's naval air power invited the Allies to advance the schedule of Pacific offensives. With the tap of a radio key this strategic change occurred smoothly even though it altered logistic requirements, troop routing and fleet dispositions. On the opposing side, one of the major failings of the Japanese was inflexibility of strategic planning, particularly in the Solomons where they dribbled men, planes and ships into destruction. Having refused to strike one huge blow, which might have won, they failed to withdraw soon enough to prevent staggering losses.

Naval Tactics.—When strategic considerations have brought opposing naval forces within striking range of each other, naval warfare enters the realm of tactics and decision is made as to when, where and how to deal the actual blow. As in land warfare, it is always desirable to concentrate superior force at the point of contact.

The two elements of tactics are weapons and manoeuvre. Historically these two elements have varied in relative importance which has accounted for the fact that tactical principles are variable whereas strategic concepts are not. In the Peloponnesian Wars the emphasis was on the weapon, which in this case was the foot soldier who merely transferred his sword to a floating platform, there to fight as he would on land. Manoeuvre was rarely used as an advantage. This type of tactical thinking led the Corinthians at the battle of the Corinthian gulf (Naupactus) (429 B.C.) to form their ships in a circle like a sort of seagoing phalanx as the Athenians approached. The Corinthians

had not allowed room for manoeuvre so that wind and tide tangled ships hopelessly and they were destroyed in detail by the enemy.

Straight through to the middle ages the weapon remained the predominant factor in naval tactics, and that weapon was the seagoing soldier. The Romans adopted a boarding platform, the *corvus,* so as to bring legionnaires into arm's reach of the enemy. Fighting was still hand-to-hand at the battle of Lepanto in 1571. The only manoeuvre of consequence was ramming or shearing off the opponent's oars, and that was not an end but merely a means to stop the enemy long enough to board.

Meanwhile in the Atlantic, the galley gave way to the sailing ship equipped with the "Great Gun" of Henry VIII's time. Now it was possible to destroy ships as well as individuals. In the Anglo-Dutch wars which followed, manoeuvre was more important than weapon. It required superior seamanship to gain and hold the weather gauge (upwind station from the foe) from which one could select the quarter for attack, the range of the fighting and the time to commence or break off action. As for weapons—assuming forces were equally matched—the ship which manoeuvred to bring the most guns to bear won the battle. There was little weapon skill.

However, by 1750 all navies attached too much importance to manoeuvre. Fleets, following the tactical doctrines of the Comte de Tourville, pranced around one another seeking to gain the weather gauge but once achieving it fought in ship-for-ship duels rather than concentrating many ships against few. Not until Lord Nelson came along was the balance between manoeuvre and weapon again restored. Nelson's manoeuvring brought his column head-on against the enemy column at Trafalgar (1805), piercing it so that many of his ships concentrated on a few of the enemy. This manoeuvre, similar in effect to that called *capping* or crossing the "T" embodied the fundamental principle of naval tactics—manoeuvring to bring superior weapon power to bear.

The advent of steam propulsion once again made the weapon more important than the manoeuvre. In the U.S. Civil War the idea was to smash the other fellow with as few preliminaries as possible. Ironclads slugged viciously, and victory went to the craft that could punish the hardest and still survive the most damage at close range. Tactics paid little heed to manoeuvres.

With the beginning of the 20th century, the development of different types of steam warship focused attention once more on manoeuvre. Involved rules for fighting battles were drawn up for all navies. Employment for these rules resulted infrequently in World War I, no doctrines were disproved and little change of tactical concept occurred before World War II. Such vessels as the aircraft carrier and the submarine (its use restricted by international law) were considered subsidiary elements of the fleet to assist the big guns of battleships.

With the outbreak of World War II it became apparent that aircraft successes would require drastic revision of naval weapons and manoeuvres. In Nov. 1940 British carrier aircraft swooped down on Taranto and crippled half the Italian fleet in one blow. Pearl Harbor in December of 1941 demonstrated conclusively that the striking range of fleet weapons had increased from 20 mi. to 200 mi.

Thus the history of naval tactics in World War II is partly the story of the integration of aircraft into the fleet. In the Atlantic, aircraft co-operated with surface vessels in destroying submarines. In the Pacific the carrier aeroplane became a primary weapon, shielding the fleet against attack, dealing heavy blows at enemy air and sea power and spearheading amphibious invasions. At war's end the carrier was the nucleus of the "task force," an organization of carriers, battleships, cruisers, destroyers and other types of combatant craft.

Another tactical innovation in World War II occurred in amphibious warfare. The concept of landing troops on a defended hostile shore had been considered by Napoleon and Hitler and tried unsuccessfully by the British at the Dardanelles (1915-16). It was Allied development of amphibious techniques that made possible the cross-channel landing in Normandy and the 1,000-mi. leaps of whole armies across the Pacific. Sea power with the aid of naval guns and carrier planes extended itself onto a strip of beach until land power and land-based air power had established firm footing. Subsequent to the landings these same naval guns and planes supported troop advances and kept the enemy from breaking ocean supply lines. At Okinawa the fleet came and stayed for weeks.

Throughout the evolution of naval tactics there has existed a constant interaction, a seesaw between offensive and defensive whether it be in weapons or manoeuvre. In the weapons' field passive defense has been armour against bombs and guns, compartmentation of ship hulls against torpedoes and mines, nets and mine fields against submarines. Sometimes weapons are counterbalances. A half century ago the torpedo boat stimulated the building of the torpedo-boat destroyer and the submarine promoted the subchaser. More recently, radar-controlled anti-aircraft fire with proximity-fused shells reduced the aeroplane menace. There were also instances where countermanoeuvres by the defense neutralized offensive tactics. At Jutland (1916) the attempt of the British to cap the German "T" failed because Admiral Reinhard Scheer introduced a new manoeuvre, simultaneous countermarch by ships within a column. In both World Wars I and II U-boat campaigns drove ships to concentrate in convoys rather than steam separately. In World War II it was quickly discovered that column formations were unsatisfactory against air attack, so ships adopted the tight circular formation more easily manoeuvred and defended.

A desirable feature in any naval operation is tactical surprise which may derive from either a weapon or a manoeuvre. "Greek fire," an incendiary weapon, when first used by the ancients came as a surprise to the foe. In the Civil War the ironclad "Merrimac" was another surprise weapon, defeating conventional warships until the "Monitor" appeared and in turn surprised the "Merrimac." The Japanese Kamikaze (suicide plane) came as a dangerous surprise to the Americans in late 1944. The submarine's great tactical advantage is always surprise.

Surprise manoeuvres have often proved invaluable. In 1652 the British admiral Robert Blake surprised his Dutch foe by navigating through an apparently impassable shoal strait to gain the weather gauge and attack suddenly. Admiral Scheer's surprise countermarch at Jutland saved the Germans from destruction. The Japanese assault on Pearl Harbor in 1941, prior to a declaration of war, is the classic example of complete tactical surprise.

The ramifications of modern fleet tactics are bewildering indeed and rely heavily on modern science. In an amphibious operation, carrier task forces lead the advance to the objective. Reconnaissance planes and submarines give advance intelligence on the state of enemy defenses, hydrography and geography. Meteorologists furnish vital data on weather. Enemy submarine attacks are countered and friendly submarines are judiciously employed to cut the enemy's supply lines. When within flying range of the target, carriers launch *strikes* of aircraft to shoot down opposing planes and hit ships and ground installations. Bombardment groups of battleships, cruisers and destroyers soften the enemy and engage ships that may have escaped the carriers. Under cover of the bombardment, minesweepers and demolition squads clear out mines and underwater obstacles. The amphibious force carries the assault troops to the beach, some in boats and amphibian vehicles launched from mother ships, others in large ocean-going craft with bow doors and ramps. Troops pour out against the enemy under the protective fire of gunboats, rocket ships, planes and big naval guns. Following the assault landings transport echelons steam up with additional troops and supplies.

Should the enemy react with his fleet a carrier-against-carrier battle may result followed by action between surface ships. At Midway (June 1942) the destruction of all Japanese carriers by the U.S. carrier planes made it impossible for the Japanese to continue either with a surface engagement or amphibious invasion. At the battle of Leyte gulf (Oct. 1944) near-by friendly air bases encouraged the Japanese to send their fleet forward for a surface engagement.

In carrier battles the tactical objectives are opposing carriers. When the enemy has been located by scout aircraft, a strike is launched which must penetrate the enemy defensive fighters (combat air patrol) and anti-aircraft screen before attacking. Every effort is made to coordinate the attack so that bombers, torpedo planes and strafing fighters converge simultaneously on the enemy from several directions. In these battles relative wind direction is just as vital as it was in John Paul Jones's day. A carrier must head into the wind to launch planes and unless that wind is blowing from the direction of the enemy, the carrier will open range during flight operations. Such adverse winds plagued the Americans notably at the battles of Midway and the Philippine sea.

Battles between carriers are spectacular and decisive when they occur. But in the latter days of World War II the carrier's tremendous contribution was the almost routine support of amphibious operations and the day-in-and-day-out war on enemy submarines.

In surface actions, the primary tactical objectives are the enemy heavy ships. Such actions usually open with destroyer torpedo attacks followed by heavy gun duels in which all ships participate. The crossing of the "T" is as vital today as it was in Nelson's time and won U.S. victories at the battle of Cape Esperance (Oct. 1942) and the battle of Surigao strait (Oct. 1944). Before the invention of radar, night surface actions were likely to degenerate into melees or be decided by chance. Today they can be fought with the same precision as daylight engagements.

Tactics, unlike strategy, rarely permits long-range planning and exact execution. Each situation must be estimated as it occurs and a spot decision rendered. But the decision is still a considered one based on knowledge of intentions and capabilities of both sides. It is particularly important that a tactical decision not jeopardize campaign strategy. Admiral Raymond A. Spruance at the battle of the Philippine sea (June 1944) was faced with the choice of chasing an enemy fleet which he might destroy, or remaining near Saipan to protect the amphibious landings. He correctly chose to remain near Saipan and insure that nothing interfered with his campaign strategy which required conquest of that island.

In general a tactical commander's course of action will be one of the following: concentration, dispersion, deception, interception or a combination of these. Concentration multiplies strength at a given point. The anti-submarine convoy and the submarine wolf pack are examples. Dispersion is a defensive tactic adopted only when it is advisable to risk losing some of a force in order that the rest may attain the objective. North Atlantic convoys dispersed whenever the escorts were outgunned by German surface raiders. Deception comes in many guises—decoy forces, smoke screens, camouflage and false

signals. Interception may be defensive or offensive. An anti-submarine screen of ships, a harbour mine field and a fighter-plane air patrol over a force are all defensive means of intercepting the foe. Air attack on enemy bases and ships, bombardment of his shores and advancing to meet his fleet with guns and torpedoes are offensive interceptions.

There is no factor too small for consideration in tactics—weather, formations, speeds, hydrography, fatigue, psychology and countless others to such a number that Admiral Ernest J. King remarked, "Naval tactics is very much more of an art than it is a science, but unless there is comprehension of the science involved, success in the art is not to be expected."

The use of atomic weapons, guided missiles, high-speed submarines and jet aircraft posed new problems in naval tactics. To cite an instance, dispersion is clearly one defense against atomic bomb attack. But concentration has always been the defense against submarines. These contradictory requirements must be resolved either by weapon or manoeuvre so that protection is afforded against both submarine and bomb.

NAVAN (An Uaimh), a market town of co. Meath, Ireland, situated at the confluence of the Blackwater with the Boyne. Pop. (1946) 4,102. Here the Clonsilla and Kingscourt branch of the Great Southern railway crosses the Drogheda and Oldcastle branch of the Great Northern. By the former it is 30 mi. N.W. of Dublin. Navan has considerable trade in corn and flour, some manufacture of woollens and of agricultural implements, and a tannery. It was a barony of the palatinate of Meath, was walled and fortified, and was incorporated by charter of Edward IV. It suffered in the civil wars of 1641. It was a favourite centre for rod-fishing.

NAVARINO, BATTLE OF, fought on Oct. 20, 1827. By the treaty signed in London on July 6, 1827 (*see* GREECE: *History*), England, France and Russia agreed to demand an armistice, as preliminary to a settlement. Sir Edward Codrington, then British commander-in-chief in the Mediterranean, received the treaty on the night of Aug. 10 at Smyrna, together with instructions to demand an armistice, and to intercept all supplies coming to the Turkish forces in the Morea. He at once proceeded to Nauplia to communicate with the Greeks, accompanied by his French colleague, Rear-admiral de Rigny. The Greek Government agreed to accept the armistice. Admiral de Rigny left for a cruise in the Levant, and Sir Edward Codrington, hearing that an Egyptian armament was on its way from Alexandria, found it, together with a Turkish squadron, at anchor at Navarino on Sept. 12. The Turkish Government refused to accept the armistice, but on the 25th an interview took place between Codrington, de Rigny, who had just arrived, and Ibrahim Pasha on behalf of the sultan, at which Ibrahim gave a verbal engagement not to act against the Greeks pending further orders. The allies, who were in want of stores, now separated again, Codrington going to Zante and de Rigny to Cervi, frigates being left to watch Navarino. The British admiral had barely anchored at Zante before he was informed that the sultan's forces were putting to sea. From Oct. 3 to 5 Codrington, who had with him only his flagship the "Asia" (84) and some smaller vessels, was engaged in turning back the Egyptian and Turkish vessels, a task in which he was aided by a violent gale. He resumed his watch off Navarino, and on the 13th was joined by de Rigny and the Russian squadron under Rear-admiral Heiden. By agreement among the Powers the command was entrusted to Codrington. The allied force consisted of three British, four French and four Russian sail of the line, and a total of 15 frigates, brigs and schooners. The Egyptians and Turks had three ships of the line and 15 large frigates, together with a swarm of small craft making a total of over 80. Ibrahim Pasha, though unable to operate at sea, considered himself at liberty to carry on the war by land, and his men were employed in burning the Greek villages. On Oct. 17 a joint letter of expostulation was sent to Ibrahim, but was returned with the manifestly false answer that he had left Navarino. The admirals, therefore, decided to stand into the bay. A French officer in the Egyptian service, named Letellier, had anchored the vessels of Ibrahim and the Turkish admiral in a horseshoe formation, of which the points touched the entrance to the bay, and there were forts on the lands at both sides of the entry. The allies entered in two lines and began to anchor in the midst of Ibrahim's fleet. Captain Fellowes, commanding the British frigate "Dartmouth," seeing a Turkish fireship close to windward of him, sent a boat to demand that she should be removed. The Turks opened fire on the boat, and the action at once became general. The result was obtained by heavier broadsides and better gunnery. Three-fourths of the Turkish and Egyptian vessels were sunk or fired by their own crews. The allied casualties were 177 killed and 519 wounded. The loss of the Turks and Egyptians was never accurately reported.

NAVARRE, a province of northern Spain, and formerly a kingdom which included part of France. The province is bounded on the north by France (Basses Pyrénées) and Guipúzcoa, east by Huesca and Saragossa, south by Saragossa and Logroño and west by Álava. It is traversed from east to west by the Pyrenees and the Cantabrian Mountains. Area 4,056 sq.mi. Pop. (1940) 369,618. From Navarre there are only three practicable roads for carriages into France—by the Puerta de Vera, the Puerta de Maya and Roncesvalles. The highest summit is the Monte Adi (4,931 ft.). The chief river flowing towards the Atlantic is the Bidassoa, which rises near the Puerta de Maya. After flowing southwards through the valley of Baztán it takes a north-easterly course, and for a short distance above its outfall at Fuenterrabia constitutes the frontier between France and Spain (Guipúzcoa); by far the larger portion of Navarre is drained to the Mediterranean through the Ebro, which flows along the western frontier and crosses the extreme south of the province. The hilly districts consist almost entirely of forest and pasture, the most common trees being the pine, beech, oak and chestnut. Much of the lower ground yields grain; the principal fruit is the apple, from which cider is made in some districts; hemp, flax and oil are also produced, and mulberries are cultivated for silkworms. Navarre is one of the richest provinces of Spain in live stock. Game is plentiful.

The Ebro Valley railway traverses southern Navarre and skirts the western frontier. It has several branch lines. Besides Pamplona (*q.v.*), the capital, the only towns with more than 5,000

inhabitants are Baztán (10,326), Corella (5,663), Estella (6,992) Tafalla (6,036) and Tudela (12,873).

HISTORY

The kingdom of Navarre was formed out of a part of the territory occupied by the Vascones (*i.e.,* the Basques and Gascons), who occupied the southern slope of the western Pyrenees and part of the shore of the Bay of Biscay. In the course of the 6th century there was a considerable emigration of Basques to the north of the Pyrenees. The cause is supposed to have been the pressure put upon them by the attacks of the Visigoth kings in Spain. The name of Navarre is derived by etymologists from "nava," a flat valley surrounded by hills, and "erri," a region or country. It began to appear as the name of part of Vasconia toward the end of the Visigoth epoch in Spain in the 7th century. Its early history is more than obscure. The first historic king of Navarre was Sancho Garcia, who ruled at Pamplona in the early years of the 10th century. Under him and his immediate successors Navarre reached the height of its power and its extension (*see* SPAIN: *History,* for the reign of Sancho el Mayor, and the establishment of the Navarrese line as kings of Castile and Leon, and of Aragon). When the kingdom was at its height it included all the modern province of the name; the northern slope of the western Pyrenees called by the Spaniards the "Ultrapuertos" or country beyond the passes, and now known as French Navarre; the Basque provinces; the Bureba, the valley between the Basque mountains and the Montes de Oca to the north of Burgos; the Rioja and Tarazona in the upper valley of the Ebro. In the 12th century the kings of Castile gradually annexed the Rioja and Álava. While Navarre was reunited to Aragon, 1076–1134 (*see* SPAIN: *History*), it was saved from aggression on the east, but did not recover the territory taken by Castile. About the year 1200 Alfonso VIII of Castile annexed the other two Basque provinces, Biscay (Vizcaya) and Guipúzcoa. Tarazona remained in possession of Aragon. After 1234 Navarre, though the crown was claimed by the kings of Aragon, passed by marriage to a succession of French rulers. In 1516 Spanish Navarre was finally annexed by Ferdinand the Catholic. French Navarre survived as an independent kingdom till it was united to France by Henry IV. From 1510 until 1833, when it was incorporated with Spain, Navarre was a viceroyalty. Battles between insurgents and loyalists took place in Navarre during the civil war of 1936–39.

NAVARRETE, JUAN FERNÁNDEZ DE (*c.* 1526–1579), Spanish painter, called EL MUDO (because he was dumb), was born in Logroño. He is said by José de Sigüenza (*Historia de la Orden de San Jerónimo,* 1605) to have studied in Italy under Titian and others and to have been summoned back to Spain by Philip II. In 1568 he was appointed painter to the king, who chose him to play a major role in the decoration of the Escorial, near Madrid, though he did not live to fulfil it; of the 32 altarpieces commissioned for the church (1576) only 8 were completed at the time of his death in Toledo on March 28, 1579.

El Mudo's eclectic style was based on that of the Italian mannerists working in the Escorial; and he was strongly influenced by Titian, though there is no evidence that he was his pupil. In the "Burial of S. Lawrence" (Escorial), unfinished at his death, naturalism and chiaroscuro foreshadow later developments of the Spanish school.

See J. Zarco Cuevas, *Pintores españoles en San Lorenzo el Real de El Escorial,* (Madrid, 1931). (E. Hs.)

NAVARRO, PEDRO (*c.* 1460–1528), Spanish military engineer and general. Beginning as a sailor, he became *mozo de espuela,* or running footman, to the cardinal Juan de Aragon. Later he enlisted as a mercenary in a war between Florence and Genoa and took part in the warfare between the Genoese corsairs and the Mohammedans of northern Africa. He enlisted under Gonzalo de Córdoba when he sailed to Sicily to take part with the French in the partition of Naples, and in 1500 he laid mines to breach the walls at Cephalonia without much success. He distinguished himself in the campaigns of 1502–03, by the defense of Canosa and of Taranto and by his share in the victory at Cerignola. His mining operation against the castles of Naples, held by French garrisons, in 1503, won him fame as the first military engineer of his age. At the expulsion of the French from Naples, he received from his king a grant of land and the title of count of Olivetto. In 1508 he took Velez de Gomera, largely by means of a species of floating battery which he invented. He did excellent service in the conquest of Oran (1509) and took Bougie and Tripoli in 1510. At Ravenna he covered the orderly retreat of the Spanish foot, was taken prisoner by the French and imprisoned in the castle of Loches. Ferdinand, "the Aragonese skinflint," refused to pay his ransom, and after three years of imprisonment, Navarro entered the service of Francis I in a pique. He distinguished himself in the passage of the Alps, at Marignano, at Milan and in the siege of Brescia. He was at the battle of Pavia and in 1522 was taken prisoner at Genoa by the Spaniards. He was confined at Naples till the peace of 1526 and his Olivetto estate was confiscated. His last service was in the disastrous expedition of Odet de Foix Lautrec to Naples (1527).

NAVE, ecclesiastically considered, that part of a church appropriated to the laity as distinguished from the chancel, the choir or the presbytery, reserved for the clergy. In a 14th-century letter (quoted in Gasquet's *Parish Life in Medieval England,* p. 45, 1906) from a bishop of Coventry and Lichfield to one of his clergy, the reason for this appropriation is given. "Not only the decrees of the holy fathers but the approved existing customs of the Church order that the place in which the clerks sing and serve God according to their offices be divided by screens from that in which the laity devoutly pray. In this way the nave of the church . . . is alone to be open to lay people, in order that, in the time of divine service, clerics be not mixed up with lay people, and more especially with women, nor have communication with them, for in this way devotion may be easily diminished." The word "nave" has been generally derived from Lat. *navis,* "ship." Salmasius in his commentary on Solinus (1629) finds the origin in the resemblance of the vaulted roof to the keel of a ship. The use of the word *navis* may, however, be due to the early adoption of the "ship" as a symbol of the church (*see* Walter Skeat's note on *Piers Plowman,* xl, 32). The Greek ναός, Attic νεώς (ναίειν, "to dwell"), the inner shrine of a Greek temple, the *cella,* has been suggested as the origin of the word. This derivative must presume a latinized corruption into *navis,* for the early application of the word for ship to this part of a church building is undoubted.

Architecturally considered, the nave is the central and principal part of a church, extending from the main front to the transepts, or to the choir or chancel in the absence of transepts. When the nave is flanked by aisles, light is admitted to the church through clerestory windows. (*See* BYZANTINE AND ROMANESQUE ARCHITECTURE.) At times, a gallery was carried above the side aisles.

NAVEL, in anatomy, the umbilicus, the depression in the abdomen which indicates the point through which the mammalian foetus obtained nourishment from its mother through the blood vessels of the umbilical cord. (*See* ANATOMY: *Superficial and Artistic.*)

NAVIGATION. The science or art of conducting a ship or aircraft from one place to another. Although much of the equipment used and the principles of air and surface navigation are the same, the aspect of the subject dealt with in this article is restricted primarily to shipboard navigation.

Historical.—Before the introduction of the mariners' compass in the 12th or 13th century the only practical means among western nations of navigating ships was to keep within sight of land or to steer for short distances out of sight of land by reference to the sun or stars, more particularly the pole star. In eastern waters, long voyages out of sight of land were possible because of the steadiness in direction of the monsoons, which enabled vessels to keep their course by running directly before the wind.

The act of fixing positions by astronomical methods progressed far more rapidly on shore than at sea. The few rude appliances available to the navigator were limited until the 18th century to finding only the latitude of the ship at sea. No means of finding the longitude was devised, except the very rough method of estimating the run of the ship—known as dead reckoning—until the introduction, for practical purposes, of the lunar problem early in the 18th century. This complicated calculation made the finding of longitude one of considerable difficulty, even after the introduction of the sextant; for the moon passes the stars lying in its course through the heavens at a mean rate of only 33″ in one minute of time. Since its motion in regard to the sun is less than this, it is obvious that a very small error in measuring the distance produces a correspondingly large error in the resulting longitude. The rise of what may be termed modern methods of astronomical navigation may be fairly dated from the invention of the chronometer in 1735, although it was not until about 40 years later that extensive trials of John Harrison's chronometer proved to navigators the value of this instrument. The method of finding the apparent, or sun, time at the ship's position was well-known; but until the chronometer came into use afloat, and enabled the navigator to carry Greenwich mean time with him on board, it was not possible to find the longitude by simple calculation. (*See* CHRONOMETER.)

Rapid strides were made in the 19th century in the improvement of instruments and the publication of textbooks useful to the navigator and also in the production of tables of logarithms compiled to facilitate the solution of trigonometrical problems associated with navigation. The *Nautical Almanac,* first published under authority for the use of seamen in 1767, came into general use. Machines for taking soundings were introduced, and various methods were invented whereby the errors of the magnetic compass, due to the permanent and induced magnetism in the metal of the ship, could be very largely eliminated. Methods were applied whereby that important factor in obtaining an accurate position, the speed of the ship through the water, could be serviceably ascertained. The introduction of steam vessels went far to simplify the problems of navigation as the dead reckoning could be calculated with greater accuracy than was the case with sailing vessels. The progress of the art of navigation was and is, of course, still inseparably connected with chart drawing. The steady and continuous improvement in the number and accuracy of charts resulted from the marine hydrographic and coast survey services conducted by the principal maritime nations. World War II requirements, moreover, accelerated the advancement of several invaluable electronic aids to navigation.

Modern Navigation.—With the above brief summary of the progress of navigation, the modern methods in use will be described, referring the reader for a more detailed and technical description to the textbooks available on the subject. When making a passage from port to port situated at no great distance apart, the navigator ordinarily selects a course on a Rhumb line, which, on a Mercator's chart, the chart normally used, is a straight line. Between ports situated at great distances from one another, and differing widely in longitude, the course followed should be on the great circle, which, on a Mercator's chart is a curve, the shortest distance between any two places on the surface of the earth.

Time at Sea.—To avoid confusion a system of time zones for timekeeping at sea is in force in the navies of most countries. This system has been adopted so that vessels at sea, within certain defined limits of longitude, shall keep the same time as that used on land. The world is longitudinally divided into 24 zones of 15° each, the centre of the system being the meridian of Greenwich. This centre division lies between the meridians of the $7\frac{1}{2}$° E. and $7\frac{1}{2}$° W. and is known as the zero zone, or zone O; the zones lying to the eastward being numbered in sequence with a minus (−) prefix; those to the westward being similarly numbered with a plus (+) prefix. The limits of the zones on land are modified somewhat according to the geographical configuration of the country concerned. By this system the same time is kept whether on land or sea throughout each zone except during the periods of daylight-saving time. The term Greenwich mean time (G.M.T.) is considered to be the standard time of the meridian of Greenwich, commencing at midnight and reckoned throughout the 24 hours.

Since all nautical and air almanacs give the position of the heavenly bodies in Greenwich mean time (G.M.T.), this is the time reckoning which is of the utmost significance to the navigator. In the United States navy, Greenwich mean time was previously called Greenwich civil time (G.C.T.), but in 1953, to avoid misunderstanding and for the sake of uniformity the designation G.M.T. was adopted.

Celestial Navigation.—When considering the various methods of fixing the position of a ship at sea by observations of heavenly bodies, it is assumed that the errors of the chronometers are accurately known. Although chronometers reached a high standard of efficiency they are nevertheless subject to very slight variations in respect to the true Greenwich time. The transmission of radio time signals enables navigators to obtain accurate time checks regularly throughout the world. In 1953 there were 71 stations operating on various radio frequencies and situated in different countries transmitting these signals. It is desirable to refer to the relevant publications for details of the form of transmission and procedure.

Assuming then that the true Greenwich time is known, that the observer is competent and the instrumental errors are known, the accuracy of a sea position, obtained by the observation of heavenly bodies, depends mainly on the accuracy of the sea horizon. On account of abnormal refraction occasioned by special conditions in the atmosphere, the sea horizon, as seen by an observer, is often displaced from the position which the tables of normal dip of the horizon would assign to it. This refraction is most common in localities where the temperature of the air and water differ widely. By combining the results obtained from observation of bodies situated in opposite quarters of the horizon, the errors in finding the true position of the horizon are largely counteracted. The conditions at dawn and twilight, when the horizon is visible and suitably placed stars can be selected, lend themselves to this purpose. And, moreover, it is in these periods that opportunities are present for another important purpose, that is, the selection, for simultaneous observation, of bodies whose relative bearings are such that the lines of position determined from the observations shall afford a well-defined intersection and thus serve to accurately find the latitude and longitude at approximately the same instant.

The only information that is obtained from one observation of a heavenly body is that the ship is somewhere on the circumference of a small circle, on the earth's surface, the centre of which is the geographical position of the body and the radius of which has the same arc measure as the zenith distance at the instant of observation. At this instant the heavenly body observed must be vertically over some one point on the surface of the earth. The latitude of this point is equal to the declination of the body, and the longitude is equal to the hour angle of the body from the meridian of Greenwich.

Because of the size of the globe which would be required, it is, of course, not practicable to plot this small circle on a globe and plotting it on a chart is inconvenient unless the radius is very short and the ship in low latitude. A small circle becomes very greatly distorted when plotted on a Mercator's chart, unless near the equator. The usual method of plotting, on a chart, is to represent a portion of the small circle as a straight line, a tangent to the circumference; that is, a straight line drawn at right angles to the bearing of the body observed. But, as a straight line represents accurately only a very small portion of the circumference of a circle, it is necessary to select some point through which to draw this line, as near the actual position of the ship as possible. This straight line is the "line of position" somewhere on which the ship must be. If another heavenly body, suitably placed, is now observed or, after a reasonable interval, to allow of a change of bearing, a second observation of the same body is made, a second line of position is obtained. The intersection of these two lines of position gives the actual position, provided the first line of position has been moved parallel to itself to allow for any run of the

ship in the interval. The line of position, being a tangent to the small circle, is at right angles to the radius or bearing of the body observed; it follows, therefore, that the angles at which the several lines of position will intersect one another must be the same as the angles at which the bearings intersect. Bodies should, therefore, be selected which will give a good "cut." Each line of position has precisely the same value, provided the altitude has been observed with equal accuracy. An error of 1′ in the observed altitude, and thence in the zenith distance, produces an error of one mile in the line of position.

Now as to the manner of obtaining the point through which to draw the line of position: Whatever method is used, provided the method is a correct one, the point found will be somewhere on the line of position. There can be only one line of position derived from the observation of one body. Different methods of calculation do not give different lines of position, but give different points through which *the* line of position can be drawn. A point can be found by assuming the latitude and calculating the resulting longitude, which is a procedure applicable to observations of heavenly bodies which have a large azimuth; or by assuming the longitude and calculating the resulting latitude, which is applicable to observations of bodies with a small azimuth. The best method, however, is to assume both latitude and longitude and, therefrom, to calculate the zenith distance of the body observed, or in other words, the radius of the circle of position. Having, at the same instant, observed the actual altitude, and thence the zenith distance, it is at once ascertained whether the ship is on a line which is directly nearer to or directly farther from, the geographical position of the body than the assumed or dead reckoning position.

ELECTRONIC AIDS TO NAVIGATION

Radio Direction Finders.—Determining the position of a ship at sea by means of radio bearings is of inestimable value to the navigator in thick weather when approaching the land. The bearing of a shore radio station from a vessel can be found either by means of a directional receiver in the ship, or by the system whereby the bearing of the ship's radio transmission is determined by one or more directional receiving stations on shore, the result being communicated to the ship.

The method of receiving bearings from ashore has the advantage that no additional equipment beyond the regular ship's radio is required. However, it is subject to the disadvantage that the navigator himself cannot take and check the bearings. On the other hand, when using a radio direction finder aboard ship the navigator can repeatedly check and plot his bearings upon the shore direction finding (D/F) station.

The radio direction finder employs a loop antenna which embodies characteristic directional properties. When the antenna, which can be rotated through a complete circle, is directed toward the source of the signal, *i.e.*, the transmitting station, a maximum strength signal is heard at the shipboard receiver; when the antenna is perpendicular to the transmitter a minimum signal is received. Since a definite minimum signal, or "null," is more readily determined, it is preferred for bearing purposes over the maximum signal. The position of the antenna, and consequently the relative bearing from the ship to the shore transmitter, may be read directly from the indicator which is a part of the D/F equipment. Any radio transmission, commercial or otherwise, can be used to obtain a bearing, provided that the exact location of the transmitting antenna is known. Bearings taken on two or more radio stations give a "fix" on the position of the ship.

The accuracy of radio bearings, like all other phases of navigation, are dependent upon properly functioning equipment and skilful operation. In addition radio bearings are subject to certain inherent errors which must be considered and corrected. Clear-cut minimum signals are difficult to distinguish at night; land separating the radio station and the ship may affect the accuracy of the bearing; radio waves travel a great circle, and when plotted on a Mercator's chart a correction may have to be made.

Some stations send out a sound signal at the same time that the radio signal is transmitted. By determining the time difference between receipt of the sound and radio signals, which travel at different rates of speed, the distance from the ship to the transmitter can be computed.

Radar.—This outstanding World War II electronic development is of immeasurable value to the navigator, for it allows him to "see" his surroundings on a cathode ray tube presentation when night, weather, smoke and other adverse circumstances would otherwise make accurate determination of position impossible. It is especially advantageous when a vessel is entering or leaving port, close inshore or travelling in company with other ships. The ship's position relative to possible navigational hazards can be determined rapidly by reception of an echo from a single object because radar gives both bearing and range. (*See* also RADAR.)

Loran.—This is an electronic system for long range navigation which, like radar, was a World War II development (the designation loran is composed of the first letters of *lo*ng *ra*nge *n*avigation; a similar system is called gee). Unlike radar, loran requires no transmission from the ship, but a special purpose radio receiving equipment operating on a relatively low frequency which gives it the capability of receiving signals at great distances. Loran transmitting stations on shore operate in pairs, one designated the master and the other the slave station, and are usually separated by from 200 to 400 mi. A pair of stations transmit pulsed and accurately synchronized radio signals which are received in the loran-equipped ship. The stations from which the signals are received can be identified by their radio frequency and the pulse recurrence rate. The time difference between arrival of signals from the master and slave stations is measured in microseconds at the loran receiving equipment. Once the time difference of signal reception is known, and the station pair identified, a line of position, along which the ship is located, can be found by reference to a loran chart. For every pair of loran stations, lines of constant time, *i.e.*, points on the earth's surface where the time difference for reception of signals from each pair will be constant, have been calculated and laid down on loran charts. If loran charts are not available, a line of position can be plotted on an ordinary navigation chart by using loran tables prepared for that purpose. A loran "fix" is obtained by repeating the process with a different pair of stations and determining where the lines intersect.

Loran has the advantage of accuracy, rapidity and long range (generally 700 mi. by day and 1,400 mi. at night). Stations throughout the world afford extensive loran coverage over the main travel routes. Like the radio direction finder and radar, loran is widely used in air as well as surface navigation.

Sonar.—This term is derived from the initial letters of the words *so*und, *na*vigation and *r*anging and is used to identify a type of equipment designed for underwater detection. Sonar basically consists of transmitting spurts, or "pings," of a high-frequency sound-wave beam through the water, and receiving return echoes from any submerged object struck by the outgoing waves. Sound is known to travel through water at approximately 4,800 ft. per second; therefore, the range or distance to the underwater object struck can be obtained by determining the time interval between the transmission of the sound "ping" and receipt of the echo at the sonar equipment aboard ship. Since the sound projection head can be trained in azimuth, the bearing from which the echo returns is also known. When the projection head is directed straight down, the sonar acts like a fathometer (*q.v.*) and gives the distance to the bottom.

Sonar was born of the necessity for a truly effective World War II antisubmarine device and is a refinement and improvement of World War I echo-ranging equipment. The peacetime value of sonar to safe navigation in unknown or poorly charted waters, in the presence of derelicts, icebergs and other submerged obstacles and in making it possible to know how much water under a ship is clear

Research continues in electronic aids to navigation, and the future possibilities seem almost boundless. However, the navigator must be ever aware that they are not infallible and are subject to material failure and human error; they are "aids" and supplements to but not replacements for the sound principles and practices of celestial navigation. (*See* also AERIAL NAVIGATION.)

SCIENTIFIC NAVIGATION AIDS

1. Officers on the bridge of the S.S. "De Grasse," determining the ship's position by means of sextants, through which the sun is sighted. 2. Bridge room of the S.S. "Queen Mary," showing two rudder wheels and magnetic compass between. The gyro-compass, housed below decks, has electrical contact with the gyro-pilot and the steering apparatus in the wheel house. 3. Radio room of the "Queen Mary," with eight operating positions, radio-telephone exchange, and chief accepting office for radiotelegrams of passengers. Control of the entire radio equipment, including transmission on 32 different wave-lengths, is concentrated here. 4. Navigating room of the S.S. "Ile de France." The loud-speakers, on vertical position, are used in establishing rapid communication between the bridge and other portions of the ship, serving as great aids to navigation. The hand-controlled steering wheel, shown in centre, was later supplemented by gyro-pilot control. 5. Radio position finder on the S.S. "Ile de France." The direction from which the land signals are being sent is ascertained by determining from what point of the compass signals are received with maximum intensity

NAVIGATION LAWS. Historically this expression refers to laws passed at various times and places to restrict commerce to ships of a particular nationality. But the expression is used in another sense to denote laws which lay down rules of the road and in other ways regulate the actual navigation of ships. The two classes will here be dealt with separately.

Restriction of Navigation.—In England the first Navigation act was passed in 1381. Policy varied thereafter until in 1651 a Navigation act was passed in order to strike a blow at the maritime supremacy of the Netherlands. The system set up of requiring the national trade by sea to be carried in ships under the national flag was maintained in force (with certain later statutory amendments) for a period of two centuries. By the Navigation acts ships under the national flag were required to be owned by British subjects, and shipmasters and a proportion of the seamen were also required to be British. Moreover, the national register for ships was established by Charles II in 1660 in order to ascertain which ships were to benefit from the acts.

The result of these acts was that by 1847 no produce from Asia, Africa or America could be imported into the United Kingdom from Europe in any ships, the object being that the trade should be direct and in British bottoms. Coastal trading around the United Kingdom could only be carried on by British ships, and colonial trade was prohibited to all foreign ships except where sanctioned by a special order in council. Various restrictions were imposed on imports not carried in British ships, and orders in council laid down differential dues and restrictions on imports carried in ships of any foreign countries imposing similar restrictions on British trade.

In 1849 the Navigation acts were repealed, subject to reservation of the coasting trade and subject to the proviso, intended to secure reciprocity, whereby if prohibitions or restrictions were imposed on British ships by other countries the privileges of the ships of those countries in British ports might be restricted. The reservation as to coasting trade was removed in 1854.

However, despite these relaxations, it is still the law that a ship is not to be deemed a British ship unless it is owned wholly by British subjects, or by a body corporate established in some part of the sovereign's dominions. British ships are still required to be registered as such. Further, no alien can own, nor, subject to certain reservations, may he act as master or as one of the principal officers of a British ship.

In the United States a system of duties discriminating against foreign ships was adopted in 1789. Under various statutes provision was made for relief by way of reciprocity, and consequently, after 1849, British ships were admitted to the United States ports on the same terms as American ships were admitted into British trade. But coastwise trade has continued to be limited to ships of the United States. Similar restrictions are placed on coastwise trade by some other countries, including France and Portugal. But many others, for example the Netherlands, Denmark and Sweden, permit coastwise trade to vessels of all nations which grant reciprocal privileges to ships carrying their flag.

After World War I, and in implementation of the terms of the peace treaty, conferences were convened under the auspices of the League of Nations with the object of facilitating and maintaining freedom of communications and of commerce. Several international conventions were adopted, the most important being the Maritime Ports convention, 1923, under which each of the contracting parties undertook, subject to the principle of reciprocity, to grant the vessels of every other contracting state equality of treatment with its own vessels or those of any other state whatsoever, in the maritime ports situated under its sovereignty or authority, as regards freedom of access to the port, the use of the port and the full enjoyment of the benefits as to navigation and commercial operations which it offers to vessels, their cargoes and passengers. This convention, however, does not apply to maritime coastal trade.

After World War II, the Provisional United Maritime Consultative council, consisting of 18 members, including the United Kingdom, the dominions and the United States, was set up at Washington, D.C., in 1946 for the purpose, *inter alia*, of removing all forms of discriminatory action and considering any shipping problem of international character. In 1948 a conference was held at Geneva at which the great majority of the members of the United Nations, with the notable exception of the U.S.S.R., were present. The conference adopted a convention for the constitution of an intergovernmental consultative organization, whose headquarters were to be in London, and whose objects were to follow the lines of those of the provisional consultative council. Its organs were to be an assembly, a council of 16, a maritime safety committee and a permanent secretariat.

Regulation of Navigation.—The other class of navigation laws laying down rules of the road and in other ways regulating the actual navigation of ships may apply (1) on the high seas, or (2) within territorial waters, ports, harbours, docks and inland navigable waters. (As to territorial jurisdiction in general *see* WATERS, TERRITORIAL.)

Customary rules of seamanship applicable to navigation on the high seas were gradually developed. In England the Trinity masters advised the judges as to the rules by which those in charge of a ship should be guided. In 1846 some Trinity house rules of navigation were made statutory. In 1889 an international maritime conference took place at Washington, D.C., the ultimate outcome of which was the drawing up of the International Regulations for Preventing Collisions at Sea. These have been adopted by all maritime nations and are thus of universal application. They are operative in respect of British ships everywhere and in respect of foreign ships when within British jurisdiction in the following way. The British Merchant Shipping acts empower the sovereign, by order in council to make regulations of this kind. This was done in 1896. Several further orders were made, and in 1910 the regulations were consolidated and reissued. As a result of the international convention for the safety of life at sea which was adopted at London in 1948, new International Regulations for Preventing Collisions at Sea were compiled, to come into operation as regards the United Kingdom at the beginning of 1954 and to supersede the 1910 regulations.

The collision regulations apply in general everywhere but they are subject in certain harbours and inland waters to qualifications introduced by local rules to adapt them to special local circumstances. These were made either in the same way as other national laws or by local authorities under powers given to them by the national legislature having jurisdiction over the place in question. Thus local rules are in force in many British and Irish ports and waterways, in the Danube and port of Sulina, in the Scheldt, at Gibraltar, in the Suez canal, in the United States inland waters and in the Great Lakes, both United States and Canadian.

McGuffie (London, 1953). (Ds. B.)

NAVY AND NAVIES. Originally the navy of a country meant the whole of its shipping, whether used for war, the carrying of merchandise or fishing. In modern parlance, however, the word is generally taken to mean a nation's warships and craft of every kind maintained for fighting on, under or over the sea and the personnel which mans them, *e.g.,* the royal navy consists of the surface warships—battleships, cruisers, aircraft carriers, destroyers, mine layers, mine sweepers, gunboats and other auxiliary craft; the submarines; and the fleet air arm. Behind the actual fighting units there is, necessarily, a vast organization for their administration and upkeep. *See* the sections *Defense* of the articles UNITED STATES; FRANCE; GERMANY and other countries; also such articles as ADMIRALTY; STAFF, NAVAL; DOCKYARDS AND NAVAL BASES.

History of Navies.—In early history we find navies in the form of the armed men of a tribe or town putting to sea in such large boats or ships as might be available to give battle to enemies similarly equipped or to raid territory from the sea. The craft themselves were for the most part those used for commerce, fishing or, when occasion served, for war or piracy. It was the exception that they were built especially for fighting purposes. But later we see special types of war craft designed as such beginning to assume a recognized place in the armoury of peoples and their sovereigns. Some of the earliest of what we should, today, term sea powers were the Phoenicians, Athenians, Carthaginians, Romans, Norsemen, Venetians, French and early English, but navies

in legendary form are to be found 2,000 years before they materialised in accredited records and the adventures of the Argonauts and of Ulysses would seem poetic forecasts of the age of the Vikings. In regard to the vessels themselves, there are definite indications of long ships built for speed as distinguished from round ships for burden from the time of the ancient Greeks and Romans. The Athenian navy was a state force and in 483 B.C. the threat of Persian attack caused Athens to increase her fleet from 50 to 100 long ships which were paid for out of the proceeds of the mines of Laureium (*see* THEMISTOCLES). The effect of this was to make Athens the predominating partner in the league formed by the Greeks for their common naval defence. By the end of the 5th century B.C. the fleet had increased to 300 long ships and later to as many as 360. In peace these war vessels were kept on slips and under cover in sheds; in war a *strategos* was appointed in command and he chose the trierarchs who were deputed to commission the vessels, partly at their own expense, under the supervision of State Inspectors.

In general the organization of the Athenian navy resembled closely that of the British navy in the 16th and 17th centuries. The trierarch, who was either one of a group of citizens assisting to finance one or more war vessels, or someone paid to discharge the duty, answered to the captain; there was a sailing master; a number of petty officers; seamen and oarsmen; while soldiers or marines formed the fighting personnel. The most ancient warships were many-oared galleys (*q.v.*), each requiring a very large number of rowers. The result was that the personnel provided to man a fleet of those times had to be a considerable one. For instance, the Roman and Carthaginian forces in the first Punic War numbered approximately 150,000 men on each side. These great rowing galleys relied for their offensive powers on boarding or ramming, and we see them in great numbers in the Mediterranean as the war fleets of the succession of Alexander, of Carthage, of Rome, of Byzantium, of the Italian Republics, of the Arabs and of Aragon. (*See* also SHIP.)

In the naval organization of ancient Rome we see the beginning of the idea of an Admiralty in the navy commissioners appointed in 311 B.C. It is interesting to note, too, that the Roman Empire was faced, on a small scale, with maritime problems which have assumed such vast importance to the British Empire of to-day. Not only had Rome to maintain a fleet to neutralize the threat arising from rival sea powers, but sea-borne trade was of such importance as to compel her to provide a navy capable of dealing with prevalent piracy and the needful safeguarding of routes. This organization, which was very complete, included two main fleets which guarded the coasts of Italy at Ravenna and Misenum. These were known as the Praetorian. Other squadrons were allocated to Forum Julii, to the mouth of the Orontes, to Alexandria, to Carpathus (between Crete and Rhodes), to Aquileia (at the head of the Adriatic), to the Black Sea and to Britain. River flotillas were stationed on the Rhine and Danube and, later, on the Euphrates. All these squadrons did not exist at the same time, but there was always a highly organized navy with a body of soldiers, the *classici,* specially assigned for service afloat.

The navy of the Eastern Empire may be said to have originated with the foundation of Constantine's New Rome on the site of Byzantium. The threat of attack from the Vandal kingdom of Carthage (from A.D. 428 to 524) compelled the Emperors to attend to their fleet, but with the fall of that kingdom the navy was neglected until the rise of Mohammedan power at the end of the 7th century produced a new menace. The Byzantine navy reached a high state of efficiency under the sovereigns of the Macedonian dynasty (867–1056). It consisted of an Imperial fleet commanded by the Great Drungarios, the first recorded Lord High Admiral, and of provincial squadrons under their *strategoi.* The Imperial Fleet was essentially a war organization, while the provincial or thematic squadrons were smaller but more permanent forces maintained for police purposes. It is interesting to note that this navy included a corps corresponding to the gunnery experts of a modern fleet. These were the *siphonarioi,* who worked the *siphons* used for discharging the "Greek fire."

After the disorganization of the Eastern Empire by Turkish invasions in the 12th century, the Byzantine navy withered. In the middle ages the Italian republics and monarchial states bordering on the Mediterranean possessed appreciable fleets, and their seamen, especially those of Genoa, were regarded as some of the first in the world, so much so that their services were sought by the powers of Western Europe and even by England. Edward III. and the kings of France employed Genoese to assist them in nautical matters.

The Mediterranean navies made their last great appearance in history at the Battle of Lepanto, 1571 (*q.v.*). From thence onwards the scene of naval activity changed and the ships and fleets took upon themselves a new form, and one to fit them for ocean sailing and fighting. The history of the growth of modern great navies will be found under their respective countries. (E. A.)

BIBLIOGRAPHY.—*Ancient and General.*—Accounts of the naval organizations of the ancient world, and of the sea fighting of the time are to be found in the histories of Greece and Rome: G. Corazzini has written a *Storia della marina militare antica* (Livorno, 1882). Valuable details of the Imperial Roman navy and of the Byzantine navy will be found in Prof. J. B. Bury's appendices to his edition of Gibbon's *Decline and Fall,* vol. i. apx. 5, and vol. vi. apx. 5 (1896–1900). *See* also A. T. Mahan, *Influence of Sea Power on History, 1660–1783* (1890).

For *United States* see UNITED STATES OF AMERICA, *Navy.*

Mediaeval.—As regards the mediaeval navies the first place may be allowed to the Italians. A general bibliography of Italian nautical literature *Saggio de una bibliografia marittima italiana,* occupying fifty-eight pages, drawn up by E. Celani, will be found in the *Revista marittima,* supplement for 1894. The histories of the different Republics of the middle ages record their maritime enterprises. An excellent book, which gives far more than its title promises, is the *Storia della marina pontificia* of A. Guglielmotti, O.P., in 10 volumes published at different times, and in two editions, at Florence 1856, etc. The general maritime history of the Mediterranean in the middle ages is well illustrated in the *Memorias sobre la marina comercio y artes de Barcelona* (1779–1792) by A. Capmany. The naval enterprises of the Norsemen are dealt with in a scholarly fashion by G. B. Depping, *Histoire des expéditions maritimes des Normands* (1826); and with newer knowledge by C. F. Keary, *The Vikings of Western Christendom* (1891).

Great Britain.—*The History of the Royal Navy to the French Revolution,* by Sir N. Harris Nicolas (1847), is unfortunately incomplete. It ends at the year 1422, but is the work of a most laborious and exact antiquary, who had been a naval officer in his youth. The administrative history of the British navy until 1660 is the subject of the *History of the Administration of the Navy and of Merchant Shipping in relation to the Navy* (1896) by M. Oppenheim—a most valuable collection of materials. *The Naval History of England* (1735) by T. Lediard, is copious and useful. The *Naval Chronology, or an Historical Summary of Naval and Maritime Events from the Time of the Romans to the Treaty of Peace 1802,* by Captain I. Schomberg (1802), contains a mass of valuable information, lists of ships, dates of construction, etc., and some administrative details. A good book is *The Naval and Military Memoirs of Great Britain 1727 to 1783* (1804) by R. Beatson, a very careful and well-informed writer who had seen some service as a marine officer. The *Naval History of Great Britain,* from 1793 to the accession of George IV., by W. James (1827), republished with a continuation by Chamier in 1837, is a standard authority. The *History of the British Navy from the Earliest Period to the Present Time* (1863) by C. D. Yonge, contains some original matter for the naval transactions of the 19th century. *The Royal Navy,* 7 vols. (1897–1903), edited and partly written by Sir W. L. Clowes, is a compilation of unequal value. Some of Sir W. L. Clowes's coadjutors, notably Captain Mahan and Sir C. R. Markham, are of high standing and authority. *The Naval Chronicle,* 1799–1818, a magazine, contains useful matter, for the Revolutionary and Napoleonic Wars. *The Naval Biographical Dictionary; life and services of every living officer* (1846), by W. R. O'Bryne, is a solid book of reference. The publications of the Navy Record Society (1894 and subsequent years) contain large and valuable publications of original matter, with some reprints of old authorities, such as Sir W. Monson's *Tracts,* which were difficult of access. *See* also *A Short History of the Royal Navy,* by D. Hannay; *Official History of the War:* "Naval Operations" (1920, etc.); G. Callender, *The Naval Side of British History* (1924); G. F. S. Bowles, *The Strength of England* (1926).

France.—Léon Guérin, *Histoire maritime de la France* (1844). The *Histoire de la marine française* of Le Comte de Bonfils Lablénie (1845), a naval officer, is of value. *La Marine de guerre, ses institutions militaires depuis son origine jusqu'à nos jours,* by Capne Gougeard (1877); the *Essai sur l'histoire de l'administration de la marine française* of Lambert de Sainte Croix (1892); and the excellent little book of M. Loir on *La Marine royale, 1789* (n.d.), may be consulted with pleasure and profit. The three books of A. Jal, *Archéologie navale* (1840), *Glossaire nautique* (1848) and *Abraham du Quesne et la marine de son temps* (1872) are all of high value. *Les Batailles navales de la France* of O. Troude (1867), is a carefully written account of naval actions

The *Histoire de la marine française, pendant la guerre de l'indépendence américaine* (1877); *Sous la première république* (1886); *Sous le consulat et l'empire* (1886); *De 1815 à 1870* (1900); and *La Marine française et la marine allemande, 1870–1871* (1873) of E. Chevalier, are thorough and critical. G. Lacour-Gayet, Professor at L'École supérieure de la Marine, has published two books of serious research, *La Marine militaire de la France sous le règne de Louis XV* (1902), and *La Marine militaire de la France sous le règne de Louis XVI* (1905). The *Recherches sur l'ancien clos des galées de Rouen* (1864) of C. de Robillard de Beaurepaire, and the life of *Jean de Vienne* by the Marquis Terrier de Loray (1878), are valuable monographs on passages of early French naval history. The *Projets et tentatives de débarquement aux Iles britanniques* by E. Desbrière (1900 *et seq.*) is a most valuable authority. A very scholarly *Histoire de la marine française* was begun in 1899 by M. C. de la Roncière.

See also the standard authorities for Spanish naval history, *La Marina de Castilla* (1892), and *La Armada Española desde la union de Castilla y Aragon* (1895–1901), of C. Fernandez Duro. J. C. de Jonghe, *Geschienes van het Nederlandsche Zeewezen* (1858), is an admirable and exhaustive history of the Dutch navy. *The History of the Maritime Wars of the Turks,* by Haji Khalfa (or Hugji Chalifa), tr. J. Mitchell for the Oriental Translation Fund (1831), may be read with curiosity and some profit. There are two general histories of the navy of the United States by Fenimore Cooper (1839) and by E. S. Maclay (1894); the second is the fuller, and the more critical. The monographs by Adm. Jurien de la Gravière, covering the whole field of naval warfare from the Peloponnesian War to his own time, contain much information and sound criticism.

NAVY DEPARTMENT: *see* GOVERNMENT DEPARTMENTS.

NAWABGANJ, the name of three towns of India. (1) The most important is the headquarters of Bara Banki district, central Uttar Pradesh, 17 mi. E. of Lucknow; pop. (1941) 18,207. It has a considerable trade in sugar and cotton goods. It was the scene of a victory by Sir James Hope Grant during the Indian Mutiny of 1857. (2) A town in Gonda district, Uttar Pradesh, pop. (1941) 5,662. (3) A town in Bareilly district, Uttar Pradesh, pop. 4,577.

NAWANAGAR or JAMNAGAR, a native state of the United State of Saurashtra, India, situated on the south of the Gulf of Cutch. Area, 3,791 sq.mi. Pop. (1941) 504,006. Maharaja Jam Shri Digvijayasinhji Saheb became chief in April 1933. Grain, cotton and oilseeds are produced there. Marble and copper are found, and there is a pearl fishery in the Gulf of Cutch. The town of Jamnagar is about 5 mi. from the seaport of Bedi. Pop. (1941) 71,588.

Founded by Jam Rawal in 1540, Nawanagar is built of stone, has manufactures of silk and gold embroidery and locomotive works and is well known for its dyeing. Its water is supplied from a reservoir covering 600 ac. and an aqueduct 8 mi. long.

Nawanagar became one of the jurisdictional states of the United State of Saurashtra, established in April 1948.

NAXOS, the largest of the Cyclades (about 22 mi. by 16 mi.), east of Paros, with which, and adjacent smaller islands, it forms an *eparchia.* In early times it was also called Dia or Strongyle. Rich in vines and famous for its wine, it was a centre of the worship of Bacchus. The god found Ariadne asleep on its shore, when she was deserted by Theseus. The sculptors of Naxos were important in early Greek art; unfinished statues are still to be seen in the quarries, notably the colossal one in Apollona bay, to the northeast. During the 6th century B.C. a tyrant Lygdamis ruled Naxos in alliance with Peisistratus of Athens. In 501 a Persian fleet attacked it unsuccessfully, but in 490 it was captured and treated with severity. Four Naxian ships joined the expedition of Xerxes, but deserted to the Greek side at Salamis in 480. Naxos was a member of the Delian league (*q.v.*); but, revolting in 471, was captured by Athens, and remained in her possession till her fall. In later times after its capture, in A.D. 1207, by the Venetian, Marco Sanudo, the duchy of Naxos flourished till the Turks took the island in 1566. After the War of Independence it belonged to the Greek kingdom. The ancient remains of a temple (*Palati*), supposed to be that of Dionysus, are on an island just off the town. Naxos is rich in fruit trees, and exports corn, wine and oil, but its most important product is emery. The population is about 17,000.

NAXOS, the earliest Greek colony in Sicily, was founded by Theocles from Chalcis in *c.* 734 B.C., on the east coast, south of Tauromenium (modern Taormina), just north of the mouth of the river Alcantara, where the castle of Schiso now stands. As there were already Sicels at Tauromenium, they cannot have offered any opposition. The adoption of the name of Naxos, the island in the Aegean sea, may show that there were Naxians among its founders. It soon founded Leontini and Catana. Naxos was the warmest ally of Athens in the Sicilian expedition. In 403 B.C. it was destroyed by Dionysius and its territory given to the Sicels. Its exiles at last found refuge in 358 at Tauromenium. Scanty traces of its walls are to be seen.

NAYAR (NAIR), the dominant lay caste in Malabar, on the west coast of southern India. The Nairs were originally a militia, the name being a form of Sanskrit *nāyaka,* "leader," as is Tamil *nāyadu, naidu;* but many Nairs now enter civil professions. The caste is split up into numerous groups of varying status, but all are or were curiously submissive to the Nambūtiri Brahmans.

To the Nair, as a soldier or marine, marriage was forbidden, and a Nair woman was therefore ritually married to anyone, even a stranger, merely as a form. After that she could be united to a Nambūtiri or a Nair, not below her in group status, by the *sambandham* ceremony. It would seem that once she was permitted to have several such husbands, not necessarily brothers, at a time. But, strictly speaking, polyandry did not exist, and it is now probably as extinct in fact as in theory. The *sambandham* became monogamous and usually permanent. From the custom, however, descent in the female line naturally ensued, and it involved also inheritance in that line, a man's heir-at-law being his (uterine) sister's son. But a woman's property was managed by the senior male of her own kin. To remedy the evils of this system the Malabar Marriage act of 1896 enabled *sambandhams* to be registered as binding and permanent marriages, but little advantage has been taken of the statute, as it merely legalized the prevailing custom.

E. Thurston, *Castes and Tribes of Southern India,* vol. v (1905), is exhaustive; Moore, *Malabar Law and Custom* (1905).

NAYARIT, a Pacific state of Mexico, until 1917 the territory of Tepic, bounded by Sinaloa, Durango and Jalisco. Area, 10,442 sq.mi. Pop. (1950) 292,343, chiefly mestizos and Indians. The Southern Pacific of Mexico railway and the trunk highway from Nogales to Guadalajara cross Nayarit. Running southeasterly, the Sierra Madre rises steeply from the narrow Pacific littoral and cuts the state into deep gorges and narrow valleys. Its climate is generally wet, frost-free and healthful except on the hot Pacific slope. The main river is the final leg of the Rio Lerma, rising on the main plateau of Mexico; under the name of Santiago it flows westward through Nayarit and empties north of San Blas, chief Pacific port. Its valley is extremely fertile.

Mining is important in the sierras, but Nayarit is primarily agricultural; its products include tobacco, sugar, cotton, beans, coffee, woods and medicinal plants. After its market roads were expanded from 10 mi. to 520 mi. between 1945 and 1950, its output of maize increased from 30,000 tons to 178,000, half of it is shipped to Mexico City; the number of tractors increased from 15 to 450 in the same period.

Tepic (est. pop. 1950, 30,000) is the capital, 26 mi. S.E. of San Blas, with which it is connected by road. It is built on a small plateau 3,000 ft. above sea level, a quiet colonial town surrounded by ranches and small farms. Small villages of Cora and Huichol Indians are scattered through the sierras. (HD. C.)

NAYLER or **NAYLOR, JAMES** (1618–1660), English Puritan, was born at Andersloe or Ardsley, in Yorkshire, in 1618. In 1642 he joined the parliamentary army, and served as quartermaster in John Lambert's horse. In 1651 he became a Quaker. He gradually arrived at the conviction that he was a new incarnation of Christ. He gathered round him a small band of disciples, who followed him from place to place. At Appleby in 1653 and again at Exeter in 1655 he suffered terms of imprisonment. In Oct. 1655, in imitation of Christ's procession into Jerusalem, he entered Bristol on horseback riding single—"a rawboned rude figure, with lank hair reaching below his cheeks"—attended by seven followers, some on horseback, some on foot, he in silence and they singing "Hosanna! Holy, holy! Lord God

of Sabaoth!" At the High Cross he and his followers were arrested. His trial occupied the second parliament of Cromwell for several days, and on Dec. 16, 1656, he was convicted of blasphemy and sentenced to be whipped, to be branded in the forehead with "B" (for blasphemer), to have his tongue bored with a red-hot iron, to be whipped through the streets and to suffer imprisonment for two years. On his release he was readmitted into the communion of the Quakers.

See E. Fogelklou, *James Nayler, The Rebel Saint* (London, 1931).

NAZARENE, CHURCH OF THE, a religious body based on the theological doctrines of holiness and sanctification as expounded by John Wesley in the 18th century. At mid-20th century, it had approximately 3,000 churches in the United States with a membership of more than 200,000.

Earlier this church was known as the Pentecostal Church of the Nazarene, a religious body formed in 1907 when the Association of Pentecostal Churches in America (organized in northeastern United States, 1894–96) merged with the Church of the Nazarene (organized in California in 1895). In 1908 the Holiness Church of Christ, organized in Texas in 1904, joined the union; and in 1915 the Pentecostal Mission, which was first organized in Tennessee in 1898 as the Pentecostal Alliance, also joined. The word "Pentecostal" was dropped from the name of the church in 1919 and it became known as the Church of the Nazarene.

Doctrines of the church emphasize sanctification as a work of grace following regeneration. Members believe that the Bible contains all truth necessary for Christian faith and living. The second coming of Christ, the resurrection of the dead, and the final judgment of the Lord are also precepts of the church. The sacraments of baptism and the Lord's Supper are recognized. (*See* WESLEY, JOHN and WESLEYAN METHODIST CHURCH.)

NAZARENES, an obscure Jewish-Christian sect, existing at the time of Epiphanius (*fl.* A.D. 370) in Coele-Syria, Decapolis, (Pella) and Basanitis (Cocabe). According to him (*Panarion*, xxix, 7) they dated their settlement in Pella from immediately before the siege in A.D. 70; he characterizes them as neither more nor less than Jews pure and simple, but adds that they recognized the new covenant as well as the old, and believed in the resurrection, and in the one God and His Son Jesus Christ. Recent investigation leads to the conclusion that the Nazarenes of the 4th century are to be identified with the Ebionites (*q.v.*).

NAZARETH, a town of Lower Galilee, on the northern border of the plain of Esdraelon, 1,600 ft. above sea level. Population in 1931 was 8,756 (3,226 Moslems, 5,445 Christians); 1939 estimate, 10,100. The industries are lace-knitting, and the manufacture of mementoes for sale to tourists.

Nazareth is not mentioned in the Old Testament. It first became known as the place where Jesus spent his youth. The village was the home of Joseph and Mary, and to it they returned after the flight to Egypt. In its synagogue Jesus preached the sermon that led to his rejection by his fellow-townsmen. A mass of legends and precarious identifications has grown up with the ages. A sample of the soil in which they took root and flourished may be here given. Antoninus Martyr, who visited Palestine in A.D. 570, tells us: "In the synagogue there is still the book from which our Lord was set to learn A.B.C. In the synagogue, too, is the bench upon which our Lord sat with the other children. This bench can be moved and lifted up by Christians; but Jews cannot at all stir it, nor does it permit itself to be carried out of doors." Today visitors are shown the church of the Annunciation, the workshop of Joseph, St. Mary's well, Christ's table, the place of precipitation, etc. Only for the well can authenticity be assured.

The Crusaders captured Nazareth in 1100 and transferred there the bishopric of Scythopolis (Beisān). It was taken by Saladin (1187) and retaken by Frederick II (1229). On its capture by Beibars (1263), the Christian inhabitants were massacred. In 1517 it came into the possession of the Turks. In World War I Nazareth was the headquarters of the Turco-German army. It was captured by British cavalry Sept. 20, 1918. (E. Ro.)

NAZARETH, a borough of Northampton county, Pennsylvania, U.S., 7 mi. N.W. of Easton; served by the Lehigh and New England, D.L. & W. railways. Pop. (1950) 5,830. It has cement works and factories for textiles, musical instruments, paper products, steel, etc. It was founded by the Moravians in 1740.

NAZARITE or, better, NAZIRITE, the name given by the Hebrews to a peculiar kind of devotee. The characteristic marks of a Nazarite were unshorn locks and abstinence from wine (Judges xiii, 5; 1 Sam. i, 11; Amos ii, 11 *et seq.*); but full regulations for the legal observance of the Nazarite vow are given in Num. vi, where every product of the grape-vine is forbidden, and the Nazarite is enjoined not to approach a dead body. The law contemplates the assumption of the vow for a limited period only, and gives particular details as to the atoning ceremonies at the sanctuary by which the vow must be recommenced if broken by accidental defilement. On the expiry of his vow the Nazarite cuts off his hair and burns it on the altar, thus returning to ordinary life. In the earliest historical case, that of Samson, and in the similar case of Samuel (who, however, is not called a Nazarite), the head remains unshorn throughout life, and in these times the ceremonial observances as to uncleanness must have been less precise; *e.g.*, Samson touches the carcass of a lion.

In the cases of Samuel and Samson the unshorn locks are a mark of consecration to God (Judges xiii, 5) for a particular service. Since, moreover, the Hebrew root *n-z-r* is only dialectically different from *n-d-r*, "to vow," both corresponding to the same original Semitic root (Arab. *n-dh-r*), it would seem that the peculiar marks of the Nazarite are primarily no more than the usual sign that a man is under a vow of some kind. To leave the locks unshorn during an arduous undertaking in which the divine was specially implored and to consecrate the hair after success was a practice among various ancient nations, but the closest parallel to the Hebrew custom is found in Arabia. There the vow was generally one of war or revenge, and, till it was accomplished, the man who vowed left his hair unshorn and unkempt, and abstained from wine, women, ointment and perfume. At one time the Nazarites probably had an importance—perhaps even an organization—parallel to that of the prophets, but of a very different religious type from the Canaanite nature-worship. (*See* RECHABITES.)

Gray, *Critical and Exegetical Commentary on Numbers*, pp. 56–61 (1903). (W. R. S.)

NAZARIUS (4th century A.D.), Latin rhetorician and panegyrist, was, according to Ausonius, a professor of rhetoric at Burdigala (Bordeaux). The extant speech of which he is considered the author (in E. Bährens, *Panegyrici Latini*, No. 10) was delivered in 321 to celebrate the 15th anniversary of the accession of Constantine the Great, and the fifth of his son Constantine's admission to the rank of Caesar. The preceding speech (No. 9), celebrating the victory of Constantine over Maxentius, delivered in 313 at Augusta Trevirorum (Trier), has been often attributed to Nazarius, but the differences in style and vocabulary, and the more distinctly Christian colouring of Nazarius' speech, were often cited to refute this theory.

His work is discussed in Teuffel-Schwabe's *History of Roman Literature* (Eng. trans. 1900).

NAZI, a popular abbreviation for a member of Adolf Hitler's National Socialist German Workingmen's party (*Nationalsozialistische Deutsche Arbeiterpartei*, commonly designated by its initials, NSDAP). The nickname originated from the German pronunciation of the first two syllables of "National." (*See* NATIONAL SOCIALISM.)

NEAGH, LOUGH, the largest lake in the British Isles, situated in Northern Ireland. It has an area of 148 sq.mi. and a catchment area of 2,200 sq.mi. The hollow in which it lies was caused by the collapse of a corner of the basalt plateau which covers much of County Antrim. Its waters are divided among the five counties of Antrim, Down, Armagh, Tyrone and Londonderry. Its shape is an irregular oblong, its extreme measurements being 18 mi. from northeast to southwest, 16 mi. from north to south and 11 mi. from east to west.

The Bann river flows through the lake and is its sole outlet

northward to the sea. Under the Drainage act of 1929, the ministry of finance, Northern Ireland, was established as the drainage authority for the Lough Neagh district. A big scheme was begun in 1930 for deepening and widening the Bann river along the 32 mi. from the outlet of Lough Neagh to its tidal reaches. This ensured that 700,000 cu.ft. of water per minute could be discharged and the flood level of the lake kept below 53 ft. 6 in. above sea level. (Hu. S.)

NEALE, EDWARD VANSITTART (1810–1892), English co-operator and Christian Socialist, was born at Bath on April 2, 1810, the son of a Buckinghamshire clergyman. He studied at Oriel college, Oxford, was called to the bar at Lincoln's Inn in 1837, became a member of the Christian Socialists in 1850 and also joined the council of the Society for Promoting Working Men's Associations. He founded the first co-operative store in London, and advanced the capital for two builders' associations, both of which failed. In 1851, though strongly opposed by other members of the promoting "Council," he started on his own initiative the Central Co-operative Agency, similar in many respects to the Co-operative Wholesale Society of a later day. The failure of this scheme, together with that of the operatives' cause in the engineering lock-out of 1852 is said to have cost him £40,000. He was closely associated with the movement which resulted in the Industrial and Provident Societies Act of 1876, and the passing of the Consolidation Act of 1862 was almost entirely due to his efforts. Besides publishing pamphlets on cooperation he served on the executive committee which afterwards developed into the Central Co-operative Board, and took an active part in the formation of the North of England Co-operative Wholesale Society in 1863. One of the founders of the Cobden mills in 1866, and the Agricultural and Horticultural Association in 1867, he also promoted the annual co-operative congress. He was also a director of the Co-operative Insurance Company and a member of the Co-operative Newspaper Society. He visited America in 1875 with a deputation whose object was to open up a direct trade between farmers of the western States and English co-operative stores. He died on Sept. 16, 1892.

NEALE, JOHN MASON (1818–1866), English divine and scholar, was born in London on Jan. 24, 1818, and was educated at Trinity college, Cambridge. He occupies a high place as a hymnologist, but principally as a translator of ancient and mediaeval hymns, the best known being probably "Brief life is here our portion," "To thee, O dear, dear country," and "Jerusalem, the golden," which are included in the poem of Bernard of Cluny, *De Contemptu Mundi,* translated by him in full. He also published *An Introduction to the History of the Holy Eastern Church* (1850, 2 vols.); and other works. His *Collected Hymns* were published in 1914.

See *Letters of John Mason Neale* (1910), selected and edited by his daughter Mrs. C. Towle, who also wrote his *Life* (1907).

NEANDER, JOHANN AUGUST WILHELM (1789–1850), German theologian and Church historian, was born at Göttingen on Jan. 17, 1789, of poor Jewish parents named Mendel. He graecized his name into Neander on his baptism in 1806. Educated under Schleiermacher, he became professor at Heidelberg in 1812 and removed to Berlin in 1813. His learning, sympathies, and personality attracted many students, and he did perhaps more than any other teacher to bring a less formal spirit into Lutheran teaching. He died on July 14, 1850.

NEANDERTHAL MAN. The cave in which the Neanderthal bones were discovered in 1856, is in the valley of the Düssel, a tributary of the Rhine. The bones found, the vault of the skull, upper and lower arm bones, both thigh bones and portions of the shoulder blade, pelvis and ribs, belonged to a separate species —which is represented by remains found in Jersey, in France, Belgium, Spain (Gibraltar), Italy, Croatia, Russia, Czechoslovakia and Palestine. The normal skull of this species was large but low, with retreating forehead and massive brow ridges forming a shelflike ridge. The back part of the skull was somewhat flattened, so that the head must have appeared as set on a thick bull neck. The chin was receding. The teeth and palate were specialized in form and point to a rough diet. The thigh bones had thick curved shafts. Neanderthal man, an aberrant side line in evolution, became extinct about 50,000 years ago. Associated flint implements are known as Mousterian (Middle Palaeolithic).

See Sir A. Keith, *The Antiquity of Man,* 2nd ed. (1929); W. E. Le Gros Clark, *History of the Primates,* British Museum (Natural History), 2nd ed. rev. (London, 1953). (K. P. O.)

NEAP, a word only used of tides in which the high-water mark is at its lowest, as opposed to "spring tides" (*see* TIDES). The word is obscure in origin.

NEARCHUS, one of the officers in the army of Alexander the Great. A native of Crete, he settled at Amphipolis in Macedonia. In 325, when Alexander descended the Indus to the sea, he ordered Nearchus to conduct the fleet to the head of the Persian gulf. Nearchus was then entrusted with the more difficult task of circumnavigating Arabia from the mouth of the Euphrates to the Isthmus of Suez, a project cut short by the death of the king (323). In the troubles that followed, Nearchus attached himself to Antigonus, under whom he held the government of his old provinces of Lycia and Pamphylia.

He wrote a detailed narrative of his expedition, of which a full abstract was embodied by Arrian in his *Indica.*

For the text *see* editions of Arrian by C. Müller in *Geographici Graeci minores,* i (Paris, 1855), and by A. G. Roos, *Arrianus,* ii, in the Teubner series (Leipzig, 1928); on the topography *see* W. Tomaschek, "Topographische Erläuterung der Küstenfahrt Nearchs vom Indus bis zum Euphrat," in *Sitzungsberichte der K. u. K. Acad. der Wissenschaften,* cxxi (Vienna, 1890). *See* also E. H. Bunbury, *History of Ancient Geography,* i, ch. 13 (London, 1879); T. S. Brown, *Onesicritus* (Berkeley, Calif., 1949); and ALEXANDER III, THE GREAT. For ancient authorities *see* F. Jacoby, *Fragmente der griechischen Historiker,* IIB, IID (Berlin, 1923 ff.).

NEATH (Welsh, *Castell-Nêdd*), a municipal borough and market-town of Glamorganshire, South Wales, situated near the mouth of the Neath or Nêdd, on the G.W.R., 7½ mi. E.N.E. of Swansea. Pop. (1951) 32,305. Area, 6.8 sq.mi.

The town perhaps occupies the site of the Roman Nidum on the Julia Maritima from which a vicinal road branched off here for Brecon. At the Norman conquest of Glamorgan, Fitz Hamon gave the district between the Neath and the Tawe to Richard de Granville, who built on the west banks of the Neath first a castle and then in 1129 a Cistercian abbey, to whose monks he later gave all his possessions in the district. All traces of this castle have disappeared. Another castle, built in the same century, on the east bank, was held direct by the lords of Glamorgan, as the westernmost outpost of their lordship. It was frequently attacked by the Welsh, notably in 1231 when it was taken, and the town demolished by Llewelyn ap Iorwerth. The portcullis gate and a tower are all that remain of it; of the abbey there still exist the external walls, with parts of the chapel, vaulted chapter-house, refectory and abbot's house. Neath is a borough by prescription and received its first charter in the 12th century from William, earl of Gloucester, who granted its burgesses the same customs as those of Cardiff. Other charters were granted to it by successive lords of Glamorgan in 1290, 1340, 1359, 1397, 1421 and 1423. By the first of these (1290) the town was granted a fair on St. Margaret's Day (July 20) and as the abbey had extensive sheep walks the trade in wool was considerable. In 1685 James II. granted a further charter. At the Dissolution the abbey and the manor of Cadoxton (part of its possessions) were sold to Sir Richard Williams or Cromwell. Copper smelting has been carried on in or near the town since 1584 when the Mines Royal Society set up works at Neath Abbey; the industry attained huge proportions a century later under Sir Humphrey Mackworth, who from 1695 carried on copper and lead smelting at Melincrythan. With the development of the South Wales coalfield Neath continued its metallurgical associations and concentrated on the by-product industries, thus locally diminishing to some extent the marked depression that characterized this coalfield after the collapse of the post-war boom in 1921–22. Besides the copper works the town possesses tinplate, steel and galvanized sheet works, foundries and engineering works. In the neighbourhood there are numerous collieries. The Neath Canal, from the upper part of the Vale of Neath to Briton Ferry (13 mi.), passes through the town, which is also connected with Swansea by another canal.

One timé independent railway lines now form important branches of the G.W.R. to the Rhondda, Aberdare and Brecon respectively.

NEBO or Nabu ("the proclaimer"), the Accadian translation of various Sumerian ideograms for the god of wisdom and writing, the main seat of whose worship was at Borsippa—southwest of Babylon. It is because of the close association of Borsippa with Babylon after the period when Babylon became the centre of the Babylonian empire that the cult of Nebo retained a prominence only some degrees less than that of Marduk. The amicable relationship between the two was expressed by making Nebo the son of Marduk. In this case the expression of the relationship in this form was intended to symbolize the superiority of Marduk, different, therefore, from the view involved in making Marduk the son of Ea (*q.v.*), which meant that the prerogatives of Ea were transferred to Marduk by the priests of Babylon.

Nebo was the god of wisdom to whom more particularly the introduction of writing was ascribed. He takes his place, therefore, by the side of Ea as a cultural deity. The wisdom associated with him had largely to do with the interpretation of the movements in the heavens, and the priests of Nebo at an early age must have acquired widespread fame as astrologers. Assuming now, for which there is a reasonable amount of confirmatory evidence, that the priestly school of Nebo had acquired a commanding position before Babylon rose to political importance, we can understand why the worshippers of Marduk persisted in paying homage to Nebo, and found a means of doing so without lowering the dignity and standing of their own god. If Assur-bani-pal, the king of Assyria (668–626 B.C.), in the subscripts to the copies of Babylonian literary tablets invokes as he invariably does Nebo and his consort Tashmit as the gods of writing to whom all wisdom is traced, it is fair to assume that in so doing he was following ancient tradition and that the priests of Marduk likewise were dependent upon the school at Borsippa for their knowledge and wisdom.

The temple school at Borsippa continued to flourish until the end of the neo-Babylonian empire, and school texts of various contents, dated in the reigns of Artaxerxes, Cambyses and Darius, furnish the evidence that the school survived even the conquest of Babylonia by Cyrus (539 B.C.). Originally this Sumerian deity seems to have been connected with Dilmun and was often identified with the philosophic principle *mummu;* creative word, form. As such he is the son of the water god Enki (Ea), god of the first principle, water. As the god of writing, Nebo has charge of the tables of fate on which he inscribes the names of men and decides what their lot is to be. If in the systematized religious system, Marduk appears as the arbiter of human fates, the conclusion is warranted that Marduk is here imbued with the authority which originally was in the hands of his son. A reconciliation between the rival claims was effected by continuing Nebo in the role of scribe, but as writing at the dictation of the gods, thus recording what the divine assembly, gathered in the chamber of fates (known as ubshukinna) within the precincts of E-Saggila—Marduk's temple at Babylon—under the presidency of Marduk, had decided.

Nebo also does homage to his father by paying him an annual visit during the new year celebration, when the god was solemnly carried across to Babylon, and in return Marduk accompanied his son part way back to his shrine at Borsippa. Within E-Saggila, Nebo had a sanctuary known, as was his chief temple at Borsippa, as E-Zida, "the legitimate (or 'firm') house." The kings, and more particularly those of the neo-Babylonian dynasty, devote themselves assiduously to the worship and embellishment of both E-Saggila and E-Zida. In their inscriptions Marduk and Nebo are invoked together and the names of the two temples constantly placed side by side. The symbols of the two gods are similarly combined. On boundary stones and cylinders, when Marduk's symbol—the lance—is depicted, Nebo's symbol—the stylus—is generally found adjacent. In astronomy he was identified with the planet Mercury, and with the principal star of Taurus, Aldebaran. In the official reports of astrologers and in official letters, Nebo is even mentioned before Marduk without fear of thereby offending the pride of the priests of Marduk.

His consort, known as Tashmit, plays no independent part, and is rarely invoked except in connection with Nebo.

See also Babylon, Borsippa, Babylonian and Assyrian Religion.

Bibliography.—J. Pinckert, *Hymnen und Gebete an Nebo* (Leipzig, 1920), which given references to earlier monographs on Nebo. He is often mentioned in the Old Testament, for which *see* H. Langdon, "The Babylonian Conception of the Logos," *Journal of the Royal Asiatic Society,* part ii (1918). (S. L.)

NEBRASKA, styled the "Tree Planter's state" by act of the legislature, 1895, and renamed the "Cornhusker state" by legislative act in 1945, is near the centre of the U.S., lying approximately between 40° and 43° N. lat. and 95° and 104° W. long. It is bounded on the north by South Dakota, on the east by Iowa and a corner of Missouri, on the south by Kansas, on the south and west by a corner of Colorado and on the west by Wyoming. The Missouri river flows along the eastern and northeastern border. The extreme length of the state is about 430 mi. and the extreme breadth about 210 mi. The area is 77,227 sq.mi., of which 564 are water surface. Nebraska was named "Tree Planters' state" because Arbor day was originated by J. Sterling Morton, and forestry was emphasized by its pioneers and their successors. The name "Cornhusker" originally was applied to the University of Nebraska football team.

Physical Features.—The main feature of Nebraska topography is a great undulating plain, sloping gradually from the northwest to the southeast, at an average of ten feet per mile. This plain is broken along its northern and eastern borders by hilly regions of varied character. The highest point, 5,340 ft., is in Banner county. The point of lowest elevation is 825 ft. in Richardson county, at the southeastern corner. The mean elevation is about 2,500 ft.

The United States and state topographical surveys classify Nebraska into four regions: the loess, the sand hills, the high plains, and the Bad Lands, with lowlands along the Missouri and Platte rivers.

The loess region includes about 42,000 sq.mi. of the best farming region in the eastern, central and southern parts of the state. In the loess plains the landscapes flow in a series of long gentle waves toward the southeast. Along the Missouri, the Republican and at some points elsewhere the waves converge into moderate hills. The sand-hill region lies west and northwest of the loess plains, like an open fan with the handle toward the northeast. The main region includes about 18,000 sq.mi., with outlying areas dotting other parts of the state. Scattered through the sand hills are rich valleys, lakes and fertile tablelands. The sand hills themselves are for the most part a series of sloping hills, rising sometimes into pinnacles, at other times stretching in gentle plains. Their general height is from 25 to 100 ft. above the valleys between.

West and northwest of the sand hills lie the high plains, mostly level stretches of tableland, broken occasionally by deep canyons. In this region are about 12,000 sq.mi. Included in this region are two areas of evergreen wooded mountains, the Wild Cat range, in Scotts Bluff and Banner counties and the Pine Ridge in Sheridan, Dawes and Sioux counties. Conspicuous features of these high plains are the buttes, isolated rugged hills, nearly destitute of vegetation, rising hundreds of feet above the surrounding plain. The entire plain region rises to an average height of from 3,000 to 4,000 ft. with large areas of level rich soil. The North Platte river, with its valley, 10 to 12 mi. in width, cuts through the heart of the high plains and is joined near the edge of the sand hills by the South Platte river entering from Colorado. The Pierre Shale region (or Bad Lands) occupies an area of about 1,000 sq.mi., chiefly in Sioux county, with minor sections in Dawes and Sheridan counties. Their weathered slopes and valleys furnish fine grazing and, with water, grow abundant crops. In connection with the Pine Ridge and Wild Cat hills this section

furnishes a region of rare scenic beauty and a sheltered range for stock.

Rivers and Drainage Basins.—All the drainage of the state reaches the Missouri river, a navigable stream which skirts the eastern border for approximately 450 mi. Chief tributaries of the Missouri in Nebraska are the Platte, with its branches; the Niobrara; the Republican; the Big and Little Blue; the Big and Little Nemaha. The Platte river is the dominant and characteristic Nebraska river. Its wide terraced valley, extending across the entire state and leading to mountain passes, made it the chief highway across the continent from the beginning. Its channel varies from one-half to one mile in width, and is filled with islands of varying size and shape. Its waters are shallow with a fall of about six to eight feet per mile. In the spring its depth varies from one to six feet. In the late summer use of water for irrigation leaves its middle course in the state entirely dry. The Loup and Elkhorn rivers, principal tributaries of the Platte, head in the sand hills and are nearly 200 mi. long each, with an abundant flow of water through beautiful valleys. Of Nebraska's 77,227 sq.mi., about 40,000 are in the drainage basin of the Platte and its tributaries. The Niobrara is a swift stream more than 400 mi. in length, running for about half that distance through canyons and hills wooded with pine and cedar. The Republican river is the principal stream along the southern border, as the Niobrara is in the north. The Big Blue and the Little Blue, about 200 mi. in length, with their tributaries, drain the south central part of the state. Their flow is more sluggish, the grade gently sloping back to the surrounding prairie. The Big and Little Nemaha, about 150 mi. long, drain the southeast section.

The lake region in Nebraska is chiefly in the sand hills, on the headwaters of the Elkhorn and Loup, making an area about 200 mi. long and 50 mi. wide. Several hundred lakes in this district furnish ideal fishing and hunting grounds. The lakes vary greatly in size and in water, from fresh spring-fed bodies to strongly alkaline.

Reservoirs resulting from the construction of numerous multiple-purpose dams augment lakes and rivers in the furnishing of recreational facilities. Artesian water exists in at least ten different counties with more than 1,500 flowing wells.

Climate.—The climate of Nebraska is inland or continental. The prevailing wind of the year is northwest, but in the spring, summer and much of the autumn, its predominance is greatly reduced by south and southwest winds from the Gulf of Mexico. Wet and dry years run in irregular cycles with no sufficient data to formulate a rule for them.

A curve covering the years from 1860 to 1950 would show dry cycles in 1860–63, 1890–95, 1910–13, 1933–36.

The normal mean annual temperature varies from 52° in the southeast to 45° in the northwest. The average temperature for January varies from 28° in the southeast to 22° in the northwest, and for July, from 78° to 68°.

The actual growing season between frosts varies from 164 days in the southeast to 122 in the northwest. The normal mean annual precipitation varies from 34 in. in the southeast to 16 in. in certain parts of the west.

Soil.—A soil of remarkable fertility is Nebraska's fundamental asset. Silt is the most common and most fertile physical element in the state soils. The top soils over most of the state are from 1 to 8 ft. in depth, a rich brownish-black vegetable humus. Below this top soil over the largest area is found the loess subsoil, varying from 10 ft. to more than 200 ft. in depth. The soil in the sand-hills regions is largely very fine sand mixed with silt. It never bakes, holds moisture and, under favourable treatment, covers itself with vegetation. Fertile valleys and slopes in the sand hills grow exceptional crops. The soils of the high plains and the butte region are chiefly a mingling of silt and fine sand, rich in lime, derived from the decomposing Arickaree strata. These soils produce splendid crops with a minimum of rainfall under modern culture methods. The Pierre Shale soils contain elements of great fertility.

Flora.—Grasses are the outstanding feature, 200 species growing within the state, a greater variety of native forage species than in any other state. Between 3,000 and 4,000 floral species have been identified within the state, including 64 trees and 77 shrubs growing native. About 1,000,000 ac. out of 49,000,000 are in forest trees.

The vast plains of the western portion of the state, when they were first entered by the white men, were covered with the short perennial grasses that gave the territory its name—"the short grass country."

History.—During approximately two and one-half centuries before 1803 when Louisiana territory, of which Nebraska was a part, was acquired by the United States, Spanish and French explorers and French fur traders occasionally entered the area that is now Nebraska.

Francisco Vásquez de Coronado, the first white man to penetrate the northern plains, probably did not reach Nebraska in his fruitless search for the mythical kingdom of Quivira during the summer of 1541, but the Coronado legend has been incorporated into the literature and pageantry of the state. In 1714, Étienne Venyard de Bourgmont, a French adventurer, ascended the Missouri river to the mouth of the Platte, referring to it as the Nebraska, or flat water. In 1720, a Spanish expedition under Col. Pedro de Villasur was massacred by the Pawnee Indians along the Platte. Peter and Paul Mallet (French) crossed the region from east to west in 1739–40.

The area was claimed by Spain, France and England, but the Spanish claim was recognized by the other two in the peace of Paris, 1763. During the period of Spanish control, fur traders (mostly French) ascended the Missouri river occasionally to trade with the Indians. A small, temporary trading post was erected in 1795 in what is now northeastern Nebraska.

In the half century following the Louisiana Purchase in 1803, exploration by Meriwether Lewis and William Clark (1804–06), Lieut. Z. M. Pike (1806), Maj. Stephen H. Long (1819–20), Col. Henry Dodge (1835), Lieut. John C. Frémont (1842–44), and Lieut. G. K. Warren (1855–57) made known to the public important facts regarding the region. Equally important were U.S. fur traders (notably Manuel Lisa and William H. Ashley) who pioneered travel on the Missouri river and through the Platte valley. Almost all of the early explorers were unfavourably impressed with the region, and their reports (Major Long's, in particular) gave rise to the belief that it was little more than a desert and entirely unfit for agriculture.

Fort Atkinson (1819–27), a military post on the present site of Fort Calhoun, was important in the fur trade and as the site of the earliest organized white activity in the area. Bellevue (1823), the oldest permanent settlement, was important in the fur trade, as a missionary centre and in the administration of Indian affairs.

Fort Kearny was established in 1846 where Nebraska City now stands, and in 1848 it was relocated on the south bank of the Platte about six miles southeast of the present city of Kearney.

The Platte valley, the state's most important topographic feature, developed into an important thoroughfare to the Rocky mountains and the Pacific coast. It was first used by Robert Stuart, returning from Astoria, in 1812–13. In 1824, William H. Ashley led a group of traders and trappers through the Platte valley to the Rocky mountains. Annually thereafter, until the decline of the fur trade in the 1840s, traders followed the Platte river route to and from the trapping grounds of the mountain region. Beginning in 1835, missionaries to the Oregon country followed the same route. In 1841, the first group of Oregon homeseekers went through the Platte valley, to be followed in succeeding years by thousands of emigrants over what came to be known as the Oregon trail. In 1847 the Mormons, led by Brigham Young, went along the north bank of the Platte en route to the valley of the Great Salt lake. They likewise were followed by many thousands in succeeding years. Gold seekers bound for California (1849–50) and Colorado (1859) added to the heavy traffic on the trail.

Concern over winning possession of the Oregon country from Great Britain, followed by agitation for a transcontinental railway, led to interest in the organization of Nebraska territory.

Treaties with the various tribes (1833–54) extinguished Indian titles to the land. The name "Nebraska," long used to designate the Platte river and surrounding territory, was suggested by Lieutenant Frémont in 1843, recommended by Secretary of War William Wilkins in 1844, and adopted by Stephen A. Douglas who introduced bills for the organization of the territory in 1844, 1848 and 1852. The final Kansas-Nebraska bill, providing for two territories, became the centre of an intense struggle in congress between the north and south, involving the extension of slavery, the removal of Indians and rival routes for the proposed Pacific railway. The bill, signed May 30, 1854, by Pres. Franklin Pierce, provided that the new territories should be slave or free as voted by citizens in each, thus reversing the policy regarding the extension of slavery established for the Louisiana territory by the Missouri Compromise of 1820. Controversy resulting from the Kansas-Nebraska act and efforts to organize the territories was an important factor in the formation of the Republican party and the split of the Democratic party, and was prominent in the series of events leading to the Civil War.

Nebraska territory, as organized in 1854, included the vast region from the 40° N. lat. to British America, and from the Missouri and White Earth rivers to the summit of the Rocky mountains. In 1861 and 1863 it was reduced by the creation of other territories to nearly its present boundaries, the only important subsequent change being the annexation in 1890 of what is now Boyd county. White settlers in the territorial period (1854–67) were chiefly in a narrow strip along the Missouri river, with isolated ranches westward along the Platte valley and the Oregon trail. The enactment by congress in 1862 of the Union Pacific Railroad act and the Free Homestead act aided white settlement, the first claim under the Free Homestead act being located in Nebraska on Jan. 1, 1863. In 1861 there were probably 30,000 inhabitants in the territory and 3,300 men from Nebraska were enlisted for the Union army in the Civil War. The great industry in this period was transport by the overland trail. Rival routes from Kansas City, St. Joseph, Leavenworth, Atchison, Nebraska City and Omaha converged at Fort Kearny on the Platte. Freight carried over these trails amounted to 200,000 tons in 1865. Over them ran the overland stagecoaches, carrying passengers, and in 1860–61, the famous "Pony Express," whose services ended with the completion of the overland telegraph in the latter year. This trail transportation business terminated in Nebraska with the construction of the Union Pacific railway in 1865–69.

The legislature first met in Omaha on Jan. 16, 1855, and annually thereafter, during the territorial period. Important early legislation related to land claims, bank charters, schools, prohibition and woman suffrage. A fight for the location of the capital between rival towns on the Missouri river, Bellevue, Brownville, Nebraska City, Plattsmouth, Omaha and Florence, resulted in Omaha's holding the capital, but in the creation of a violent feud between the North and South Platte sections which continued for many years. Speculation in townsites and lands culminated in 1857 in general distress and in the failure of all territorial banks but one, $400,000 of bank notes becoming worthless.

A proposition to form a state in 1860 was defeated at the polls. Congress passed an Enabling act on April 19, 1864, but a convention elected in that year to frame a state constitution adjourned without action. A constitution was adopted by the legislature in 1866, submitted to the voters on June 2, 1866, and carried by a majority of 100 in a total vote of 7,766. The Republicans favoured statehood in order to help the Republican majority in congress in its struggle with Pres. Andrew Johnson; the Democrats opposed it. The constitution, as adopted, limited suffrage to free white males. Congress refused to admit Nebraska until the territorial legislature passed an act pledging that Negroes would not be barred from the ballot. These terms of admission were accepted by Nebraska and carried in spite of President Johnson's veto, and Nebraska was proclaimed the 37th state on March 1, 1867.

The South Platte region had a majority in the first state legislature of 1867 and passed an act providing for the relocation of the capital in that section. Opponents of removal offered an amendment to name the capital "Lincoln," in order to make it distasteful to Democratic members from the South Platte region. The latter accepted the amendment and the capital commission on July 29, 1867, located and named the capital site at the little hamlet of Lancaster, on Salt creek.

The Democratic party was the sole political party in Nebraska from 1854 to 1858. The only political divisions were factions of that party. The Republican party was first organized in the campaign of 1858. Slavery domination of the national administration and especially Pres. James Buchanan's veto of the Free Homestead act changed territorial politics, giving the Republicans control in 1860, which was firmly held by them until 1890. In that year the Farmers' alliance organized the Peoples' Independent or Populist party. A three-cornered fight resulted in the Democrats getting the governor, and the Farmers' movement a majority of the legislature. The Populists elected a governor in 1894 and in 1896, by fusion with the Bryan Democrats and silver Republicans swept the state. The Populist party disintegrated after 1904, and thereafter political control fluctuated between the Democrats and Republicans, although some economic radicalism continued to infuse the local psychology of both parties. Significant in this regard were the career of George W. Norris in the national senate, the election as governor in 1930 and 1932 of C. W. Bryan, brother of W. J. Bryan, and the experiment in unicameral legislation begun in 1937. In 1932 and 1936 the state supported Franklin D. Roosevelt and the Democratic New Deal by overwhelming majorities, but in 1940 all the state offices, the United States senatorship and the state's electoral votes for president were carried by the Republican party. From 1940 to 1950 all offices to which men were elected on a partisan basis were filled by Republicans except in three instances in which Democratic congressmen were elected. The state's electoral votes for president in 1944 and 1948 went to the Republican party.

Government.—A constitution adopted in 1875 and revised by a constitutional convention in 1919–20 is the basis of the government. An amendment approved in 1934 substituted a unicameral legislature for the house and senate.

The general election, state and local, is in even-numbered years on the first Tuesday after the first Monday in November, but municipal and school district elections may be held at other times. In 1909 the state legislature enacted a law providing for the nonpartisan nomination of all judges, of all superintendents of public instruction and of regents of the state university.

The governor is the chief executive officer of the state, and one of the ten executive state officers chosen by direct vote of the people. The other nine executive officers are: lieutenant governor, secretary of state, auditor, treasurer, superintendent of public instruction, attorney general and three railway commissioners. The office of commissioner of public lands was abolished in 1936 by constitutional amendment. All officers are elected for two years, except the superintendent of public instruction, who is elected for four and the railway commissioners for six. The governor appoints, with legislative approval, secretaries of the code departments, members of the board of control and a few other officers. He fills vacanies in state offices arising from death, resignation or removal.

The legislature of Nebraska, beginning in 1937, consists of a single house of 43 nonpartisan legislators representing geographic areas of about equal population. The chamber is presided over by the lieutenant governor. Except at the governor's request or by a committee, no bill or joint resolution may be introduced at a regular session after its 20th day.

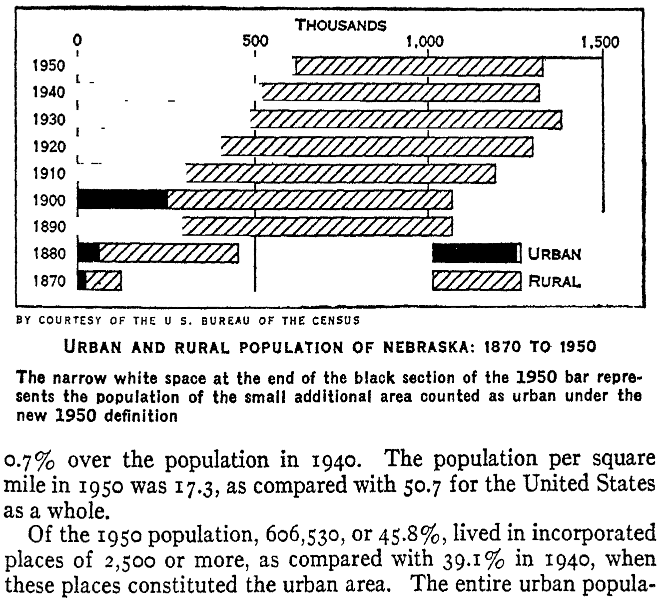
Administration of justice is vested in a supreme court, 18 district courts, county courts, municipal courts and justice courts. The supreme court consists of six associate justices, elected one from each judicial district, and one chief justice elected from the state at large, all being chosen for a six-year term. Each district court consists of from 1 to 9 judges, total number 35, elected for a term of four years. County courts have one judge, elected by the voters of the county. Only Lincoln and Omaha have municipal courts, although any city of 9,000 or more population

may establish them. There is one judge in Lincoln and in Omaha, elected by the voters of the city. There is provision for approximately 2,000 justice courts, each presided over by a justice of the peace elected by popular vote for a two-year term. The district court is the court of general, original, legal and equity jurisdiction. It is a court of record, and its jurisdiction is unlimited in amount and almost unlimited as to subject matter. Its appellate jurisdiction extends to all appeals from inferior courts. The inferior courts—county, municipal and justice—all have a limited jurisdiction, both in amount and in subject matter. The supreme court is the court of last resort. Under the constitution, appeal to this court may not be denied in any case.

Of the 93 counties, 27 are of the township or supervisor type, governed by a board of supervisors of 7 members, and 66 are of the precinct or commissioner type, governed by boards of commissioners of 3 members, except 2 which have boards of 5 members and 1 which has a board of 22 members. There were 117 incorporated cities and 400 incorporated villages in 1948. Three cities are governed by the commission plan, one by a modified commission plan, three by the city manager plan, and all others by the mayor-council form of government. Government of villages is vested in a board of trustees consisting of five members elected by popular vote. Any city with a population of 5,000 or more may adopt a home-rule charter, although only Omaha, Lincoln, and Grand Island have done so.

Other governmental subdivisions include 5 public power districts, 25 rural electrification districts and 477 other units including drainage districts, irrigation districts, reclamation districts, soil conservation districts, metropolitan utilities districts and rural fire prevention districts.

Population.—The population of Nebraska in 1860 was 28,841; in 1880 it was 452,402; in 1910, 1,192,214; in 1940, 1,315,834; and in 1950, 1,325,510. This last figure represented an increase of 0.7% over the population in 1940. The population per square mile in 1950 was 17.3, as compared with 50.7 for the United States as a whole.



BY COURTESY OF THE U S. BUREAU OF THE CENSUS

URBAN AND RURAL POPULATION OF NEBRASKA: 1870 TO 1950

The narrow white space at the end of the black section of the 1950 bar represents the population of the small additional area counted as urban under the new 1950 definition

Of the 1950 population, 606,530, or 45.8%, lived in incorporated places of 2,500 or more, as compared with 39.1% in 1940, when these places constituted the urban area. The entire urban population, under a new definition set up for 1950, which included also the thickly settled suburban area, or "urban fringe," adjacent to Omaha and Lincoln, and 1 unincorporated place of 2,500 or more outside this fringe, amounted to 621,905 or 46.9% of the state total.

TABLE I.—*Population of Nebraska and Its Principal Cities*

Area	Population			Per cent of increase	
	1950	1940	1930	1940–50	1930–40
The state	1,325,510	1,315,834	1,377,963	0.7	—4 5
Urban	621,905*	514,148	486,107	21.0	5.8
Rural	703,605*	801,686	891,856	—12 2	—10.1
Per cent urban	46.9	39.1	35.3	..	..
Principal cities					
Omaha	251,117	223,844	214,006	11.7	4.6
Lincoln	98,884	81,984	75,933	20.6	8.0

*Final figures for 1950 based on new definition. *See* comment in text.

The number of households in 1950 was 394,662, compared with 360,744 in 1940.

The average population per household declined from 3.6 in 1940 to 3.4 in 1950.

The population of the state was distributed by colour and nativity in 1950 as follows: 93.9% native white; 4.3% foreign-born white; and 1.8% nonwhite, mainly Negro. Of the foreign-born white population, 23.2% was born in Germany, 11.3% in Czechoslovakia and 9.5% in Sweden.

There were 100.9 males per 100 females in the native white population, and 111.8 in the foreign-born. Of the total population, 9.9% was 65 years old or more; and 52.9% of the population 14 years old and over was in the labour force. Of the total number of employed males, 36.5% was engaged in agriculture, 8.3% in construction, 9.4% in manufacturing, 7.9% in transportation and 16.7% in wholesale and retail trade.

Finance and Taxation.—The general property tax, established in the year 1867, is supplemented by taxes on corporations, gasoline, liquor and cigarettes, by other state licences and fees and special taxes, and by contributions from the United States treasury. The state has no general sales tax and no income tax. For the biennium 1949–51, total appropriations for state government were $152,441,582, including $78,019,590 federal aid. In 1949, state revenues amounted to $46,090,000, and were derived as follows: property tax, 29.6%; motor vehicle fuels and fees, 42.9%; alcohol and tobacco taxes, 14.2%; miscellaneous, 13.3%.

As of June 30, 1948, there were 283 state banks operating in Nebraska, with total resources of $389,682,165; total liabilities of $367,940,632; and total capital accounts of $21,741,533. There were 127 national banks with total resources of $912,954,000; total liabilities of $863,698,000; and total capital accounts of $49,256,000.

Education.—The United States endowment of public education embraced 2,802,756 ac. of land for common schools, 89,140 ac. for the college of agriculture, 45,439 ac. for the University of Nebraska. The endowment of common schools in 1950 included 1,626,230 ac. of land and $12,873,753 in proceeds of former land sales invested in securities; for the university and agricultural college, 10,822 ac. and $1,018,572 invested in securities. In addition, the state endowed Nebraska State Teachers college at Peru with 12,804 ac. of state land. The annual income from these school endowments is about $1,000,000.

In the common-school system in 1949 there were 7,135 schoolhouses with an enrolment of 225,516 and 11,817 teachers. The total investment in school property was $99,598,126 and the annual expenditure $40,437,775.

Four state teachers colleges had a total attendance in 1949–50 of 4,676 students and 245 faculty members; one was at Peru (opened 1867), one at Kearney (1905), one at Wayne (originally private, purchased by the state in 1909) and one at Chadron (established 1911). The University of Nebraska at Lincoln was established in 1869 by an act of the state legislature and was opened in 1871. Connected with it and governed by the same regents are the school of agriculture at Curtis and the agricultural experiment stations at North Platte, Valentine and Alliance. The university in 1950 consisted of ten colleges and three schools, as follows: colleges of agriculture, arts and sciences, business administration, dentistry, engineering, graduate, law, medicine (at Omaha), pharmacy and teachers; and schools of fine arts, journalism and nursing. The total enrolment for the school year 1949–50 was 8,500 students and there were about 700 faculty members. Nearly all educational institutions in the state are coeducational. In 1929 the legislature authorized the establishment of the Municipal University of Omaha. There are junior colleges at Fairbury, McCook, Norfolk and Scottsbluff. Among the private educational institutions are: Nebraska Wesleyan university and Union college at Lincoln; Creighton university, Duchesne college and College of St. Mary at Omaha; Concordia Teachers college at Seward; Dana college at Blair; Doane college at Crete; Hastings college at Hastings; Luther college at Wahoo; Midland

college at Fremont; Nebraska Central college at Central City; and York college at York.

The state board of control and the department of public welfare exercise a general supervision over charitable and penal institutions. The state institutions maintained in 1950 under direction of the board of control included: an institution for feeble-minded, Beatrice; a girls' training school, Geneva; a soldiers' and sailors' home, Grand Island; Hastings State hospital, Hastings; a boys' training school, Kearney; a hospital for tuberculosis, Kearney; Lincoln State hospital, Lincoln; an orthopaedic hospital, Lincoln; a state penitentiary, Lincoln; Nebraska Industrial home, Milford; a school for the blind, Nebraska City; Norfolk State hospital, Norfolk; a school for the deaf, Omaha; a reformatory for women, York; Nebraska Psychiatric unit, Omaha; a home for dependent children, Lincoln; a reformatory for men, Lincoln. These institutions in 1949 had 8,217 inmates and 2,274 employees. The appropriations for board of control institutions for the biennium 1949–51 totalled $8,837,910.

Agriculture and Livestock.—Of a total of 49,057,920 ac. there were, in 1944, 19,596,000 ac. from which crops were harvested, 1,251,000 ac. lying fallow and 23,505,000 ac. used for range and pasture. The total value of crops produced in 1949, exclusive of sugar beets, was $6,519,625,000 compared with a total value, exclusive of fruit, of $142,133,000 in 1940. The total number of farms decreased from 133,616 in 1935 to 111,756 in 1945. The value of farmland and buildings increased from $1,562,813,000 in 1935 to $1,699,210,000 in 1945. The average acreage per farm in 1945 was 427, as compared with 341 in 1935. Of the total number of farms, in 1945, 58,225 were operated by owners or part owners; 432 by managers; and 53,099 by tenants. The percentage of farms operated by tenants in 1945 was 47.5%.

TABLE II.—*Nebraska Field Crops, 1949*

Corn	7,364,000 ac.	239,330,000 bu.	$275,230,000
Wheat	3,761,000 "	54,408,000 "	103,502,000
Oats	2,260,000 "	49,720,000 "	29,832,000
Hay	4,341,000 "	4,786,000 tons	76,576,000
Barley	307,000 "	5,833,000 bu.	5,250,000
Sorghums (grain)	65,000 "	1,592,000 "	1,385,000
Sorghums (forage)	272,000 "	408,000 tons	3,060,000
Rye	189,000 "	1,606,000 bu.	1,847,000
Soybeans	22,000 "	484,000 "	1,016,000
Potatoes	52,000 "	8,840,000 "	11,492,000
Sugar beets	38,000 "	559,000 tons	.
Beans, dry	82,000 "	60,000 "	6,696,000
Alfalfa seed	100,000 "	120,000 "	2,892,000

The value of livestock in Nebraska in 1945 was $375,216,000, compared with $160,396,000 in 1940. The number and value of domestic animals in the state on Jan. 1, 1950, were: 236,000 horses valued at $7,788,000; 9,000 mules valued at $423,000; 3,920,000 cattle valued at $486,080,000; 2,475,000 swine valued at $79,200,000; 588,000 sheep valued at $10,349,000; 14,307,000 chickens valued at $17,168,000.

During the period 1902–50, the steady progress of irrigation and water-power enterprises made possible a tremendous growth of agriculture in Nebraska, and particularly in the central and western portions of the state. Irrigation in western Nebraska developed rapidly following the drought of 1890, and particularly following the passage of the federal Reclamation act of 1902. Principal streams furnishing water for irrigation are the Platte, Loup, Niobrara, Republican and Elkhorn rivers. In 1944 there were 631,762 ac. irrigated in the state. Construction authorized under the Missouri River development program in 1944 would add 989,445 ac. of irrigated land.

Industries, Mining and Transportation.—Manufacturing grew chiefly in the conversion of raw products of agriculture into commodities for market. The United States census of manufactures for 1947 indicated that added value resulting from manufacturing in Nebraska amounted to $260,500,000. Food and kindred products accounted for 60%; printing and publishing, 4%; machinery, except electrical, 4%; electrical machinery, 4%; miscellaneous groups, each less than 4%, 20%.

On Nov. 1, 1939, oil was discovered in Richardson county. By 1950, 130 producing wells had been drilled, and a total of 5,842,000 bbl. of petroleum had been produced in the county. In July 1949 oil was discovered in Cheyenne county. By Oct. 1950 50 wells in the county were producing 2,600 bbl. daily, and six gas wells had been reported.

Missouri river navigation was a leading method of transportation until the construction of the railways in the 1870s. As a result of railway competition it declined to almost nothing, but in the 1940s, as the result of an extensive channel-improvement program carried out on the river, increased in tonnage, if not in relative importance, to a more extensive trade than during the earlier period. Railway mileage amounted to 5,820 mi. in 1947, as compared with 6,174 mi. in 1930. Ten trunk railways radiate from Omaha, five of them with a network of feeders over the state. The Union Pacific was the first railway, beginning construction on July 13, 1865, at Omaha. There were, in 1949, 137 airports in the state, of which 103 were for owners of smaller type aircraft; 18 were for feeder transport aircraft; and 16 were for the largest type of transport aircraft.

The most important transportation development in Nebraska in the years 1920–50 was the great extension of improved highways. An era of road building and road maintenance began in 1917 which was greatly promoted by the rapid increase of motor vehicles. In 1947 a total of 529,930 motor vehicles were registered, including 369,846 passenger cars; 47,230 commercial trucks; 46,201 farm trucks; 299 buses. There were, in 1948, 100,666 mi. of rural roads, of which 9,220 mi. were marked and maintained state highways. Of these, 4,060 mi. were paved. From 1926 to 1948 total highway expenditures were $224,653,062.

NEBRASKA CITY, a city of southeastern Nebraska, U.S., on the high bank of the Missouri river, 40 mi. below Omaha; the county seat of Otoe county. It is on federal highways 73 and 75, and is served by the Burlington Route and the Missouri Pacific railway systems. Pop. (1950) 6,851; (1940) 7,339. It is the seat of the state Institute for the Blind, and the trading and shipping point for a fine agricultural region; industries include food products, feed and brick. "Arbor Lodge" (formerly the home of J. Sterling Morton, a member of Grover Cleveland's cabinet and the originator of Arbor day) with its fine arboretum, is now a state park. Nebraska City is one of the oldest settlements in the state, and for several years at the height of the migration westward was the largest city. A fort was established on the site in 1847, but was abandoned the following year for a location farther west. In 1858 several settlements in the vicinity were consolidated and incorporated as Nebraska City, and it was made the headquarters of a freighting firm which distributed supplies to the army post between the Missouri and the Rockies (2,782,258 lb. in seven months in 1859).

NEBUCHADREZZAR or NEBUCHADNEZZAR, king of Babylon, the Ναβουκοδρόσορος of the Greeks. The first and last are nearer to the original name as it is found in the cuneiform monuments, viz., Nabu-kudurri-usur, "Nebo, defend the land-

mark." Nebuchadrezzar seems to have been of Chaldean origin. He married Amuhia, daughter of the Median king, according to Abydenus, and in 605 B.C. defeated Necho at Carchemish, driving the Egyptians out of Asia and annexing Syria to the Babylonian empire. In the following year he succeeded his father Nabopolassar on the Babylonian throne, and continued the restoration of Babylon, which he made one of the wonders of the world. His "new palace" there was built in fifteen days; temples were erected to the gods, the great walls of the city were constructed with a moat surrounding them, the Euphrates was lined with brick and a strong fortress erected. Canals were dug throughout the country and a great reservoir excavated near the capital. Only a fragment of his annals has been preserved, recording his campaign against Amasis (Ahmosi) of Egypt in his thirty-seventh year (567 B.C.) when he defeated the soldiers of "Phut of the Ionians." Tyre revolted in the seventh year of his reign, and was besieged for 13 years; a contract-tablet dated in his fortieth year shows that at that time it was under Babylonian officials.

After the investment of Tyre Nebuchadrezzar marched against Jerusalem, put Jehoiakim to death and placed Jehoiachin on the throne. Three months later Jehoiachin was deposed and Zedekiah made king in his place. Zedekiah's revolt in 588 B.C. led to another siege of Jerusalem, which was taken and destroyed in 586 B.C. (*See* JEWS and JERUSALEM.) From his inscriptions we gather that Nebuchadrezzar was a man of peculiarly religious character.

See Josephus, *Cont. Apion*, i, 19; Eusebius, *Praep. Evangel.* x.

NEBULA, in astronomy, the name given to certain luminous, apparently nonstellar patches in the sky. (Latin for mist, Greek νεφέλη.) Dark nebulae are also known. The smaller luminous nebulae resemble distant comets when seen in a telescope of moderate power but can be easily distinguished from them, because comets, being within the confines of the solar system, appear to move among the stars, while the nebulae, being at stellar distances, have no such motion. With the exception of the two Magellanic Clouds in the southern hemisphere, and the two spirals in Andromeda and Triangulum, nebulae are invisible to the unaided eye, and the combined aid of a very large telescope and the photographic plate are required for the adequate study of these faint objects. The two largest and brightest in the northern hemisphere, and the best examples of the two fundamentally different types of nebulae, are the spiral nebula in Andromeda and the diffuse nebula in Orion.

The nebulae are very numerous, those in the Galaxy being counted in the hundreds, those beyond the Milky Way being reckoned up to 100,000,000, with this number limited only by the penetrating power of the largest telescope in operation, the 100-in. reflector on Mount Wilson. Comparatively few of these millions show much structure even on photographs taken with the most powerful instruments. Since the nebulae exhibit luminous *surfaces,* as opposed to the *point-images* of stars, even the largest telescope, though it makes nebulae appear larger, does not make them any brighter than they are to the unaided eye (*see* PHOTOGRAPHY, CELESTIAL). But the photographic plate has the advantage over the human eye of being able to accumulate the effect of exposure to a faint source of light, and thus by means of long exposures, sometimes extending over many hours or even several nights, it is possible to photograph nebular detail far too faint to be observed visually in any telescope.

Historical.—*Earliest Records.* Historical records of luminous patches in the sky are known to go back to Hipparchus (*ca.* 190–125 B.C.), who included in the earliest known star catalogue entries for the double star cluster in Perseus (h and χ Persei) and for the "Beehive" star cluster in Cancer (Praesepe). Nearly 300 years later Ptolemy (*ca.* 138 A.D.) listed five "cloudy stars" in his *Almagest,* but these objects, apparently nebulous to the eye, are in reality star clusters. The earliest known record of a nebula, as distinguished from a star cluster, is the one for the Andromeda nebula given by Al Sûfi (903–986) in his *Book of the Fixed Stars,* epoch 964. The spiral in Andromeda thus shares with the Magellanic Clouds the distinction of being one of the three nebulae discovered before the invention of the telescope. The Clouds of Magellan, which become visible to travellers to the southern hemisphere soon after the Torrid zone is entered, were known to the Portuguese navigators of the 15th century, and although not discovered by Magellan, the clouds are by common consent associated with his name to honour the great circumnavigator. Soon after the first use of the telescope on celestial objects in 1609 by Galileo (1564–1642), the Orion nebula was discovered in 1610 by the famous French patron of science Nicholas Peiresc (1580–1637). The Jesuit priest Cysatus (1588–1657) who began to survey the sky with a telescope in 1611 and who was the first to make a telescopic observation of a comet in 1618, also discovered the same nebula. It was Christiaan Huygens (1629–1695), however, who not knowing of the earlier discoveries by Peiresc and Cysatus, gave in 1656 the first description and sketch of the brightest part of the Orion nebula around the central star of Orion's sword (θ Orionis). In the case of the Andromeda nebula, it too was soon rediscovered after the invention of the telescope, in 1611 by Simon Marius (1570–1624) who described it in the oft-quoted poetical words, "Like a candle seen at night through a horn."

Early Catalogues.—The first attempt to catalogue nebulae seems to have been made in 1715 by Edmund Halley (1656–1742), after whom is named the famous comet that returns to view every 75 years in accordance with his prediction. Halley listed six "luminous spots or patches," among them the globular star cluster in Hercules—the brightest one in the northern hemisphere—which he discovered in 1714. The next list, in this case of 16 "nebulous stars," was given in 1733 by the English divine W. Derham (1657–1735), apparently as a result of some observations he made in 1732, with a reflecting telescope, of such objects included in an earlier (1690) work by J. Hevelius (1611–1687), who has sometimes been called the founder of the scientific study of the moon's surface (selenography). In the first extensive survey of the southern skies made at the Cape of Good Hope in the years 1751–54 by Nicolas Louis de Lacaille (1713–1762), a total of 42 nebulae were observed and then described in another significant list of such objects published in 1755. Shortly thereafter, another Frenchman, Charles Messier (1730–1817), while following the comet of 1758, noticed a nebulous object near the third-magnitude star ζ Tauri. His discovery, later to be called the "Crab" nebula in Taurus, is now known to be the expanding gaseous remnant of the 1054 *supernova* (*see* NOVA) which was observed in China and in Japan, and which represents one of nature's greatest cataclysms, compared with which an atomic bomb explosion is less than a match flame. Messier, although much more interested in comets—Louis XV nicknamed him the "ferret of comets"—found that his searches could be more efficiently prosecuted if he noted the positions of those apparently cometary objects which did not move among the stars. In this way Messier discovered most of the brighter nebulae and clusters visible from northern latitudes, and his final catalogue published in 1781 contained 103 entries.

The Catalogues of William and John Herschel.—The foregoing early catalogues of nebulae almost pale into insignificance, however, when compared with the systematic sweeps of the skies made by William Herschel (1738–1822) and his son John Herschel (1792–1871). With a reflector of his own making, the elder Herschel began his illustrious career as the founder of sidereal astronomy by observing the Orion nebula in 1774. Its appearance so amazed him that he directed his attention to other nebulae, which then became objects for his life-long study and interpretation. Between 1786 and 1802 he discovered and catalogued, in three lists, more than 2,500 nebulae. The younger Herschel, in one of the most striking instances of inherited talent, proved to be his father's ablest successor in the field of nebular observation and discovery. Like his father, he constructed in 1820 his own telescope, an 18-in. speculum metal reflector, and began in 1825 to reobserve many of the nebulae found by his parent. The outcome of this second survey was a catalogue of 2,300 nebulae, of which 525 were new. John Herschel found the field so fascinating that he resolved to extend his search to southern skies, and in 1834 he began on Table mountain near Capetown, South Africa, a four-year survey that marked a new era in the study of celestial

objects visible in the southern hemisphere. The Magellanic Clouds were for the first time subjected to a detailed examination, with the result that the larger one was found to contain more than 900 member star clusters, nebulae and stars associated with nebulosity, while nearly 250 similar objects were counted in the smaller cloud. In addition to these discoveries, admittedly incomplete, the younger Herschel catalogued more than 1,700 other nebulae in southern skies, and for a number of them he made beautiful drawings. Upon his return to England in 1838, he set about systematizing all his own and his father's discoveries of nebulae, and his labours culminated in the "General Catalogue" of some 5,000 entries published in 1864 in the *Philosophical Transactions* of the Royal society. This great work forms the backbone of J. L. E. Dreyer's *New General Catalogue of Nebulae* (N.G.C.) (1888), which augmented by the *First* (1895) and *Second* (1908) *Index Catalogues* (I.C.), with a combined total of more than 13,000 entries, constitutes the standard reference list for nearly all modern observations of nebulae.

Development of Nebular Photography.—With the invention of photography and its application in astronomy, the observation and study of nebulae received an impetus of revolutionary proportions. The first to utilize the technique in this field was a New England physician, Henry Draper (1837–82), who on Sept. 30, 1880 took the first photograph of a nebula, that in Orion. As is usual when a new and powerful means of investigation becomes available, progress is at first very rapid, and widely-separated workers independently and almost simultaneously make the same advances. Thus, while the priority is Draper's, his photography of the Orion nebula quickly found its counterparts in France in 1881 by P. J. Janssen (1824–1907), and in England in 1883 by A. A. Common (1841–1903) and in 1886 by Isaac Roberts (1829–1904), the latter two being pioneers in the use of silver-on-glass reflectors, of apertures of 36 in. and 20 in., respectively. From about 1885 on, nebular photography increased at an accelerated rate, so that only a few of the more important milestones may be mentioned here. The nebulosity around the Pleiades was first recorded photographically by the Henry brothers, Paul and Prosper, in Paris in 1885, though it had been seen visually by W. Tempel in 1859. The faintness of this filmy veil places it near the limit of vision, and even the early photographs showed only the brightest parts around the stars Merope and Maia. The full extent of the nebulosity began to be revealed by an exposure made by Isaac Roberts at Maghull, Lancaster county, England, in 1886, and by later photographs taken in 1888 by the Henrys, but it was not until E. E. Barnard began at the Lick observatory in 1889 to use wide-angle portrait-lens cameras that the Pleiades, and many other Milky Way regions, were shown to be enmeshed in wispy clouds of great complexity and considerable extent. Barnard likewise pioneered in the systematic discovery and listing of the dark nebulae (*see* section below on *Dark Diffuse Nebulae*), and his work did much to direct attention to them as clouds of interstellar dust, with the ultimate result, established by a great deal of modern work, that the astronomical scale of distances for far-away stars needed to be corrected for the dimming of light by obscuring matter concentrated in the galactic plane. Barnard's methods of nebular photography were quickly and widely adopted, notably by H. C. Russell at Sydney in 1890, whose work on the southern Milky Way and on nebulae complemented Barnard's in the north, and by Max Wolf at Heidelberg in 1891, who pioneered in the photographic charting of the small nebulae outside the Galaxy.

Quite a different but highly significant advance in nebular photography was made by J. E. Keeler at the Lick observatory in 1899. Working with a 36-in. reflector donated in 1895 by Edward Crossley, of Halifax, England, Keeler firmly established the advantages, previously suggested by Isaac Roberts' work, of this type of instrument for the detailed investigation of the spiral nebulae. Before the advent of photography, Lord Rosse (1800–67) and his associates at Parsonstown, York, had been able with large speculum metal mirrors (up to six ft. in diameter) to discover visually during the years 1845–50, spiral structure in 14 nebulae, and to resolve into stars a number of hitherto nebulous objects. Keeler's contribution—in a sense a photographic sequel to Rosse's work—was to show that spiral structure was a very common characteristic of nebulae distant from the Galaxy, and that the number of spiral nebulae was at least ten times greater than had formerly been supposed. His conservative estimate made in 1900 placed the number within reach of the Crossley reflector at 120,000 and later work with the same equipment, first by C. D. Perrine, in 1901–03, and then by H. D. Curtis in 1909–19, brought this figure to nearly 1,000,000 nongalactic nebulae.

The manifold possibilities for extensive survey work on nebulae with wide-angle lenses, as exemplified by the pioneer observations of Barnard and Wolf, were soon appreciated by many other astronomers, but perhaps the fullest exploitation of such technique is represented by the modern work in this field initiated by the Harvard college observatory. Beginning approximately in 1900 in the southern hemisphere, originally at Arequipa, Peru, and after 1927 at Bloemfontein, South Africa, Harvard astronomers have used the largest star-camera—the Bruce 24-in. photographic refractor—to investigate nebulae over large areas of the southern skies, while in the north, at Oak Ridge, Mass., the 16-in. Metcalf refractor has been used for similar work. Started about 1930 under the direction of Harlow Shapley, the Harvard surveys of galaxies to nearly the 18th magnitude have recorded many thousands of nebulae, and the program envisions an ultimate census of more than 500,000 objects.

Probably the greatest advances in our knowledge of nebulae have come from the use of reflectors of steadily increasing size. Following Keeler's demonstration that a 36-in. reflector is a powerful means for the study of individual nebulae, G. W. Ritchey at the Mount Wilson observatory constructed and used (1908–17) a 60-in. reflector for the photography of nebulae under the most favourable conditions. Ritchey's pictures, for years unsurpassed in quality, set a new standard in definition, with the result that a number of spirals were partially resolved into stars. This was an achievement of tremendous import, for it pointed the way toward the comparative study of stars in the nebulae with those in the Galaxy, thus leading to a solution of the long-standing problem of the distances of spirals. The promise of still greater advances was foreseen by G. E. Hale, and under his inspiration a 100-in. reflector was installed on Mount Wilson in 1917. With this instrument—the largest in operation in 1946—Edwin Hubble began in 1923 a comprehensive series of researches of nebulae which led to the first firm scale of extragalactic distance and to its extension to distances of the order of hundreds of millions of light-years (1 light-year = 6,000,000,000,000 mi.). With these distances, together with certain spectroscopic observations of his colleague, M. L. Humason, and with those of V. M. Slipher at the Lowell observatory, Hubble in 1929 announced one of the most outstanding results of modern astronomy: the more distant a nebula is, the faster it seems to be receding from the earth. Moreover, the speeds of recession, as indicated by the increased wave lengths of spectrum lines (called "red-shifts") in the light from nebulae, became enormous at great distances, the highest speed measured corresponding to about 25,000 mi. per second, or nearly 1/7 the velocity of light. With astronomy in this manner thrusting into cosmology, by providing the observational basis for W. de Sitter's, A. Einstein's and G. E. Lemaitre's mathematical theories of the "Expanding Universe," Hale in 1928 again realized the possibilities offered by increased aperture, and he was able to initiate construction at the California Institute of Technology, Pasadena, of a 200-in. reflector to be placed on Mount Palomar. Completion of this greatest of telescopes was interrupted by World War II, but by 1946 there was good reason to expect that a few years more work would place it in operation.

Classification of Nebulae.—The nebulae fall naturally into two groups which are designated the *galactic* and the *extragalactic.* Alternate names for the latter group—by far the largest—are *nongalactic, anagalactic,* or merely *galaxies.* Galactic nebulae are found in or near the plane of the Milky Way (the Galaxy), while extragalactic nebulae or galaxies are seen, for the most part, outside the Milky Way. The division is not merely one of apparent distribution over the sky, for the two classes of objects differ fundamentally in every important respect, such as distance, in-

trinsic size and brightness and constitution. In fact, the two categories are so dissimilar that they should logically be separately discussed.

THE GALACTIC NEBULAE

These are of two types: (1) *Diffuse Nebulae* and (2) *Planetary Nebulae.* The first kind includes *bright* and *dark* nebulae, but with no clear-cut division, since the two are often found thoroughly mixed together. The second kind is a relatively unique group of objects, usually of round or of symmetrical structure, and nearly always having a single star near the centre of the sharply-defined outer edges of the nebula.

Diffuse Nebulae.—Modern work on interstellar dust clouds suggests that diffuse nebulae may be regarded from the following very general point of view. Throughout our own stellar system, of which the fundamental plane is the Milky Way, there is a thin layer of nonluminous matter. This material, a mixture of atoms, molecules, dust particles and larger masses, is not uniformly distributed, but is relatively concentrated in some regions, and extremely tenuous or absent in others. In some cases denser clouds are situated in front of a bright, starry background. They are then revealed in silhouette, and photographs such as Barnard's record them as *dark* nebulae. On the other hand, it often happens that single stars, or groups of stars, lie in the denser parts of the stratum. In this case the stars illuminate the surrounding cloud, much like street lights in a fog, and *bright* nebulae may be seen or photographed by the light scattered by the particles composing the cloud. *Mixed bright and dark* nebulae occur in circumstances where a cloud is so large that the light from the involved stars does not penetrate to its boundaries, so that a bright nebula appears to be superposed on a larger dark one; or again, the obscuring matter may be localized in streaks or lanes, which are outlined or contrasted against the brighter and less opaque parts of the cloud.

Bright Diffuse Nebulae.—The true character of these objects became known in 1864–68 when William Huggins (1824–1910) examined several of them with his spectroscope and found their light highly concentrated into a few bright radiations, typical of a rarefied gas excited to luminescence. So many more were subsequently found to have a similar spectrum that for nearly half a century it was generally supposed all diffuse nebulae were incandescent gases. In 1912, however, V. M. Slipher of the Lowell observatory announced that the spectrum of the nebulosity around the Pleiades gave an absorption spectrum, which is a continuous, coloured band of light crossed by dark lines. Furthermore, the nebular spectrum was like that of the stars imbedded in the nebula. These results, which were later obtained for a number of other diffuse nebulae, provided evidence for the view that some nebulae shine by *scattered* or *reflected* light directly received from the stars, rather than by *emitted* light indirectly excited in the nebula by ultra-violet radiation from the stars. The latter mechanism was satisfactorily described by I. S. Bowen in 1927, and is of such great astrophysical importance that it is considered in some detail in the section below entitled, *The Gaseous Spectrum of Nebulae.* Before Bowen explained the origin of the nebular emission spectrum, however, Hubble in a systematic and complete investigation of diffuse nebulae published in 1922 discovered two significant properties of these objects: (1) whether a diffuse nebula shines by emitted light (bright-line spectrum) or by reflected or scattered light (absorption spectrum) depends upon the temperature of the star or stars concerned. Although there is some overlapping, in general it is found that stars hotter than about 20,000° C. (spectral type B1 or earlier) can excite an emission spectrum in the nebula, while cooler stars merely illuminate the nebula by reflection and scattering. (2) The luminous area of the nebula extends outward to a distance proportional to the square root of the brightness of the star.

It is possible to determine with considerable accuracy the velocities in the line of sight (*radial* velocities) of those nebulae which show an emission spectrum, because their light though faint is concentrated in a few bright spectral lines. Observations made at the Lick observatory by W. W. Campbell and J. H. Moore, and published in 1918, show that the average motion is some 6 to 7 mi. per second, which is relatively slow by stellar standards. The determination of velocities across the line of sight (*transverse* velocities), on the other hand, is difficult for two reasons: (1) there is a general absence in diffuse nebulae of sharply-defined points suitable for accurate measurement; (2) the diffuse nebulae are so distant, and their internal motions so slow, that no displacements large enough to measure are shown during the relatively few years that have elapsed since the nebulae were first photographed.

Variable Diffuse Nebulae.—This is a comparatively rare class of objects comprising less than a dozen known members. They are usually fan-shaped, bowed or arched, with a star of irregularly variable light located at or near the point of the fan or centre of the arches. Without exception, they are found in dark lanes of the Milky Way. Only a few of them have been studied, with somewhat inconclusive results. Photographs of J. R. Hind's and Hubble's variable nebulae (N.G.C. 1555 and 2261, respectively), show marked changes in intensity in different parts of the objects, but there is little evidence that the parts have moved. Moreover, no close correspondence between light variation in the stars and nebulae has been established. The few spectra that have been obtained of these nebulae, by Slipher and by Hubble, show their light to be continuous. The spectra of the involved stars, known as T Tauri variables, have been studied by A. H. Joy at Mount Wilson, who reported in 1945 that their light consists of a bright-line spectrum of varying intensity superposed on an absorption spectrum characteristic of dwarf stars like the sun (temperature 6,000° C.). This latter fact, in view of Hubble's relation mentioned above, is consistent with the fragmentary observations of continuous spectra in the nebulae. Although it is clear that much remains to be done before the puzzle of variable nebulae is solved, H. D. Curtis has pointed out that the lack of correlation between stellar and nebular fluctuations in brightness argues against the explanation of light pulses, or bursts from the associated star, producing an unsteady illumination of the nebula. A more plausible hypothesis would be the interruption or dimming of the nebular light by clouds drifting between the star and nebula, and, under certain circumstances, the interposed, passing material could produce shadow effects on the nebula.

Dark Diffuse Nebulae.—There are in the Milky Way a great number of dark patches, some of them almost entirely devoid of stars. A few of these were discovered by the Herschels, who thought them to be holes through which they looked into empty space beyond. Barnard, who catalogued several hundred of them, and whose studies of these dark nebulae finally showed that they were caused by the presence of clouds of nonluminous matter, was at first loath to believe they were other than holes or spaces actually containing no stars. They vary in size from small patches only a minute of arc in diameter to the large lanes in Ophiuchus and Scorpius. Even the huge rift 120° long which divides the Milky Way from Cygnus to Centaurus must be considered to be of a similar nature. An analogous bifurcation is frequently found in spiral nebulae seen edge-on, and comparative studies of them with the Galaxy, carried out by H. D. Curtis, did much to establish the current conception of our own stellar system as one of the giant spiral nebulae.

Although it might be supposed that less could be learned of dark nebulae than of bright ones, because the invaluable spectroscope cannot be directly applied to their investigation, some powerful statistical methods have been devised which lead to the distances of dark nebulae, and to estimates of their absorptive power. At first, distances of these objects were obtained from parallax measurements of the associated stars, but in only a very few instances are the stars close enough to give reliable determinations. A more generally applicable method, first devised by Max Wolf, and later refined and placed on a precise statistical basis by A. Pannekoek of Amsterdam, is one involving star counts in and around a dark nebula. By making counts of stars in two areas of the same size, one in the nebula and the other in a nearby unobscured area, it is found that at first, for the brighter stars, the counts run about the same, but, as the fainter stars are

reached, the numbers in the dark area fall below those outside. The apparent magnitude at which the deficiency becomes noticeable indicates the distance, since as the result of much modern work on stellar statistics, the average distance is known for stars of a given magnitude. Furthermore, the absorptive power is obtained from the percentage deficiency observed for the faintest stars counted. In this way it has been determined that most of the prominent dark nebulae range in distance from a few hundred to a few thousand light-years, which is relatively close on the galactic scale, and that they absorb 30% to 95% of the light.

Considerable information has been obtained about the nature of the obscuring matter in dark nebulae from theoretical investigations of the absorbing and scattering power of finely-divided matter, and from observations of the colours and spectra of the involved stars. In 1901, H. von Seeliger of Münich, as a result of his investigations of the swarm of meteoric bodies composing Saturn's rings, was led to a theoretical consideration of the effects of starlight reflected by small bodies. His work, however, found no immediate application to dark nebulae because it was done so long before Slipher's spectroscopic discovery in 1912 of reflection nebulae in the Pleiades. Ten years after Slipher's significant observations were made, H. N. Russell of Princeton investigated the theory that dark nebulae are composed of extremely fine dust particles. He derived formulae relating the total absorption in such clouds to density and size of the particles, and concluded that the most efficient dimming occurs for particle diameters about $\frac{1}{3}$ the wave length of light, or for sizes of the order of 1/150,000 in. These calculations were very revealing, since they showed that absorptions of several magnitudes could be produced by extensive clouds of matter without the total mass becoming unreasonably large. At approximately the same time as Russell's theoretical work, F. H. Seares and Hubble at Mount Wilson had found numerous cases of reddened stars imbedded in nebulosity. Thus by 1922 it was evident that dark clouds not only dimmed starlight, but that they also absorbed relatively more blue light than red, and this fact constituted additional evidence for the very small size of the material concerned. Russell's absorption theory was extended by Carl Schalén of Upsala, Sweden, who also applied it more powerfully by utilizing the colours and spectra of stars involved in dark nebulae. He found the percentage of reddening to be small, and from the apparently reasonable assumption that the particles are metallic compounds of iron, zinc and copper, concluded that the most effective dimming occurs for a size of 1/300,000 in. Seeliger's reflection theory has also been more fully developed and applied, notably at the Yerkes and McDonald observatories by Otto Struve and his associates L. G. Henyey and J. L. Greenstein. For dust particles large enough to produce more reflection than scattering, Henyey in 1937 developed a theory which allows a determination of the orientation and distance of a reflection nebula from the illuminating star. Application of this theory to some reflection nebulae has indicated separations of several light-years between star and nebula.

If it is true that the process of scattering is more effective than those of absorption or reflection, then a dark nebula might be faintly visible in scattered light. To test this possibility, Struve and C. T. Elvey in 1935 compared the surface brightnesses of dark nebulae with areas between stars in unobscured regions, and from the slight differences detected they concluded that either the reflection was small or the scattering large. The latter explanation was then proved to be the correct one by Elvey and F. E. Roach in 1937 from extensive measures (with the aid of a photoelectric cell) of the radiation from the Milky Way. They found that, after allowing for all the light contributed by the stars, there still remained a considerable amount (50%) which could only have come from scattering by small particles between the stars. Then in 1938, in a notable achievement of spectroscopic observation, Struve and Elvey reported photographs of the spectrum of this extremely faint light, and established the existence of large clouds of dimly-glowing hydrogen and oxygen throughout many regions of the Milky Way. Finally in 1938, in a detailed study of the efficiency of scattering by dust particles, Henyey and Greenstein concluded that the obscuring matter probably does not consist mainly of metallic specks, but that other unknown constituents, perhaps rocklike compounds, are responsible for the appearance of dark nebulae.

Planetary Nebulae.—These are so named because their appearance in a telescope resembles that of planets; *i.e.*, they show fairly well-defined disks having definite edges. But that is the only feature which planets and these nebulae have in common, for the planetary nebulae, being distant members of the stellar system, show no appreciable motion among the stars. In general they are much farther away than the diffuse nebulae, are smaller and have a bright-line spectrum which ordinarily readily distinguishes them from other galactic nebulae.

Numbers and Distribution.—The planetaries form a rather small and unique group which until about 1940 was presumed to include nearly 130 members, but from photographs taken on Mount Wilson with a specially-designed prismatic camera, R. Minkowski by 1945 had increased the total number known to nearly 200. Since practically all these new additions are indistinguishable from stars even on photographs taken with large reflectors, it thus appears that many more remain to be discovered among the fainter stars of the Galaxy.

Like the diffuse nebulae, the planetaries tend to be distributed within the Milky Way, but in much less degree. In galactic concentration they are intermediate between diffuse nebulae and the globular star clusters, and like the latter, the planetaries are most numerous in Sagittarius and Scorpius, which is the direction to the centre of the galactic system.

Size and Structure.—In apparent size the planetary nebulae average less than one minute of arc in diameter, and they range from nonuniform surfaces half the diameter of the moon, down to pointlike stellar images identifiable as planetaries only from their spectra. With few apparent exceptions, and probably with no real exceptions, planetary nebulae have bluish-white central stars whose brightnesses range from the 9th to the 19th magnitude. These central stars are among the hottest objects known, with temperatures in some cases estimated as high as 150,000° C. The high frequency of round or elliptical outlines exhibited by the planetaries means that these nebulae probably are spherical or ellipsoidal in form, and in those numerous cases which show a beautiful arrangement of ring within ring, the true structure may actually be a series of concentric shells.

Distances and Densities.—Unfortunately, the distances of the planetary nebulae are not known with any high accuracy. They are so far away that direct trigonometric methods are untrustworthy, and their transverse motions are so small that they are hardly measurable during the relatively short time that has passed since suitable photographs were first obtained. The most that may be said about distances of the planetaries is that they are large, and that they are uncertainly estimated to range from 3,000 to 30,000 light-years. With these distances, the typical bright planetary has a diameter of the order of 10,000 times the distance between the earth and sun, and, according to L. Goldberg and L. H. Aller of the Harvard observatory, the average total amount of matter in a planetary nebula is less than $\frac{1}{5}$ that in the sun. These figures give some notion of the extreme tenuity of the gases composing these nebulae, since the density indicated, several hundred atoms per cu.in., is far less than the best vacuum obtained on the earth.

Motions.—Because they have bright-line spectra, the radial velocities of planetary nebulae are easily and accurately determined. Spectroscopic observation has shown that their motions are moderately high, averaging 15 mi. per second, a value intermediate between those for the diffuse nebulae and the globular star clusters. In 1937 L. Berman, from an analysis of the radial velocities of 110 planetaries determined prior to 1918 by J. H. Moore and W. W. Campbell at the Lick observatory, showed that these nebulae participate in the rotation of the stars about the galactic centre 30,000 light-years distant in the direction of Sagittarius. Another significant and valuable result from Campbell and Moore's work was the discovery of turbulence in the gases composing the planetary nebulae. From the fact that the spectrum lines were found to be curved, and in some cases doubled, it may

be concluded that the nebular gases are in motion, and in general expanding from the central star. The velocity of expansion, however, is relatively low, being about 10 to 15 mi. per second. Furthermore, from the fact that some of the bright nebular lines were observed to be inclined, it appears that in these cases the nebulae are not only expanding, but are also slowly rotating. However, the complex structure seen in some planetaries finds no such simple explanation, and it must be admitted that in these instances the turbulence of the nebular gases is still a very puzzling phenomenon.

Origin.—The question as to what place, if any, the planetary nebulae take in the scheme of stellar evolution is a difficult one, to which at present there is no certain answer. It has often been suggested that they represent a later stage in the life history of the "new" stars (novae), because: (1) in a number of cases novae have been observed to throw off expanding shells of gaseous matter; and (2) M. L. Humason showed in 1938 for 16 faint, "old" novae that they ultimately tend to become small and extremely hot stars very similar to the central stars in the planetary nebulae. The principal objection to this hypothesis is that the velocities of expansion of the nebular matter usually are of a different order of magnitude, being hundreds of miles per second in novae and only a few miles per second in planetaries. While it can be argued that the nebular shells around novae may slow down in time, there is little evidence that this has occurred in any of the novae observed in modern times; in fact, there seems to be more reason to regard the motion as essentially uniform. On the basis of this assumption, F. L. Whipple of Harvard in 1938 deduced ages for the planetary nebulae of the order of 30,000 years, which is but a fleeting moment in the time-scale of the stars.

The Gaseous Spectrum of the Nebulae.—The spectra of all gaseous nebulae, diffuse and planetary, are very similar in appearance, the differences consisting chiefly in the relative intensities of the bright lines. The lines in the spectra are sharp, a fact which indicates a gas of low density; those of hydrogen are prominent and those of helium are usually present. But for more than 60 years following 1864, when William Huggins first observed the spectrum of a nebula, there were several lines (a wide pair in the green at 5007 and 4959 A, and a close pair in the ultraviolet at 3726 and 3729 A), among the strongest in the spectrum, which remained unidentified. Their origin was one of the most puzzling mysteries in astronomy, and for lack of a better name, they were attributed to a hypothetical element called "Nebulium," although it was generally realized, because of advances in chemistry and physics which left no place in the table of known elements for foreign ones, that the occurrence of the strange lines probably was due to some familiar element existing under conditions peculiar to the nebulae. That this explanation is the correct one was established in 1927 by I. S. Bowen. He showed on the basis of laboratory work and reasonable theoretical considerations that the chief nebular lines are due to singly and doubly ionized oxygen atoms, which radiate light under conditions of low density and high excitation unmatched on the earth.

Forbidden and Permitted Lines.—To understand why certain lines occur in the nebulae and not in terrestrial sources, and vice versa, it is necessary to mention a few of the fundamental principles of modern atomic theory. In this concept, atoms exist in certain definite energy states, depending on their environment. The energy states correspond to orbits in which electrons move about the nucleus, and when an electron jumps from one orbit to another, energy is absorbed, or emitted, depending on whether the jump is from an inner to an outer orbit, or the other way around. The electrons, however, do not remain in the different kinds of orbits for equal times, and it is this property of the atom, together with its environment, which is responsible for the characteristic nebular radiations. The latter represent jumps to orbits in which electrons can move for seconds, minutes and possibly hours, whereas radiations observed in terrestrial light sources correspond to transitions between orbits in which electrons remain for only 1/100,000,000 of a second. Spectral rays from long-lived orbits are called "forbidden" lines, those from the short-lived orbits "permitted" lines, and the reason only the latter are obtained in the laboratory is that collisions between atoms, even with the lowest obtainable densities, are so numerous (millions per second) that electrons are almost always knocked from the long-lived orbits before they have a chance to jump to an inner orbit, with the resultant emission of a forbidden line. In the nebulae, however, the extremely low densities allow sufficient electrons to accumulate in the long-lived orbits (called "metastable states") to yield intense forbidden lines.

Physical Processes and Sources of Energy.—In addition to demonstrating the existence of an almost perfect vacuum in gaseous nebulae, the forbidden lines, being due to ionized atoms (those which have lost one or more electrons), indicate the presence in planetaries of a very high-temperature source of energy. Evidence for this is provided by two apparently unrelated features of the nebular spectrum: (1) the size of a nebula is different in different radiations, and (2) only certain of the permitted lines of neutral oxygen and nitrogen are observed. The first of these properties, originally noted in 1908 by Wolf, and later (1918) extensively studied by W. H. Wright in the most thorough and significant investigation of the spectra of the gaseous nebulae, shows that the smallest nebular diameters correspond to the most highly ionized atoms, and the largest to the least, in just the way to be expected from Bowen's high-temperature theory of the structure of planetary nebulae. The second feature was likewise explained by Bowen as the result of an intense concentration of energy in the far ultraviolet, characteristic of a high-temperature source, which selectively excites the observed lines by a fluorescent mechanism. That the central stars of planetary nebulae are in reality among the hottest objects known was also established by Wright's observations of the spectra of planetary nuclei. Subsequent theoretical investigations by H. Zanstra, A. S. Eddington and D. H. Menzel have fully substantiated Wright's earlier deductions from observations, and Bowen's conclusions from identification of the chief lines, that the dominating physical conditions in gaseous nebulae are extremes of low density in the nebulae and of high temperature in the central stars, which are the ultimate source of all nebular radiations.

Abundances of the Nebular Gases.—Following his explanation of the origin of the nebular lines, and the mechanism of their production, Bowen in 1934 concluded that the gaseous nebulae, like most astronomical bodies, are largely made up of hydrogen, with helium the next most abundant element. Further information on their chemical composition was obtained in 1939 by Bowen and A. B. Wyse at the Lick observatory. By using an especially powerful spectrograph in combination with an "image slicer" (invented by Bowen to overcome certain observational difficulties), and exposures of 12 to 20 hours, they were able to record in two planetary nebulae a number of faint radiations due to the metallic and other elements. Analysis of the intensities of these lines, and comparison of results with similar work by H. N. Russell on the sun, led to the conclusion that the abundances of many elements in the nebulae and sun are not significantly different. Wyse in 1942 extended the program to include 10 additional planetary nebulae and the Orion nebula, and deduced that the chemical compositions in both types of nebulae are similar to that of the sun. In an independent and more elaborate theoretical treatment of the problem, D. H. Menzel and a number of associates at Harvard

Average Composition of a Planetary Nebula Compared with that of the Sun

Chemical Element	Relative Number of Atoms	
	Nebula	Sun
Hydrogen	1000	1000
Helium	100	222
Carbon	0.6	0.04
Nitrogen	0.2	0.12
Oxygen	0.25	0.37
Fluorine	0 0001	....
Neon	0 01	....
Sulphur	0.036	0 037
Chlorine	0.002	..
Argon	0 0015	....

came to the same conclusion in the last of a long series of papers published in 1945. Their final results, which represent the most modern estimates of the cosmical abundances of the lighter elements, are given in the table on page 187B.

THE EXTRAGALACTIC NEBULAE

The extragalactic nebulae are found scattered all over the sky except in the Milky Way itself, which they rigidly avoid. This characteristic is, however, by no means the only thing that differentiates them from the galactic nebulae, and the most casual study soon shows them to be objects of quite a different nature. They vary in apparent size from the great spiral in Andromeda, which has been traced to a diameter of more than 6°, to objects so small that even in the largest telescopes they are barely distinguishable from the faintest stars. The number of such nebulae is enormous and depends upon the limiting brightness to which they are counted. For example, there are approximately 1,000 catalogued to the 13th magnitude, and they increase geometrically by a factor of four for each fainter magnitude reached; thus 4,000 could be counted to the 14th magnitude, 16,000 to the 15th, etc., until at magnitude 21.5, which is the limit of the 100-in. Mount Wilson reflector, some 100,000,000 extragalactic nebulae could be photographed. That each one of these objects is now known to be a stellar system, or "island universe," similar in some cases to our own giant Milky Way, is an achievement of modern astronomy which has immeasurably widened our view of the observable universe. The giant systems among the faintest nebulae counted lie at distances of the order of 500,000,000 light-years. With present resources, therefore, we are able to encompass a vast sphere 1,000,000,000 light-years in diameter. This great volume of space is by no means fully explored, but enough has been learned, especially from large reflectors and powerful spectroscopes, to indicate something of its physical properties and of its stellar systems.

Classification.—The most generally accepted scheme of classification for the extragalactic nebulae is the one proposed by Hubble in 1926. It is represented schematically in fig 1. This

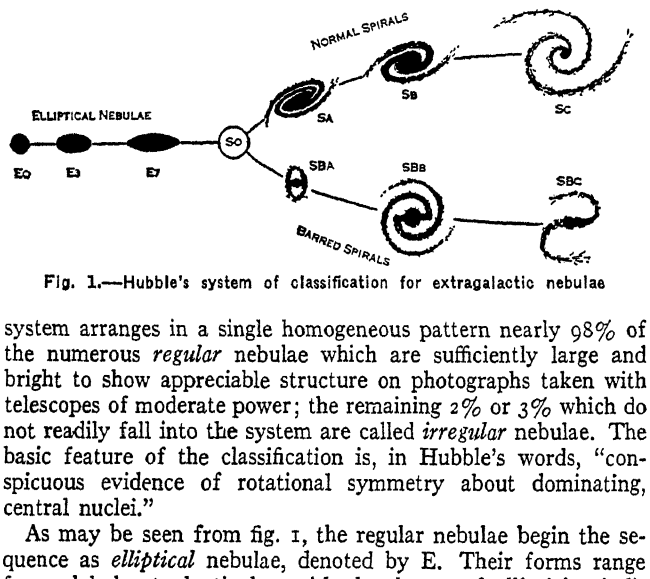

Fig. 1.—Hubble's system of classification for extragalactic nebulae

system arranges in a single homogeneous pattern nearly 98% of the numerous *regular* nebulae which are sufficiently large and bright to show appreciable structure on photographs taken with telescopes of moderate power; the remaining 2% or 3% which do not readily fall into the system are called *irregular* nebulae. The basic feature of the classification is, in Hubble's words, "conspicuous evidence of rotational symmetry about dominating, central nuclei."

As may be seen from fig. 1, the regular nebulae begin the sequence as *elliptical* nebulae, denoted by E. Their forms range from globular to lenticular, with the degree of ellipticity indicated by numerals from 0 to 7, which are obtained from the relation $10(a-b)/a$, where a and b are the major and minor axes, respectively. Statistical analysis of the frequency of occurrence of the different forms shows that there are actually globular or spherical nebulae, and that not all of the apparently round ones can be accounted for as flattened nebulae with polar axes in the line of sight. The analysis shows, however, that the lenticular objects are much more common, and that there is a definite limiting ellipticity with ratio of axes 3 to 1. When the flattening becomes greater, the nebulae no longer appear as smooth, unresolved objects, and, at a certain stage of the sequence, indicated by *So*, they begin to show structure which in general is of *spiral* character. Two different spiral forms are found, however, so that the spiral nebulae are separated into two groups: the *normal* spirals, designated by *S*, and the barred spirals, symbolized by *SB*. The latter, first noted as a distinct class in 1918 by H. D. Curtis who termed them "phi-type" (ϕ) spirals, are in the minority, for less than 1 spiral in 2 or 3 is barred.

Among the regular nebulae large and bright enough to classify, the spirals outnumber the ellipticals by more than 4 to 1, and this fact stresses the importance of deciding which features in spirals are best suited for further subdivision, such as central concentration, relative size of arms and nucleus, or number and character of condensations. After an examination of hundreds of nebulae on photographs taken with the Mount Wilson reflectors, Hubble concluded that the most significant characteristic for classifying spirals is the *degree of resolution.* Depending upon circumstances, the resolution may be only into spiral structure, into clusters or clouds of stars or, at best, into individual stars. To indicate the degree of resolution the letters *a, b* or *c* are placed after *S* or *SB;* thus, a well-resolved normal spiral would be referred to as *Sc,* a barred one as *SBc.*

Nebular Evolution.—The classification described above arranges the extragalactic nebulae into a consistent pattern in which such important features as linear diameters of the main bodies, spectral types, colours and intrinsic luminosities of the brightest stars all vary uniformly along the sequence. It is tempting to suppose that this sequence gives us a picture of an evolutionary process whereby a spiral nebula develops from a structureless globular system into a galaxy of stars by the continued ejection of matter from the nucleus along the spiral arms. That such a process is mathematically possible was first considered in 1928 by J. H. Jeans, and later in 1933–41 by B. Lindblad. According to theory, a nearly spherical, slowly-rotating nebula spins faster as it contracts, thus becoming more flattened. Tides raised on opposite sides of the equator by some external disturbance form protuberances which are then projected as arms. These wind around the central mass and are disintegrated into groups of condensations which ultimately become stars. The process must be an extremely slow one, involving millions upon millions of years, and we cannot expect to see even during many centuries any changes in the form of a particular nebula. Although such theory is invaluable as a logical synthesis of the available data relating to nebular contents and structure, the factual knowledge is still too meager to permit definite conclusions regarding the course of nebular evolution. Hence, while in practise the terms "early-" and "late-type" spirals (*Sa* and *Sc,* respectively) are often employed, it is done only to indicate relative position in the sequence; there is no implication of an underlying time scale. Observational astronomy, at least, is not yet prepared to assert that the direction of nebular evolution is established by classification.

Distribution.—As the result of extensive counts of extragalactic nebulae on photographs taken chiefly at the Mount Wilson observatory in the northern hemisphere, and at the Harvard college observatory station in the southern hemisphere, it is known that, on the grand scale, the distribution is approximately *uniform* both over the sky and in depth. This result, of great theoretical and practical value for cosmological studies, was obtained only after much modern work which elucidated the effects of galactic obscuration, and of several great clusters of nebulae, upon the true distribution.

Distribution Over the Sky.—Long before the advent of photography it was generally known that the "white" nebulae, now called extragalactic, tended to avoid the Milky Way, and that there was appreciable clustering in high galactic latitudes, especially in Coma and Virgo close to the north pole of the Galaxy. With the development of photography, more and ever more nebulae were counted, and the galactic zone of avoidance and the regions of clustering became more precisely defined. A number of early counts, among them those of J. E. Keeler (1899), E. A. Fath (1914) and H. D. Curtis (1918), suggested the general outlines of the distribution and gave hints as to the total number of nebulae within reach of certain telescopes, but the problem of

TWO TYPES OF GALACTIC DIFFUSE NEBULAE

1. Great Nebula in Orion (M42, N.G.C. 1976). The light of this nebula consists of bright rays characteristic of the atoms of hydrogen, helium, oxygen and nitrogen. These gases, highly rarefied, are excited to luminosity by ultra-violet radiation emitted by hot (20,000° C.) stars imbedded in the nebula. Approximate distance and size of nebula, 1,000 and 80 light-years, respectively

2. Pleiades (M45). This nebulosity is reflected and scattered starlight. Stars in the cluster provide the light, and surrounding clouds of finely divided dust particles reflect and scatter the rays from the stars. Distance to cluster, 490 light-years

GALACTIC DIFFUSE (MIXED BRIGHT AND DARK), AND PLANETARY NEBULAE

1. Lagoon Nebula (M8, N.G.C. 6523) in Sagittarius; an example of a star cluster with mixed bright and dark nebulosity
2. Horse-head Nebula (N.G.C. 2023) south of star Zeta Orionis; a denser part of a dark cloud in front of several stars
3. Ring Nebula (N.G.C. 6720) in Lyra; a shell of gas made to shine by the central, very hot star
4. Owl Nebula (N.G.C. 3587) in Ursa Major; a nearly spherical volume of gas excited to luminosity by the central, hot star

EXTRAGALACTIC NEBULAE: THE TWO NEAREST SPIRALS

1. Andromeda Nebula (M31, N.G.C. 224). This is a spiral, giant galaxy of stars, distant 750,000 light-years. Its full size is more than three times that shown in this photograph, or 80,000 light-years in diameter. The spiral contains star clusters, diffuse gaseous nebulae, variable stars, and thousands of millions of stars similar to those found in our own galaxy. If the latter, the Milky Way stellar system, could be viewed from a distance of nearly 1,000,000 light-years, it probably would resemble the Andromeda nebula

2. Spiral in Triangulum (M33, N.G.C. 598). This system, only 14° away from the Andromeda nebula and at the same distance, is a galaxy of more nearly average size and luminosity. It is highly resolved into stars and has many diffuse gaseous nebulae and variable stars

THE VELOCITY-DISTANCE RELATION

The arrows in the left-hand column of nebular spectra point to the H and K lines of calcium (unresolved in the lowest spectrum). The lengths of the arrows show the amounts the spectrum lines are displaced toward longer wave lengths; *i.e.*, they show the "red-shifts" in the spectra, expressed in miles per second. The comparison spectra are of helium

In the right-hand column, direct photographs, of nearly the same scale and exposure time, illustrate the decrease in size and apparent brightness of the nebulae with increasing distance, expressed in light-years (l.y.). When the distances are plotted against the velocities, there is obtained a straight-line relation, known as Hubble's velocity-distance relation

1

ROTATIONAL VELOCITIES OF 20 EMISSION CONDENSATIONS IN MESSIER 33

ROTATION OF THE TWO NEAREST SPIRAL NEBULAE

1. Spiral in Andromeda (M31). 2. Spiral in Triangulum (M33). The direct photographs above, with the diagrams below, show points in the spirals with their corresponding velocities (in the line of sight), which indicate that these two galaxies are rotating. The objects encircled in M31, and marked with arrows in M33, are all diffuse gaseous nebulae, observed because their bright-line spectra are easiest to record and to measure. The scale of linear distances at the top of the diagrams is in the stellar distance unit called the *parsec*, which equals 3¼ light-years. The velocity scales on the right- and left-hand margins are in *kilometres* per second; multiplication of the numbers shown by 0.621 will express them in *miles* per second

From the velocities observed, it can be shown that different parts of the spirals turn at different rates; thus, the calculated periods of rotation in M31 are 11,000,000 years for the small nuclear region, and 92,000,000 years for the main body. In M33, the main body turns once in 59,000,000 years, and the outer parts once in 60,000,000 to 200,000,000 years

nebular counts was not put on a firm quantitative basis until 1934. In that year Hubble published the results of surveys, made with the Mount Wilson reflectors, in which more than 44,000 nebulae were counted in 1,300 sample regions fairly evenly distributed over three-fourths of the sky. For the first time, the counts were calibrated and referred to specified limiting magnitudes. With all the data reduced to standard conditions, it became clear that the numbers of nebulae decreased in a very regular way as the Milky Way was approached. The rate of decrease, in fact, was just that to be expected from a thin obscuring layer in which the absorption is proportional to the light path in the stratum—a familiar analogy is the dimming of stars as they approach the horizon. The zone of avoidance along the Galaxy is thus but the effect of looking in the plane of the stratum, where the absorption is a maximum which approaches complete opacity; toward the galactic poles, the absorption is a minimum, with the light reduced by only 20%. The more populous areas, on the other hand, represent a conspicuous tendency for the nebulae to cluster. They occur in pairs, in small to large groups of several to 100 nebulae, and in great clusters which include more than 500 members, as in the Coma and Virgo aggregations.

Numbers and Distribution in Depth.—Of equal or greater importance than the delineation of regions of avoidance and of clustering is the conclusion, first reached by Hubble, that the extragalactic nebulae populate space with an approximately constant density as far as telescopes can reach. This result was obtained from counts of nebulae to successively fainter limiting magnitudes. For the brightest objects, it is only necessary to total to each limiting magnitude the number of nebulae whose magnitudes have been individually determined, as for example, in the extensive Harvard surveys reported by Shapley. For the faintest objects, on the other hand, it is much simpler to count nebulae to limiting magnitudes determined by exposures of different lengths, or by telescopes of different light-gathering power. This indirect procedure is expedient because the faintest nebulae are overwhelmingly too numerous to estimate their individual brightnesses. With the numbers of nebulae established to increasingly fainter magnitudes, it is relatively easy to test the hypothesis of constant space density. This is done by noting whether the numbers of nebulae counted are proportional to the volumes of space in which they are found. More precisely, a simple calculation shows that the rate of increase is by a factor of four when the limiting brightness decreases by one magnitude. On the basis of all the available material, Hubble found that this condition was satisfied when large volumes of space were involved. His numerical results may be transcribed into the following table, which shows how the nebulae increase in number with diminishing brightness, which in turn indicates increasing distance. The numbers tabulated represent average values which do not allow for the effects of galactic absorption or of red-shifts in the nebular spectra. Corrections for these disturbing influences, which reduce the number of nebulae, are important in precise, quantitative studies, but their detailed consideration is beyond the scope of this article.

Distribution of Extragalactic Nebulae in Depth
(Based on the Assumption of Constant Space Density)

Apparent Magnitude (Photographic)	Average Distance (Light-Years)	Numbers of Nebulae	
		Per Sq. Deg.	Whole Sky
10	3,400,000	0.00081	34
12	8,600,000	0.013	540
14	21,500,000	0.20	8,500
16	54,000,000	3.2	135,000
18	136,000,000	51	2,100,000
20	342,000,000	810	34,000,000

Deviations from Uniform Distribution.—The Harvard surveys of galaxies to the 18th magnitude, which by 1942 had covered more than half the sky observable from both northern and southern latitudes, contributed significantly to more detailed investigations of the departures from the uniformity of distribution which Hubble proved to exist in a statistical sense. According to Shapley, the Harvard counts disclose the presence of 25 clusters of galaxies at least as rich as the Virgo system, of 100 groups having a dozen or so members, and of thousands of distributional irregularities that suggest physical associations. Comparison of results from the northern and southern galactic hemispheres seems to show a 40% larger average population in the north to the 18th magnitude, but the difference disappears between the 18th to 20th magnitudes. Should further observations prove the inequality to be real, there would be required some such novel explanation as "a great cloud of galaxies 100,000,000 light-years distant beyond the northern constellations, or a major continuous south-to-north density increase." Two other more localized density surpluses were found in one great belt of tens of thousands of galaxies extending from the Milky Way through Andromeda, Triangulum, Perseus and Pegasus, and in another better-defined stratum ranging through the far southern constellations of Pictor and Dorado, in which the average density appears to be 50% higher than elsewhere in the southern sky. Notwithstanding these very interesting belts and clouds of galaxies, whenever very large volumes of space are compared, the unevenness tends to disappear, and in general the Harvard counts over large areas to brighter magnitudes fully substantiate the uniform density deduced from the Mount Wilson counts in small sample areas to very faint magnitudes.

Distance Determinations.—Distances of extragalactic nebulae are most accurately determined from studies of their constituent stars. In principle, the procedure is to identify the character of the involved stars, and then to compare their apparent brightnesses with those of corresponding stars in the galaxy. The galactic stars with which the comparison is made have known *absolute magnitudes,* that is to say, their true brightnesses, or luminosities, have been found from trigonometric methods which are similar to those used in surveying. Since the apparent and absolute magnitudes, and the distance, are related to each other by a simple formula based on the assumption that light is weakened inversely as the square of the distance, wherever an object of known absolute magnitude, such as a star, can be identified in a nebula, the latter's distance can be obtained. In practice, however, the use of involved stars as distance indicators is difficult, because large telescopes are needed to resolve nebulae into their brightest stars; also the method is limited to a comparatively small number—several hundred—of the nearer nebulae. In order of decreasing accuracy, but of wider use because of increasing luminosity, those involved stars which are useful as distance indicators are: *Cepheid variables, Supergiant stars* and *Novae.* For the millions of nebulae so distant that none of these stars can be detected in them, distances are estimated from *total magnitudes* of the nebulae, and from *red-shifts* in the nebular spectra. On the basis of these methods, largely developed by Hubble in a series of comprehensive researches from 1924 to 1940, the scale of distances in the observable universe has been extended to 500,000,000 light-years. How this was accomplished is outlined in the following paragraphs.

Cepheid Variables. Shortly after the turn of the century, Henrietta S. Leavitt of the Harvard observatory found from studies of certain variable stars in the Magellanic Clouds that the periods of light variation were closely correlated with the apparent magnitudes. Since the Cloud variables were all at nearly the same distance, the relation was actually one between period and real brightness. The significance of Miss Leavitt's discovery was at once realized by Ejnar Hertzsprung and others, who pointed out that these variables are giants, or high luminosity stars, similar to the familiar galactic Cepheids, so named after the prototype δ Cephei. Since the distances of the galactic Cepheids were approximately known from investigations of their radial and transverse motions, Miss Leavitt's *period-luminosity law* could be calibrated. In other words, the relation could be used to give distances of objects containing Cepheid variables. In this way the distances of the Magellanic Clouds have been found to be about 80,000 light-years. At this distance, Cepheids are fairly easy objects to detect, even with telescopes of moderate power, for variables having a 30-day period are somewhat brighter than the 13th magnitude at maximum light. The case is altogether different, however, for the discovery of these variables in the nearest spirals, those in Andromeda and Triangulum. Cepheids in them are so faint (18th magnitude or fainter) that they were not discovered until 1923, when Hubble began to use the 100-in. telescope to investigate the nature of the extragalactic nebulae. By 1929 he had identified 75 Cepheids in these two spirals, and had established their distances as about 900,000 light-years, without correction for galactic absorption. This result settled once

and for all the long-standing controversy concerning the true nature of the spiral nebulae: they are in reality vast "island universes," or galaxies of stars, far beyond our own Milky Way system. While the Cepheids in this manner supplied the key to the proper scale of the universe, their usefulness as extragalactic distance indicators has been restricted to about a dozen known nearby stellar systems, all of which are less than 1,000,000 light-years distant, and which comprise what is called the Local Group (*see* section below, *The Local Group*).

Supergiants.—These are bluish-white, very hot stars which generally appear as the brightest stars in the nearer of the extragalactic nebulae. From an investigation of 150 systems published in 1935, Hubble found that the very brightest stars in "late" spirals (type *Sc*) were about of the same order of luminosity—50,000 times that of the sun. This "supergiant" distance criterion has proved to be of great value, for it provided distances for a sufficient number of nebulae to permit statistical studies of entire nebulae, rather than of their constituent stars. The way was thus opened for the use of a much brighter source as a distance indicator, namely, the light of a whole nebula, discussed in the second paragraph below.

Novae. Although these temporary stars first directed attention to the study of the stellar contents of nebulae as distance indicators, and their use for that purpose antedated by a few years the Cepheids, novae originally gave an ambiguous answer to the puzzling question of the distances of the spirals. The trouble arose from the fact that there are two kinds of novae: *normal* novae and *super*novae, the latter several thousand times brighter than the former. The numerous novae in the Andromeda nebula, first photographed by G. W. Ritchey, form the fainter group, while those rarely found in the other and much fainter nebulae make up the other and brighter group. To use either group for distance determinations, however, required their comparison with the galactic novae. The point at issue, therefore, was whether the galactic novae were to be regarded as normal or supernovae. It is now known that both types of novae have occurred in the Galaxy and in the nebulae, and unless the distinction can be made in the individual cases, even the order of distance, whether galactic or extragalactic, is indeterminate. K. Lundmark, of Lund, Sweden, in 1920 pointed out the probability of two separate classes of novae, and contemporaneous discussions by Curtis and Shapley clearly set forth the difficulties of establishing by means of the novae a scale of distances for spirals. It was only after 1936, when F. Zwicky and W. Baade initiated a program on Mount Palomar to discover supernovae (with an 18-in. Schmidt-type telescope), that sufficient data were obtained on these greatest of stellar outbursts to indicate how novae in general may be used to check the order of distance. Because two different luminosity groups of supernovae were identified, and because even normal novae differ considerably in real brightness, the result is that novae as distance indicators are of value mainly as corroborative evidence.

Total Magnitudes.—In the case of the sample group of extragalactic nebulae whose distances became known from his study of the supergiant stars within them, Hubble was able to investigate the range, or scatter, in their total *absolute* magnitudes from measures of their total *apparent* magnitudes. It was found, as for the stars, that these nebulae do not have the same luminosity, but that an *average* of a sufficient number, properly selected, provides a valuable criterion of distance. This average value, called the *mean absolute magnitude* of nebulae in general, is undoubtedly the brightest light unit yet used, for it amounts to 85,000,000 suns. With a light source of this intensity, the extragalactic distance scale can be extended to more than 200,000,000 light-years. Distances of this order have been reliably determined for a number of the large clusters of nebulae, for in them it is possible to obtain an accurate average value of the most frequent total *apparent* magnitude. Comparison of the latter with the mean *absolute* magnitude of nebulae then gives, by a simple calculation, the distance to the cluster. The very greatest distances are found when a cluster is so faint that only its brightest members can be photographed. In these cases the mean or most frequent magnitude of cluster nebulae is estimated as ten times fainter than the brightest member, or seven times fainter than the 5th brightest member, which is statistically more accurate. The most remote cluster observed with the spectrograph is estimated in this way to be distant 230,000,000 light-years. Beyond this distance it is difficult to locate true clusters of nebulae, for only the brightest members can be photographed. Nevertheless, among the very faintest nebulae which can be identified on long exposures made with the 100-in. reflector, there are some which are giants. These average more than four times brighter than the normal nebulae, and thus giants can be detected twice as far. In this manner space has been penetrated to distances of the order of 500,000,000 light-years with the largest telescope in operation.

Red-Shifts.—In 1912 V. M. Slipher first measured the radial velocity, or speed in the line of sight, of an extragalactic nebula—the spiral in Andromeda. Since his initial spectroscopic observations were of the nearest and brightest objects, the fact that the radial velocities in some cases indicated approach, and in others recession, did not at first excite abnormal interest. It was noted, however, that the velocities were above average, in some cases exceeding the highest known velocities for stars. As Slipher continued his spectrum observations, extending them to include fainter nebulae, he found that the radial velocities were predominantly of recession, and, most remarkably, they were unexpectedly large, up to 1,000 mi. per second. These results naturally aroused great interest, and they provided additional evidence that the extragalactic nebulae were indeed set apart from all other objects in the sky. Attempts to connect these velocities of recession, considered enormous in their time, with other characteristics of the nebulae, met with general failure until suitable distance criteria were developed.

The Velocity-Distance Relation.—Following his discovery of Cepheids in the Andromeda nebula in 1923, Hubble proceeded to develop the method of brightest stars as a means of estimating distances of spirals. By 1929 he had deduced distances for 18 nebulae from their supergiant stars, as well as distances for four spirals in the Virgo cluster from the mean luminosity of all nebulae in the cluster. With these 22 objects, for which both radial velocities and reliable distances were available, Hubble announced in 1929, one of the most outstanding results of modern astronomy: a *velocity-distance relation* for extragalactic nebulae. According to this relation, the more distant a nebula, the greater is its velocity of recession (*red*ward shift of its spectrum lines). In the original formulation, a distance of 6,500,000 light-years was reached, but the range was rapidly extended by additional observations of fainter cluster nebulae, for which Hubble estimated distances from total magnitudes, and for which Humason measured radial velocities by a powerful spectroscope of radically new design. This new and much more extensive material demonstrated by 1936 that the relation between velocity and distance was valid for distances of more than 200,000,000 light-years and for velocities up tc 25,000 mi. per second. Moreover, the correlation was so precise it could be used to obtain distances of individual nebulae. Since the rate of increase of recession is closely 100 mi. per second for every 1,000,000 light-years, the distance of a nebula, in millions of light-years, is simply obtained by dividing its radial velocity, in miles per second, by 100. This method of estimating distances from red-shifts is especially valuable for faint nebulae, because for them the error in determining a radial velocity is small compared with their velocities. In fact, the percentage accuracy increases with the distance, and at the point where luminosity methods become increasingly uncertain, the red-shift measures become relatively precise—a most fortunate circumstance for the investigation of the depths of the universe.

The Local Group.—Following the establishment by Hubble of a reliable distance scale for extragalactic objects, it soon became evident that the Galaxy is a member of a small group of relatively nearby systems which are conspicuously isolated from the next nearest galaxies. The Local Group includes 13 recognized members, with several other objects, heavily obscured by galactic dust clouds, as possible additions. The group contains the Galaxy with its attendant Magellanic Clouds, the Andromeda nebula with four satellites, the spiral in Triangulum and four dwarf systems. These objects have proved of great value for studies of the structures and stellar constitution of a representative collection of nebulae, with the results from their investigation making possible the development of criteria for further exploration. The characteristics of some individual members are discussed below.

The Magellanic Clouds.—Chiefly as the result of observations made at the Harvard observatory's stations in the southern hemisphere, the distances, sizes and nature of their stellar contents have become fairly well known. From the period-luminosity law for Cepheid variables (see above section, *Cepheid Variables*), the distance of the large cloud is found to be 75,000 light-years, and of the small cloud, 84,000 light-years. There remained in 1946 a little uncertainty due to the presence of absorbing matter in our own Milky Way, which, it was estimated, dims the light from the clouds by 13%. The cloud centres are separated by 21°, or by 30,000 light-years. On ordinary photographs each cloud appears to be a concentrated and irregular mass of stars, the large cloud about 10,000 light-years in diameter and the small cloud half as large. On small scale photographs of long exposure, however, the brighter parts seem to be surrounded by a faint haze of stars which nearly doubles the extent of each object; thus there is the possibility that the two clouds may even overlap in some degree. Because of the relative nearness of the clouds, such objects as open star clusters (like the Pleiades and Hyades), globular star clusters, diffuse nebulae, variable stars, several novae and ordinary stars down to a luminosity ten times that of the sun, have been identified and studied. The small cloud appears to be exceptionally rich in variable stars, with 2½% of the stars brighter than the 17th magnitude showing variability; supergiants are exceptionally frequent in the large cloud, which contains the brightest known irregular variable, *S* Doradus, nearly 500,000 times more luminous than the sun. Together with more than 100 giant and supergiant stars, it is located in an enormous mass of diffuse nebulosity, hundreds of light-years across, which dwarfs in size and brilliance the Orion nebula. The radial velocities of both clouds were determined in 1918 by R. E. Wilson at the southern station of the Lick observatory, in Santiago, Chile. The motions are apparently 100 mi. and 170 mi. per second recession, for the small and large clouds, respectively, but they are almost wholly the reflection of the sun's rotation about the galactic centre 30,000 light-years distant in Sagittarius. The Magellanic Clouds have proved to be invaluable as objects in which the giant and supergiant ranges of stellar luminosity may be studied, for in these nearby systems astronomers find the very fortunate circumstance of the same distance for all stars concerned, so that differences in apparent brightness represent differences in real brightness.

The Andromeda Nebula.—As the largest and nearest spiral, this has been, and probably will continue to be, one of the most intensively investigated objects in the sky. Since it is a real giant among extragalactic nebulae, comparative studies of it with the Galaxy offer some of the most fruitful means of learning more about our own Milky Way system, so much of which is hidden from view by the stratum of interstellar dust clouds. Since the spiral lies only 21° from the galactic plane, its distance is somewhat uncertain because of galactic absorption, and the best modern estimates place the system at 750,000 light-years, with an uncertainty of perhaps 10%. At this distance the main body of the spiral, as shown on most photographs, is 30,000 light-years in diameter, but photo-electric cell measures reported by Joel Stebbins and A. E. Whitford in 1934, suggested a diameter of at least 70,000 light-years. In 1941, R. C. Williams and W. A. Hiltner, by using a highly sensitive microdensitometer of their own design, traced the outlines of the spiral, on a photograph taken with an 18-in. Schmidt telescope on Mount Palomar, to a distance of 80,000 light-years. This figure is closely comparable with the size of the Galaxy when allowance is made for the effects of galactic obscuration. Despite the large distance to the spiral, Cepheid variables, supergiant stars, normal novae and globular clusters have been detected in considerable numbers with the 100-in. telescope. There are a few gaseous nebulae known, and probably many more remain to be discovered, but because of their faintness, their identification with a spectrograph will require time.

In the most recent photographic work on the Andromeda nebula, W. Baade in 1944 reported the resolution of the amorphous nuclear region into myriads of faint stars. This remarkable achievement was accomplished by using the 100-in. telescope in the most skillful manner under critically good conditions, and by using photographic plates highly sensitive to red light. In addition, and by the same method, he resolved into stars the two close companion nebulae of the spiral. The brightest of these satellites is a typical elliptical nebula, and Baade's demonstration that it is composed of stars settled the question of the constitution of the innumerable similar nebulae. At the same time he showed that two more nearby objects, hitherto unresolved, also are companions of the Andromeda nebula, which is now revealed as a giant accompanied by four dwarfs of decreasing size and luminosity. Baade's unsurpassed photographs not only resolved all five objects, but showed that, in certain systems, especially in the elliptical nebulae, supergiant stars are absent. From a more detailed analysis, Baade was led to conclude that there are two fundamentally different types of stellar populations, which are present in different proportions in spiral, elliptical and dwarf irregular nebulae, with the different frequencies accounting for the character of the observed structures and stellar contents. The discovery was in 1946 as yet too new to be fully appraised, but it seemed likely to serve as a fruitful point of departure for many future investigations of stars in the extragalactic nebulae and in the Galaxy.

Nearby Dwarf Systems.—Besides those associated with the Andromeda Nebula, there are known four other relatively close dwarf systems, N.G.C. 6822 and I.C. 1613, which are irregular nebulae having supergiant stars, and two objects in the southern constellations of Fornax and Sculptor reported by Shapley in 1938, which are elliptical nebulae of very low central concentration lacking supergiants. Their distances, which range from 220,000 to 730,000 light-years, and their distribution in the sky, indicate that these dwarfs are essentially isolated from the other members of the Local Group. In the two irregular systems having supergiants, such familiar objects as Cepheids, globular clusters and several gaseous nebulae have been found, those in N.G.C. 6822 by Hubble, and those in I.C. 1613 by Baade. Because of the similarity in stellar contents, these dwarfs may be regarded as replicas in miniature of the Magellanic Clouds. The Sculptor and Fornax dwarfs, on the other hand, are considered to be low luminosity elliptical nebulae because their brightest stars have the same absolute magnitudes as those in the elliptical companions to the Andromeda nebula. By using the 100-in. reflector, Hubble and Baade in 1939 identified two globular clusters in the Fornax system, and found variables which probably are similar to those found in the galactic globular clusters. While the stellar contents of these dwarfs thus are similar to those of globular clusters, there is still a big gap, as yet unbridged, between elliptical nebulae and globular clusters, for the latter are from 40 to 100 times more dense than, and only 1/10 as large as, the Fornax and Sculptor systems. The importance of discovering and investigating these dwarf systems can hardly be overestimated, for such nearby pygmies offer the possibility of learning much about the stellar constitution of extragalactic nebulae in general, which are much too distant for resolution into their full stellar populations. It is interesting to note in this connection, therefore, that a significant beginning has already been made in the discovery of dwarfs among the nearest galaxies beyond the Local Group. In 1940, F. Zwicky, by means of an 18-in. Schmidt telescope on Mount Palomar, found three very faint dwarfs, apparently of the Magellanic Cloud type, in the constellations of Ursa Major, Leo and Sextans. Preliminary observations of the brightest stars (supergiants) in the latter two systems, reported in 1940 by Baade, indicate distances of about 1,200,000 light-years for these two dwarfs. Since they may also be companions to apparently closeby galaxies not yet resolved into stars, these dwarfs may prove useful as distance indicators. In any case, it is evident that far more of these small, low luminosity objects exist in extragalactic space than was hitherto believed to be the case, and the probable discovery of more such objects by means of the large 48-in. Schmidt telescope under construction on Mount Palomar will be awaited with much interest.

Rotation of Nebulae.—The most casual glance at a spiral nebula suggests rotation, and for nebulae seen nearly edge-on, the spectrograph readily discloses the component of their rotation in the line of sight. The pioneer observations of V. M. Slipher and of Max Wolf in 1914, together with those of F. G. Pease in 1916, showed that the central parts of several of the brighter nebulae, and the nuclear region of the Andromeda nebula, rotate in the fundamental planes of the systems. Because of the inherent observational difficulties, principally the extreme faintness of the nebular light (Pease's exposures extended more than 80 hours), progress in this field has been slow, and even by 1946 only the two largest and nearest spirals, those in Andromeda and Triangulum, had been studied with any approach to completeness. From observations made at the Lick observatory in 1939 by H. W. Babcock, the general nature of the rotation of the Andromeda nebula became known out to its faintest extensions shown on ordinary photographs. Except for an irregularity of motion near the nuclear region, which appears to spin somewhat faster, the spiral rotates almost as a solid body, with a period of 92,000,000 years. Now this type of rotation—as a solid body—was quite unexpected, because in the solar neighborhood of the Galaxy the stars show a "planetary" type of motion, that is to say, they move more slowly around the galactic centre the farther away from it they happen to be. Similar observations of the spiral in Triangulum, reported in 1942 by N. U. Mayall and L. H. Aller of the Lick observatory, show that this smaller galaxy rotates in both ways, the central part as a solid body, the outer parts like objects in the solar system. In a theoretical treatment of the results for both spirals, A. B. Wyse and Mayall in 1942 considered a hypothetical model having a distribution of matter capable of accounting for the observed motions. Comparison of the mass distributions deduced for the spirals, with that for the sun's region in the Galaxy, gave additional support to the current idea that the sun probably is far out from the main body of the Milky Way system of stars.

In addition to providing material for comparative studies of the dynamics and structure of the nebulae and Galaxy, spectroscopic measures of rotation in spirals offer a direct means for estimating their total masses. Such estimates involve the assumption of circular motion in the fundamental place, but, fortunately, spirals contain diffuse gaseous nebulae whose motions in the Galaxy are believed to meet this condition. On this basis, the rotation measures for the Andromeda nebula suggest a total mass of 95,000,000,000 suns for this giant, while for the Triangulum spiral, which is much more of an average system, the observations indicate matter to the amount of 2,000,000,000 suns. By way of comparison, the Galaxy is estimated to have a combined mass of 200,000,000,000 suns, but because of the many uncertainties involved, the difference by a factor of two from the figure for the Andromeda nebula cannot be considered a serious discrepancy. On the broad scale, both systems probably are comparable giants.

Direction of Rotation in Spirals.—Closely allied with the character of the rotational motion of spirals is the question of how the movement takes place with respect to the curvature of the spiral arms; in other words, do the arms appear to be winding or unwinding? Slipher likewise pioneered in this field, and on the basis of his rotation measures and his inferences of the true spatial orientation of the nebulae from their apparent or projected forms, he concluded that all spirals probably rotate in the same manner, namely, that the central part turns into the spiral arms like a coil spring being wound up. The interpretation of photographs of spirals to determine how the systems are located in space is not easy, however, and the criteria used by Slipher—asymmetries in the pattern of dark matter—were later (1934–40) construed in the opposite sense by Bertil Lindblad, whose theory of spiral stellar systems suggested a rotation with the arms leading instead of trailing. The question was completely re-examined in 1942 by Hubble, whose study of the file of hundreds of large-reflector photographs disclosed four spirals suitable as test cases. In these the spiral pattern was plain, and the sense of tilt was unambiguously determined by primary and secondary dark lanes silhouetted against the bright nuclear region. From spectrographic observations of these four crucial-test spirals, made at the Mount Wilson and Lick observatories, it was found that, in each case, the arms trailed. With supporting, but not decisive, evidence provided by similar modern observations of 11 other spirals, Slipher's earlier conclusion now may be accepted as fairly well established, namely, that all spirals rotate in the same way: as the central part turns, the arms lag behind.

Interpretation of the Red-Shift.—Although red-shifts in the spectra of extragalactic nebulae are commonly expressed as velocities of recession, the practice is more traditional than scientific, for it is by no means certain that actual motions of such a large order of magnitude—one-seventh the velocity of light—are involved. What the spectrograph records is wave length (λ), and when the observed wave lengths differ from those of normal value, the difference ($d\lambda$) is, mainly for convenience, expressed as a velocity (v) by means of Doppler's principle, which states that $d\lambda/\lambda = v/V$, where V is the velocity of light (186,000 mi. per second). Except for two facts—(1) that the ratio $d\lambda/\lambda$ is found to be constant in a given nebular spec-

trum, which is a necessary condition for a velocity shift, and (2) that the ordinarily small differences of wave length in stellar sources, such as double stars revolving around their common centre of gravity, are due to motion—there is little direct observational evidence that the very large differences from normal wave lengths of the lines in the nebular spectra represent motion in the line of sight. If the measured red-shifts actually do represent velocity, then they should produce certain small effects on the apparent brightnesses of the faintest nebulae counted. Merely the red-shift alone, apart from any motion, tends to make the nebulae too faint; however, if motion also is involved, the nebulae should appear even fainter, but by such a small amount, only a few per cent for the faintest nebulae counted, that the resources of the greatest of telescopes are strained for its detection. Hubble has examined the matter in detail by making special counts of nebulae to the faintest magnitude attainable with the 100-in. reflector, and he concluded in 1936 that either there is a probable uniform distribution of the nebulae with the red-shift *not* representing motion, or if motion is involved, some "vital factors have been neglected in the investigation." Consideration of what some of the factors are likely to be, such as the different times required for light to come from nebulae at different distances, indicated that their evaluation was more properly in the province of relativistic cosmology. In this highly theoretical field attempts have been made to settle the question, but the crucial test of whether the large nebular red-shifts are velocities probably will consist of further observations, possibly those to be made upon completion of the great 200-in. telescope on Mount Palomar.

BIBLIOGRAPHY.—A fairly complete compilation (to 1932) of articles on nebulae, mainly technical but some nontechnical, may be found in a monograph by Heber D. Curtis, "The Nebulae" published in *Der Handbuch der Astrophysik*, vol. v, part 2, pp. 774–936 (1933). For the extragalactic nebulae, a book by Edwin Hubble, *The Realm of the Nebulae* (1936), is the most scholarly, authoritative and semitechnical work available. A more recent, popularly-written book covering the same field, but dealing mainly with the work of the Harvard observatory, is one by Harlow Shapley, *Galaxies* (1943). The diffuse and planetary nebulae are described in detail by L. Goldberg and L. H. Aller in *Atoms, Stars, and Nebulae* (1943); while our own galactic star system is fully treated by B. and P. Bok in *The Milky Way* (1941). (N. U. M.)

NEBULAR THEORY: *see* COSMOGONY.

NECESSITY: *see* FREE-WILL.

NECK, that part of the body which connects the head with the trunk (*see* ANATOMY: *Superficial and Artistic*). The word is transferred to many objects resembling this part of the body in shape or function; it is thus applied to an isthmus, or to the narrowest portion of a promontory, to the narrow part of a musical stringed instrument connecting the head and body, as in the violin, or to a narrow pass between mountains, which in the Dutch form *nek*, appears in place-names in South Africa. In architecture, the "neck" is that part of the capital just above the "astragal," and the term "necking" is applied to the annulet or round, or series of horizontal mouldings, which separates the capital of a column from the plain part or shaft. In Romanesque work this is sometimes corded.

In Geology, the term "neck" is given to the denuded stump of an extinct volcano. Beneath every volcano there are passages or conduits up which the volcanic materials were forced, and after the mass has been levelled by denudation there is always a more or less circular pipe which marks the site of the crater. This pipe, filled with ashes or lava, is the characteristic of a volcanic neck. Many instances are furnished by the geological history of the British Isles. In Derbyshire, Fife, the Lothians and the Glasgow district the remains of Carboniferous volcanoes occur in every state of preservation. Some have the conical hills of lavas and ashes well preserved (*e.g.*, Largo Law in Fifeshire); others retain only a small part of the original volcanic pile (*e.g.*, Arthur's Seat, Edinburgh; the Binn of Burntisland) and of the larger number nothing remains but the "neck" which shows where once the crater was situated.

In regions of former volcanic activity necks are the most persistent of all volcanic structures, because the active volcanic magma is located deep within the earth's crust, and the pipe by which it rises to the surface is of great length and traverses a great thickness of strata. This extensive pipe was usually vertical, and nearly uniform in diameter for great depths; when exposed by denudation, it has a circular ground plan, or if shown in vertical section (or elevation) in a cliff is a pillar-shaped mass crossing the bedding planes of the strata nearly at right angles. It terminates upwards in the remains of the volcanic cone and communicates below with the reservoir from which the lavas were emitted, represented in most cases, where it has been exposed, by a large irregular mass (a batholith or boss) of coarsely crystalline igneous rock. The site of such a neck is generally indicated by a low conical hill consisting of volcanic rock, surrounded by sedimentary or igneous strata of a different kind. The low cone is due to the greater hardness and strength of the volcanic materials and is not connected with the original shape of the volcano. Two splendid sugar-loaf cones known as the Pitons of St. Lucia in the West Indies, rising from the sea with almost vertical sides to a height of nearly 3,000ft., are old volcanic necks. In Texas, New Mexico, Arizona, California and many of the western states of North America, geologists have observed conical volcanic hills having all the features which belong to necks.

Where the volcanic rocks are soft and easily disintegrated the position of a neck may be indicated by a cup-shaped hollow; this is the case with some of the diamond-bearing basic pipes of South Africa. Examples are the Kimberley diamond mines. The blueground (or serpentine breccia) occupies great pipes or funnels, circular in outline with nearly vertical sides, extending downwards to unknown depths; these are the necks of the old volcanoes.

The size of necks varies considerably; the smallest may be only 20 or 30yd. in diameter, the largest are several miles. In this respect they resemble active craters, but no necks have been met with on the earth's surface with dimensions approaching those of the so-called "craters" of the moon.

Occasionally a whole neck is composed of solid crystalline rock representing the last part of the magma which ascended from the underground focus and congealed within the crater. In Mont Pelée, for instance, the last stage of the eruptions of 1902 to 1905 was the protrusion of a great column of solidified lava which rose at one time to a height of 900ft. above the lip of the crater, but has since crumbled down. The Castle Rock of Edinburgh is a neck occupied by a plug of crystalline basalt. Necks of this kind weather down very slowly and tend to form prominent hills.

After the eruptions terminate gases or hot solutions given out by deep-lying masses of molten rock may find a passage upward through the materials occupying the crater, greatly modifying their mineral nature and laying down fresh deposits. A good example of secondary deposits within a volcanic neck is provided by the Cripple Creek mining district of Colorado. The ore-bearing veins are connected with volcanic rocks and part of these occupy a vertical circular pipe which is a typical volcanic neck. A phonolitic breccia, greatly altered, is the principal rock, and is cut by dikes of phonolite, dolerite, etc. The country rock is mostly granite and gneiss, and blocks of these are common in the breccia. A large volcano was built up in Tertiary times on the granite plateau, and has since been almost entirely removed by denudation. The gold ores were carried upwards by currents of hot water derived from the volcanic magma and were deposited along cracks and fissures in the materials which occupied the crater, and also in the surrounding rocks (*see* VOLCANO). (J. S. F.)

NECKAM, ALEXANDER (1157–1217), English schoolman and man of science, was born at St. Albans in September 1157, on the same night as King Richard I. Neckam's mother nursed the prince with her own son, who thus became Richard's foster-brother. He was educated at St. Albans Abbey school, and became schoolmaster of Dunstable, dependent on St. Albans Abbey. Later he went to Paris, where by 1180 he had become a distinguished lecturer of the university. By 1186 he was back in England, where he again held the place of schoolmaster at Dunstable. The assertion that he was ever prior of St. Nicolas, Exeter, seems a mistake, but he was certainly much at court during some part of his life. Having become an Augustinian canon, he was appointed abbot of Cirencester in 1213. He died at Kempsey in Worcestershire in 1217, and was buried at Worcester. Besides theology he studied grammar and natural history, but his name is chiefly associated with nautical science. For in his *De naturis rerum* and *De utensilibus* (the former of which, at any rate, had become well known at the end of the 12th century, and was probably written about 1180) Neckam has preserved to us the earliest European notices of the magnet as a guide to seamen—outside China, indeed,

these seem to be the earliest notices that have survived in any country or civilization. It was probably in Paris that Neckam heard how a ship, among its other stores, must have a needle placed above a magnet (the *De utensilibus* assumes a needle mounted on a pivot), which needle would revolve until its point looked north, and thus guide sailors in murky weather or on starless nights. Neckam has no air of imparting a startling novelty: he merely records what had apparently become the regular practice of many seamen of the Catholic world.

See Thomas Wright's edition of Neckam's *De naturis rerum* and *De laudibus divinae sapientiae* in the Rolls Series (1863), and of the *De utensilibus* in his *Volume of Vocabularies*. Neckam also wrote *Corrogationes Promethei*, a scriptural commentary prefaced by a treatise on grammatical criticism; a translation of Aesop into Latin elegiacs (six fables from this version, as given in a Paris ms., are printed in Robert's *Fables inédites*); commentaries, still unprinted, on portions of Aristotle, Martianus Capella and Ovid's *Metamorphoses*, and other works. Of all these the *De nat. rer.*, a sort of manual of the scientific knowledge of the 12th century, is much the most important: the magnet passage herein is in book ii. chap. xcviii. (*De vi attractiva*), p. 183 of Wright's edition. The corresponding section in the *De utensil.*, is on p. 114 of the *Vol. of Vocabs.* Roger Bacon's reference to Neckam as a grammatical writer (*in multis vera et utilia scripsit: sed . . . inter auctores non potest . . . numerari*) may be found in Brewer's (Rolls Series) edition of Bacon's *Opera inedita*, p. 457. *See* also Thomas Wright, *Biographia Britannica literaria, Anglo-Norman Period*, pp. 449–459 (1846: some points in this are modified in the 1863 edition of *De nat. rer.*); C. Raymond Beazley, *Dawn of Modern Geography*, iii. 508–509. (C. R. B.; X.)

NECKAR, a river of Germany, 247 m. long, and a right-bank tributary of the Rhine, rises in the Hercynian gneisses of the Black forest, near Schwenningen and close to the headwaters of the Danube. It flows north and then north-east along the foot of the Jurassic scarp of the Swabian Jura, passing Rottweil, Rottenburg, and Tübingen. At Plochingen it changes its course flowing away from the scarp edge to Cannstatt near Stuttgart. The valley is very picturesque, becomes broader and deeper, is now navigable and lies between vine-clad hills being cut into the middle Trias sandstones. Continuing north past hills crowned by feudal castles, it runs by Heilbronn and Wimpfen to Eberbach. It now takes a tortuous westerly course, and the scenery on its bank becomes more romantic. Winding by Neckarsteinach and Neckargemünd between wooded heights, it sweeps beneath the Königsstuhl (1,900 ft.) washes the walls of Heidelberg, and quitting the valley enters the Rhine-trough from the right at Mannheim. (*See* RHINE.)

NECKER, JACQUES (1732–1804), French statesman, finance minister of Louis XVI., was born at Geneva in Switzerland. His father was a native of Cüstrin in Brandenburg, and became a citizen of Geneva. Jacques Necker had been sent to Paris in 1747 to become a clerk in the bank of M. Vernet. He soon afterwards established the famous bank of Thellusson and Necker. Thellusson superintended the bank in London, and Necker the Paris branch. Both became extremely rich by loans to the treasury and speculations in grain. In 1763 Necker fell in love with Madame de Verménou, the widow of a French officer. But while on a visit to Geneva, Madame de Verménou met Suzanne Curchod, the daughter of a pastor near Lausanne, to whom Gibbon had been engaged, and brought her to Paris in 1764. Necker married Suzanne before the end of the year. She encouraged her husband to make himself a public position. He accordingly became an able director of the French East India Company, and defended it against the attacks of A. Morellet in 1769. Meanwhile he had made interest with the French government by lending it money, and was appointed resident at Paris by the republic of Geneva. Madame Necker entertained the chief leaders of the political, financial and literary worlds of Paris. In 1773 Necker won the prize of the Académie Française for an *éloge* on Colbert, and in 1775 published his *Essai sur la législation et le commerce des grains*, in which he attacked the free-trade policy of Turgot. His wife believed he could get into office as a great financier, and made him transfer his share in the bank to his brother Louis.

In October 1776 Necker was made finance minister of France, with the title of director of the treasury, which he changed in 1777 to director-general of the finances. He regulated the finances by attempting to divide the taille or poll tax more equally, by abolishing the "vingtième d'industrie," and establishing *monts de piété* (establishments for loaning money on security). But his greatest financial measures were his attempt to fund the French debt and his establishment of annuities under the guarantee of the state. In the operation of funding Necker rather pointed out the line to be followed than completed the operation. He treated French finance rather as a banker than as a political economist, and thus fell far short of Turgot, the greatest economist of his day. His establishment of provincial assemblies was only a timid application of Turgot's great scheme for the administrative reorganization of France. In 1781 he published his famous *Compte rendu*, in which he drew up the balance sheet of France. His dismissal in the same year was not really due to his book, but to the influence of Marie Antoinette, whose schemes for benefiting the duc de Guines he had thwarted.

In 1787 Necker was banished by "lettre de cachet" 40 leagues from Paris for attacking Calonne. In 1788 the country, which had at the bidding of the literary guests of Madame Necker come to believe that Necker was the only minister who could "stop the deficit," as they said, demanded Necker's recall, and in September 1788 he became once more director-general of the finances. Throughout the momentous months which followed the biography of Necker is part of the history of the French Revolution (*q.v.*). Necker put a stop to the rebellion in Dauphiné by legalizing its assembly, and then arranged for the summons of the states general. Throughout the early months of 1789 he was regarded as the saviour of France, but he regarded the states general as an assembly which should grant money, not organize reforms. But as he had advised the calling of the states general, and the double representation of the third estate, and then permitted the orders to deliberate and vote in common, he was regarded as the cause of the Revolution by the court, and on July 11 was ordered to leave France at once.

Necker's dismissal brought about the taking of the Bastille, which induced the king to recall him. He was received with joy in every city he traversed, but in Paris he proved himself unequal to the crisis. After his resignation (Sept. 1790) he lived at Coppet, near Geneva. Madame Necker died in 1794, and he lived with his daughter Madame de Staël (*q.v.*), and his niece, Madame Necker de Saussure. He died in 1804.

AUTHORITIES.—*Mémoires sur la vie privée de M. Necker* (Paris and London, 1818), by his daughter, Madame de Staël-Holstein, and the *Notice sur la vie de M. Necker* (Paris, 1820), by Auguste de Staël-Holstein, his grandson, published in the collection of his works edited by the latter in 1820–1821 (Paris, 15 vols.). The bibliography of his works is as follows:—*Réponse au mémoire de M. l'Abbé Morellet* (1769); *Éloge de J. B. Colbert* (1773); *Essai sur la législation et le commerce des grains* (1775); *Compte rendu au roi* (1781); *De l'administration des finances de la France* (3 vols., 1784); *Mémoire en réponse au discours prononcé par M. de Calonne* (1787); *De l'importance des opinions religieuses* (1788); *Sur l'administration de M. Necker, par lui-même* (1791); *Du pouvoir exécutif dans les grands états* (2 vols., 1792); *Réflexions sur le procès de Louis XVI.* (1792); *De la révolution française*, several editions, the last in 4 vols. (1797), *Cours de la morale religieuse* (1800); *Dernières vues de politique et de finance* (1802); *Manuscrits de M. Necker*, published by his daughter (1804); *Suites funestes d'une seule faute*, published after his death. *See* also *Le Salon de Madame Necker*, by the Vicomte d'Haussonville (2 vols., 1882), compiled from the papers at Coppet; Ch. Gomel, *Les Causes financières de la révolution française* (1892); and for contemporary tracts and pamphlets M. Tourneux, *Bibl. de l'histoire de Paris pendant la révolution* (vol. iv., 1906), also (for the earlier ones) *Collection complète de tous les ouvrages pour et contre M. Necker, avec des notes critiques . . .* (3 vols., Utrecht, 1781); Gambier Parry, *Mme. Necker, her Family and her Friends* (1913).

NECKING, in architecture, a narrow, horizontal band around a pier, pilaster, column or similar vertical form; especially the band which circles a Doric capital below the echinus or projecting portion, and above the projecting moulding (either annulets or an astragal), which marks the junction of shaft and capital.

In nautical terminology, necking was defined in James Greenwood's *The Sailor's Sea-book . . .* (1850) as "a small neat moulding at the foot of the taffrail over the lights."

NECROPOLIS, a cemetery (*q.v.*) or burying place. Applied

to large cemeteries in or near cities, the term is also used for burial grounds near the sites of ancient civilizations. In 1850 George Grote in *A History of Greece* (1862) wrote, "Extensive catacombs yet remain to mark the length of time during which this ancient Nekropolis served its purpose."

The word means literally a "city of the dead"; it is derived from the Greek νεκρός, "corpse," and πόλις, "city."

NECROSIS is a term used in pathology to describe the death of a circumscribed area of tissue. It may result from loss of blood supply to an area, from toxic agents, from physical trauma or from the action of bacteria.

The characteristic changes of necrosis are due to the activity of intracellular enzymes and consist for the most part of a breakdown of organic material of the nucleus and cytoplasm of the cell. (F. L. A.)

NECTAR and **AMBROSIA** (*q.v.*), the nourishment of the gods in Homer and in Greek literature generally. Probably the two terms were not originally distinguished; but usually, both in Homer and in later writers, nectar is the drink and ambrosia the food. On the other hand, in Alcman nectar is the food, and in Sappho and Anaxandrides ambrosia the drink. Each is used in Homer as a fragrant unguent (as *Iliad,* xiv. 170; xix. 38).

NECTARINE, a smooth-skinned peach (*Prunus persica,* var. *nectarina*). In tree shape and leaf characters the peach and nectarine are indistinguishable, but the nectarine fruits look more like plums than peaches. There is an outgrowth of fuzz from the skin of peach varieties, while on the skin of nectarine varieties these epidermal hairs are absent. The stones and kernels of the two fruits are alike in appearance. Like peaches, nectarines have red, yellow or white flesh and have a characteristic aroma and flavour. They are adapted to the same soil and climatic conditions suitable for peaches and require the same cultural treatments for successful production. There are clingstone and freestone nectarines. Seeds of peach varieties that carry the factor for smooth skin may give rise to nectarines, while those that do not carry this factor will breed true. This fruit, which has been known for 2,000 years, is often referred to as the classical example of bud and seed variation. (F. P. C.)

NEED-FIRE or **WILD-FIRE,** a term of folk-lore to denote a superstition which survived in the Highlands of Scotland until a recent date and had its origin in the early ideas of the purifying nature of flame. The need- or wild-fire is made by the friction of one piece of wood on another, or of a rope upon a stake. It is a practice of shepherd peoples to ward off disease from their herds and flocks; it is kindled on occasions of special distress, and the cattle are driven through it. Its efficacy is believed to depend on all other fires being extinguished.

NEEDHAM, town of Norfolk county, Massachusetts, U.S.A., 12 mi. S.W. of Boston, on the Charles river, and served by the New York, New Haven and Hartford railroad. Pop. (1950) 16,262; (1940) 12,445. It is a residential suburb and has large factories making knit goods and surgical instruments. The town was set off from Dedham and incorporated in 1711.

NEEDLE. An instrument adapted for passing a thread through fabrics in sewing, consisting of a thin rod of steel, having a pointed end and pierced with a hole or "eye" to carry the thread.

The modern high quality needle is made from Sheffield crucible cast steel. The type of steel varies according to the purpose of the needle, thus hosiery needles are milder, *i.e.,* softer than sewing needles. In addition to grading the initial hardness of the steel to the particular type of needle there has also been a forward movement in the use of alloy steels for specific purposes. Thus with gramophone needles tungsten alloy steels have proved successful, and the high chromium or rustless steels have a very evident value in the case of surgical and hypodermic needles. The steel is hot rolled down into rod and the rod subsequently cold drawn into wire of the required diameter. The finished drawn wire is fed through straightening machines which also automatically cut the wire into pre-determined lengths. In hand sewing needles the length cut is always that required to form two needles. The cut lengths are packed in packets of a standard weight, according to diameter of wire, for delivery to the needle maker.

The first stage in the making of the needle is to secure absolute straightness and uniformity of physical condition. This is achieved by a method technically termed "rubbing." A number of blanks are heated to a uniform dull red heat, placed within two steel rings, and rubbed to and fro over a flat steel plate. The rotation of the wires within the containing rings results in perfect straightness and the gradual cooling from a dull red heat gives uniformity of physical condition.

The lengths are then automatically pointed by feeding from a container and being rotated over a revolving grindstone by a wheel running at right angles to the stone. The curvature of the face of the grindstone and the inclination of the traversing wheel are adjusted to the requisite contour of point. The lengths are reversed and the process repeated—thus giving a blank with two pointed ends. This automatic grinding applies to all hand sewing needles; it should be noted that machine needle points are swaged, *i.e.,* the points are formed by cold hammering between dies. The double length hand needle is fed into an automatic press which stamps the grooves at the head of each needle and in a second operation pierces the eyes of each needle and nearly separates the two. Complete separation and dressing of the head and eye are now effected mechanically.

The needle thus formed is in its soft state and as with steel cutting tools it requires hardening to bring it into service condition. Hardening is effected by quenching in oil from a red heat and in practice the operation has become nearly automatic. The hardened needles are then tempered by heating to a blue heat in order to give resilience or springiness. As with hardening, tempering in bulk is now an automatic process. The tempered needles are to some extent discoloured by the heating and the final stages are found in scouring to remove this discolouration, and polishing to obtain the silver bright finish. Scouring is effected by packing the needles in flexible containers with various mixtures all having a fine emery base and mechanically rolling the container up and down an iron roller path. Polishing is done in a similar manner with polishing reagents replacing the scouring mixtures. The polished needles are rolled down an inclined plane to bring the heads all in one direction; examined; graded, and made up into packets for sale. (P. Lo.)

NEEDLE-GUN, a military breech-loading rifle (Zündnadelgewehr), famous as the arm of the Prussians in 1866 and of the Germans in 1870–71. It was the invention of the gunsmith Johann Nicholas von Dreyse (1787–1867), who, beginning in 1824, had made many experiments, and in 1836 produced the complete needle-gun. From 1841 onwards the new arm was gradually introduced into the Prussian service, and later into the military forces of many other German states. Dreyse was ennobled in 1864. In practice the needle-gun proved to have numerous defects; its effective range was very short compared to that of the muzzle-loading rifles of the day, and conspicuously so as against the chassepot; the escape of gas at the breech was, moreover, very great. A paper cartridge was used. An improved model, giving greater muzzle velocity and increased speed in loading, was introduced later, but this was soon replaced by the Mauser rifle.

NEEDLEWORK. This subject may be considered under the two headings: (1) plain needlework, for purely utilitarian purposes; (2) art needlework, for decorative purposes. Plain needlework requires no such further explanation as may be given in the case of art needlework, under which title are included embroidery and other methods of decorative needlework, such as applied or appliqué work, ornamental quilting, patchwork and couching. In these last-mentioned methods the needlework is subservient to the decorative effect, which depends almost wholly upon the materials selected for the purpose; whereas in embroidery the needlework itself constitutes and is the visible decoration. The aim of this article is to indicate briefly different stitches of plain needlework and to show that these stitches are also used in art needlework.

The more necessary stitches in plain needlework for making clothes are tacking, running, hemming, feather-stitching or herringboning (all of which are practically of the same type), and button-holing in which the thread is looped as each stitch is

made. Button-holing is allied to another looped stitch, namely chain-stitching, which though frequently used in embroidery is rarely if ever used in plain needlework. For repairs of clothes and household linen, etc., the principal stitch is darning; grafting, however, is a substitute for it, and varies with the character of the stuff to be repaired, *e.g.*, knitted stockings, damask linen, cloth, etc. Darning is allied to running, and grafting to patchwork. Patchwork as a form of decorative needlework is exemplified in sumptuous canopies and seat covers made several centuries B.C. by Egyptians, and rich hangings made by Italian and French workers in the 16th century.

Long and short stitches, kindred in principle to the running stitch in plain needlework, are perhaps the more frequent of any stitches used in embroidery, and are especially appropriate when the blending of tints with a flat even surface is the effect to be aimed at. Much mediaeval work of this character, as well as that done with chain stitch and its allied split stitch, is regarded as typical of *opus anglicanum.* Chain stitch produces a comparatively broken surface in decided contrast with the smooth one of long and short stitch, split stitch and satin stitch embroidery. Satin stitch is well adapted to express, with even flat surface in designs for colour effects, each mass which is to be of one tint. In this respect, therefore, satin stitch serves a purpose in contrast to that of long and short stitch. A characteristic of satin-stitching is the sheeny effect produced, on both sides of the material embroidered, by parallel stitches taken closely together. Buttonhole stitch in relation to art needlework prevails to a great extent in cut linen and drawn-thread work (often called Greek lace), and predominates in the making of needlepoint lace. In much of the Persian drawn-thread work, however, it is superseded by whipping or tightly and closely twisting a thread round the undrawn threads of the linen. Whipping has been put to another use in certain 16th century art needlework for ecclesiastical purposes, where round the gold threads employed as the ground of a design coloured silks are dexterously whipped, closely and openly, producing gradations of tint suffused with a corresponding variation of golden shimmer.

Another important branch of art needlework with gold and silver threads is couching. When the metallic threads, arranged so as to lie closely together, are simply stitched flatly to the foundation material, the work is called flat couching or laying, a kind of treatment more frequent in Chinese and Japanese than in European art needlework. Flat couching is also carried out with floss silks. When a design for couching includes effects in relief, stout strings or cords as required by the design are first fastened to the foundation materials, and over them the metallic threads or in some cases coloured gimps are laid, and so stitched as to appear in miniature like varieties of willow-twisting or basket work.

Appliqué or applied work belongs as much as patchwork to the mediaeval category of *opus consutum,* or stitching stuffs together according to a decorative design, the greater part of which was cut out of material different in colour, and generally in texture, from that of the ground to which it was applied and stitched. Irish art needlework, called Carrickmacross lace, is for the most part of cambric applied or appliqué to net.

Quilting is also a branch of art needlework rather than embroidery. Indians and Persians using a short running stitch have excelled in it in past times. Some good quilting was done in England in the 18th century with chain-stitching which lay on the inner side of the stuff, the outer displaying the design in short stitches. In the account of his voyage to the East Indies, published in 1655, Edward Terry (1590–1665) writes of the Indians "making excellent quilts of satin lined with taffeta betwixt which they put cotton wool and worked them together with silk." In many of the rural sections of the United States, especially those of the South, great interest has been maintained in making patch quilts for bed covering. Quilting parties are still extant, and the different designs accumulated by the family are the source of much pride. (*See* also LACE; HOME SEWING; TEXTILES AND EMBROIDERIES.)

NEEMUCH or NIMACH, a town of Central India, with a British military cantonment, within the state of Gwalior, on the border of Rajputana. The pop. of the cantonment in 1941 was 11,119. The pop. of the town (1941) was 5,955. In 1857 it was the most southerly place to which the Mutiny extended.

The brigade of Indian troops of the Bengal army, which was stationed there, mutinied and marched to Delhi, the European officers taking refuge in the fort until relieved by the Malwa field force.

NEENAH, a city of Winnebago county, Wis., U.S., 100 mi. N.W. of Milwaukee, on Lake Winnebago at its outlet into the (canalized) Fox river. It is on state highways 114 and 150, and is served by the Chicago and North Western, the Chicago, Milwaukee, St. Paul and Pacific, and the Soo Line railways, and by bus lines. Pop. (1950) 12,418; in 1940 it was 10,645. Neenah and Menasha, across the river, are practically one community. It is the centre of a large paper industry. The city was chartered in 1873. Its name means "running water" or "rapids."

NEER, VAN DER, the name of two Dutch painters.

1. AERNOUT VAN DER NEER (1603–1677), commonly called Aert or Artus, was born at Gorkum in 1603. Houbraken states that he had been steward to a Dutch nobleman, and only took up painting seriously when he settled in Amsterdam. From 1658 to 1662 he kept a wine shop, but this venture ended in bankruptcy. Though Van der Neer seems to have made Amsterdam his home, he was evidently familiar with the canals and woods about Haarlem and Leyden and the reaches of the Maes and the Rhine. Occasionally, too, he painted in the neighbourhood of Dort, the home of Albert Cuyp, with whom he drifted into a curious partnership. Cuyp is said to have painted the foreground and cows of Van der Neer's sunset landscape in the Louvre and his signature is seen on the milkmaid's pail near the edge of the Van der Neer in the National Gallery, London. At the Staedel Institute in Frankfurt there is also a landscape in which the figures, a fisherman with a dog and a sportsman, are probably by Cuyp. Van der Neer may be said to have reached maturity with his "Moonlit landscape with a ruined castle" (1646), now in the Max Flersheim collection in Paris. His favourite subjects were the Dutch waterways at sunset; moonlight scenes; daylight icescapes with frozen water, sleighers and fishermen; and paintings of fires after dark.

2. EGLON VAN DER NEER (1634–1703), son of the above, was born at Amsterdam in 1634. He was first taught by his father and afterwards by Jacob van Loo, whom he accompanied or followed to Paris in 1663. In 1666 he went to Rotterdam, from there to Brussels and finally to Düsseldorf, where he entered the service of the elector-palatine Johann Wilhelm. Later, a portrait of the princess of Neuberg led to his appointment as painter to the king of Spain. He painted landscapes in the style of Adam Elsheimer and was one of three painters employed to put figures into the town views of Jan van der Heyden. His portraits are reminiscent of Netscher and his genre pictures come near to those of Ter Borch and Metsu in delicacy of touch. The "Lady with the Book" (1665) was sold together with the Bredel collection in 1875. A young woman in white and red satin at Rotterdam (1669) recalls Mieris, whose style also reappears in Eglon's "Cleopatra" at Buckingham Palace. Two landscapes with "Tobit and the Angel," dated 1685 and 1694, in the museums of Berlin and Amsterdam, illustrate his fashion of setting Scripture scenes in Dutch backgrounds. His most important sacred composition is the "Esther and Ahasuerus" (1696), in the Uffizi at Florence. But Eglon varied his practice also with arrangements of hunting and hawking parties, pastures and fords. The latest of his panels is a mountain landscape of 1702 in the gallery of Augsburg. He died at Düsseldorf on May 3, 1703.

(J. A. C.; X.)

NEERWINDEN, a village of Belgium in province Liége, pop. (est. 1939) 891, a few miles E. by S. of Tirlemont; gives name to two battles, the first fought in 1693 between the Anglo-Allied army under William III of England and the French under the duke of Luxemburg (*see* GRAND ALLIANCE, WAR OF THE) and

the second in 1793 between the Austrians under Prince Josias of Coburg and the French under General Dumouriez. (*See* FRENCH REVOLUTIONARY WARS: *Campaigns in the Netherlands.*)

NEES VON ESENBECK, CHRISTIAN GOTTFRIED (1776–1858), German botanist and entomologist, was born at Erbach on Feb. 14, 1776, and was educated at Darmstadt and at Jena, where he took the degree of M.D. After practising as a doctor, he was appointed professor of botany in Erlangen in 1816. Three years later he became professor of natural history in Bonn, and in 1831 he was appointed to the chair of botany in the university of Breslau. For his political activities in 1848, he was deprived of his professorship in 1851, and after spending the rest of his life in poverty, he died in Breslau on March 16, 1858.

For some years he edited the *Nova acta* of the "Acad. Leopold-Carolina," in which several of his own papers were published. His best-known works are those that deal with the *Fungi*, the *Hepaticae* and the *Glumiferae*, in all which groups he made valuable additions to knowledge.

NEGAPATAM, a seaport in the Tanjore district of Madras state, republic of India, forming one municipality with Nagore, a port 3 mi. N. at the mouth of the Vettar river. Pop. (1951) 57,854. It carries on trade with Malaya and Singapore and with other Indian ports. Peanuts, cotton goods, tobacco and vegetables are exported. Vessels lie two miles offshore. Negapatam is the terminus of a branch of the Southern railway, with railway workshops, and has two technical institutes. It is also a depot for coolie emigration. Negapatam was one of the earliest settlements of the Portuguese on the Coromandel coast. It was taken by the Dutch in 1660, becoming their chief possession in India, and by the English in 1781. From 1799 to 1845 it was the headquarters of Tanjore district.

NEGAUNEE, a city of Marquette county, Michigan, U.S., 12 mi. W. by S. of Marquette, near Lake Superior, altitude, 1,564 ft. It is on federal highway 41, and is served by the Chicago and North Western, the Duluth, South Shore and Atlantic and the Lake Superior and Ishpeming railways. Pop. (1950) 6,472; (1940) 6,813. It is one of the most important mining centres of the upper peninsula, surrounded by both deep-shaft and open-pit iron mines including the world's largest underground iron-ore mine. A monument marks the spot where iron ore was first found (1844) in the Lake Superior region. Settlement began about 1870 and the city was chartered in 1873. The name is a Chippewa word meaning "first" or "he goes before," chosen by the Pioneer Iron company as meaning "pioneer."

NEGLIGENCE, a ground of civil law liability, and in criminal law an element in several offences, the most conspicuous of which is manslaughter by negligence. In order to establish civil liability on the ground of negligence, three things must be proved —a duty to take care of, the absence of due care, and actual damage caused directly by the absence of due care. The duty may be to the public in general, on the ground that any person who does anything which may involve risk to the public is bound to take due care to avoid the risk. For instance, in the words of Lord Blackburn, "those who go personally or bring property where they know that they or it may come into collision with the persons or property of others have by law a duty cast upon them to use reasonable care and skill to avoid such a collision." Where a special duty to an individual is alleged, the duty must rest on a contract or undertaking or some similar specific ground. Thus, where a surveyor has carelessly given incorrect progress certificates, and a mortgagee who has had no contractual relation with the surveyor has advanced money on the faith of the certificate, the surveyor is not liable to the mortgagee in an action of negligence; because he owed no duty to the mortgagee to be careful. When a duty to take care is established, the degree of care required is now determined by a well-ascertained standard. This standard is the amount of care which would be exercised in the circumstances by an "average reasonable man."

Ordinarily a man is responsible only for his own negligence and for that of his servants and agents acting within the scope of their authority. For the acts or defaults of the servants of an independent contractor he is not liable. But in certain cases a stricter obligation is imposed on him by law. Thus, while the occupier of premises is under no duty whatsoever to trespassers, who must take the premises as they find them, and while he is under no duty to mere licensees other than the duty of seeing that there are no concealed dangers in the nature of traps, he is under a duty to invitees and to all persons entering as of right to see that the premises are in a reasonably safe condition so far as reasonable care and skill can make them so; and from such duties he cannot release himself by employing an independent contractor to maintain or repair the premises. The effect of this doctrine is that the occupier may be liable if it can be shown that the independent contractor or his servant has been guilty of a want of due care. A similar obligation has been enforced in the case of a wreck stranded in a navigable river, and the owner was held liable for damage caused by the carelessness of the servant of an independent contractor who had undertaken to light the wreck. So too any person who undertakes a work likely to cause danger if due care is not taken is liable for damage caused by the carelessness of the servant of an independent contractor, so long as the carelessness is not casual or collateral to the servant's employment.

In an action of negligence a familiar defense is "contributory negligence." This is a rather misleading expression. It is not a sufficient defense to show that the plaintiff was negligent, and that his negligence contributed to the harm complained of. The plaintiff's negligence will not disentitle him to recover unless it is such that without it the misfortune would not have happened, nor if the defendant might by the exercise of reasonable care on his part have avoided the consequences of the plaintiff's negligence. The shortest and plainest way of expressing this rule is, that the plaintiff's negligence is no defense unless it was the proximate or decisive cause of the injury. There was an attempt in recent times to extend this doctrine so as to make the contributory negligence of a third person a defense, in cases where the plaintiff, though not negligent himself, was travelling in a vehicle or vessel managed by the negligent third person, or was otherwise under his control. In such circumstances it was said that the plaintiff was "identified" with the third person. But the case of the "Bernina," decided in 1888, where a passenger and an engineer on board the "Bushire" were killed in a collision between the "Bernina" and the "Bushire" caused by fault in both ships, but without fault on the part of the deceased, exploded this supposed doctrine, and made it clear that the defense of contributory negligence holds good only when the defendant contends and proves that the plaintiff was injured by his own carelessness.

The American law of negligence is founded on the English common law; but the decisions in different states have occasionally contradicted English decisions, and also one another.

See T. G. Shearman, *Treatise on the Law of Negligence* (1941); S. D. Thompson, *Commentaries on Negligence*, 7 vols. (1901–07); T. Beven, *Negligence in Law* (4th ed., 1928). (A. LL. D.)

NEGOTIABLE INSTRUMENT, in law, a document or other instrument purporting to represent an obligation involving so much money, and the property in which passes, like money, by mere delivery or by endorsement and delivery. Negotiable instruments arise in either of two ways: (1) by statute, (2) by custom of merchants. The most commonly recognized negotiable instruments are bills of exchange, promissory notes, bills of lading, foreign bonds, debentures payable to bearer, and endorsed share certificates, such as are issued in Canada and the United States. Negotiable instruments constitute an exception to the general rule that a man cannot give a better title than he has himself. (*See* BILL OF EXCHANGE.)

NEGRITOS (Span. for "little Negroes"), the name originally given by the Spaniards to the aborigines of the Philippine Islands, now applied to an ancient element of the population of southeast Asia, Indonesia and probably of Oceania. They are typically of short stature, with dark skin, closely curling hair, thick but not everted lips and broad noses. Prognathism is not marked. Skulls are generally mesocephalic or brachycephalic. Body and facial hair is scanty. They have everywhere been forced into mountain or forest terrain. Though many groups practise horticulture those

least affected by surrounding peoples, such as the Andamanese and some of the Semang, live by hunting and collecting. Their typical weapon is the bow. The Andamanese represent the type in its finest form, both physically and culturally; other groups show varying degrees of mixture. These include the Aeta of the Philippines, the Semang of the Malay peninsula and probably the Tapiro, Aiome and other tribes of the central New Guinea mountains, though the latter may be the result of local specialization of the Papuan stock. There is evidence of a Negrito substratum in Assam, in Indonesia and perhaps in some larger Melanesian islands.

BY COURTESY OF THE HERLING NEW GUINEA EXPEDITION

NOGULLA NEGRITO OF NEW GUINEA WITH HIS AXE

NEGRO, the designation of the distinctly dark-skinned, as opposed to the fair, yellow and brown races of mankind (from Lat. *niger,* black). In this sense it embraces the dark races, of the intertropical and sub-tropical regions of the eastern hemisphere, from Senegambia, West Africa, to the Fijian islands in the Pacific. It is convenient, however, to refer to the dark-skinned inhabitants of this zone by the collective term of *Negroids,* and to reserve the word *Negro* for the tribes found in Africa south of the Sahara and north of a not very well-defined line running roughly from the gulf of Biafra with a south-easterly trend across the equator to the mouth of the Tana. The Bantu Negroids are south of this line. The yellowish-brown Bushman and Hottentot (*qq.v.*) peoples of South Africa possess certain Negroid characters, the tightly curled hair, the broad nose, the tendency towards prognathism; but the relation is not close. The Negroids of Africa, Melanesia and Australasia have in common a number of characteristics such as:—A dark skin, varying from dark brown, reddish-brown or chocolate to nearly black; dark tightly curled hair, flat in transverse section, of the "woolly" or the "frizzly" type; a greater or less tendency to prognathism; eyes dark brown with yellowish cornea; nose more or less broad and flat; and large teeth. The Negro hair is flat, issues from the epidermis at a right angle, is spirally twisted or crisped, has no central duct, the colouring matter being disseminated through the cortex and intermediate fibres, while the cortex itself is covered with numerous rough, pointed filaments, adhering loosely to the shaft; lastly, the Negro pile will felt, like wool, whereas true hair cannot be felted. The true Negro (western Sudan type) is of tall stature, burly, short-legged, usually long-headed, with bulging forehead. A broad headed element of obscure origin extends across the continent. (For the Negro in the United States *see* NEGRO, THE AMERICAN.)

In Africa three races have intermingled to a certain extent with the Negro; the Libyans (Berbers, *q.v.*) in the Western Sudan; and the Hamitic races (*q.v.*) and Arabs (*q.v.*) in the east. The Bantu-speaking peoples in the southern portion of the continent approach the Hamites in those characteristics in which they differ from the true Negroes, and probably have a proportion of Hamitic blood.

The colour of the skin, which is also distinguished by a velvety surface and a characteristic odour, is due to the greater abundance of the colouring matter in the mucous membrane between the inner or true skin and the epidermis. This colouring matter is not distributed equally over the body, and does not reach its fullest development until some weeks after birth. The dark colour seems to depend neither on geographical position, the isothermals of greatest heat, nor even altogether on racial purity. The extremes of the chromatic scale are found in juxtaposition throughout the whole Negro domain, in Senegambia, the Gabun, upper Nile basin, lower Congo, Shari valley, Mozambique, ranging from dusky or yellow brown to sooty black. Some of the mixed races, such as many Abyssinians, Galla, Jolof and Mandingo, are quite as black as the darkest full-blood Negro. The development of pigment in the dark-skinned races as a natural protection against the ultra-violet rays in which tropical light is so rich must be viewed as merely a part of a many sided modification of the skin under torrid conditions.

In certain of these characteristics the Negro stands on a lower evolutionary plane than the white man, and is closely related to the highest anthropoids. The characteristics are length of arm, prognathism, a heavy massive cranium with large zygomatic arches, flat nose depressed at base and the tendency of the frontal bones to fuse together and form an eminence of peculiar shape. But in respect to the character of the hair, the white man stands in closer relation to the higher apes than does the Negro.

Mental Qualities.—In reviewing the comparative studies of the differences between the Negro and the modern European, Carr-Sanders concludes that "there seems to be no marked difference in innate intellectual power. The differences are rather differences in disposition and temperament. . . . The apparent arrest of development may not be so much an inevitable result of the kind of mental faculties which are inherited as the coming into play of a peculiar tradition." (*Population Problem,* 1922, p. 397.)

It is not fair to judge of the Negro's mental capacity by tests taken directly from the environment of the white man, as for instance tests in mental arithmetic; skill in reckoning is necessary to the white race, and it has cultivated this faculty; but it is not necessary to the Negroes, who often surpass white men in acuteness of vision, hearing, sense of direction and topography. Given suitable training, the Negro is capable of becoming a craftsman of considerable skill, particularly in metal work, carpentry and carving. The bronze castings by the *cire perdue* process, and the cups and horns of ivory elaborately carved, which were produced by the natives of Guinea after their intercourse with the Portuguese of the 16th century, bear ample witness to this.

Social Conditions.—Generally speaking the Negro is first and foremost an agriculturist. Next in importance to agriculture come hunting and fishing and, locally, cattle-keeping. The last is not strictly typical of Negro culture at all; nearly all the tribes by whom it is practised are of mixed origin, except perhaps the Dinka of the upper Nile, the whole of whose existence centres round the cattle pen. The social conditions are usually primitive, especially among the Negroes proper, being based on the village community ruled by a chief. Where the country is open, or where the forest presents no great obstacle to communication, a chief has often extended his rule over several villages and has ultimately built up a kingdom administered by sub-chiefs of various grades, and has even established a court with a regular hierarchy of officials. This "empire-building" has reached its greatest proportions in the south of the forest belt in the territory of the Bantu Negroids, where arose the states of Lunda, Cazembe, etc.

The domestic life of the Negro is based upon polygyny, so vital an element of the native social system that attempts to abolish plurality of wives would result in the most serious social disorder. Descent in the Negro world is often reckoned through the female, though many tribes with a patriarchal system are found. Traces of totemism are found sporadically. Secret societies are found in their highest development among the Negroes of the west coast.

The Negro is principally a vegetarian. Meat is everywhere regarded as a great delicacy. The cattle-keeping tribes rarely slaughter for food, because cattle are a form of currency. Fish is also an important article of diet in the neighbourhood of large rivers, especially the Nile and Congo. The two cultivated plants which form the mainstay of native life, manioc in the west and centre and mealies in the south and east, are neither of African origin. Cannibalism (*q.v.*) is found in its simplest form in Africa, where the majority of cannibal tribes eat human flesh because they like it. Among the true Negroes it is confined mainly to the

Welle and Ubangi districts, though found sporadically (and due to magical motives) on the west coast, and among the Bantu Negroids in south-western Belgian Congo and the Gabun.

Religion.—In the western forests where communities are small the Negro is a fetishist, combined more or less with nature worship. Where communication is easier worship becomes more systematic, and definite supernatural agencies are recognized, presiding over definite spheres of human life. Ancestor-worship appears and often assumes paramount importance, and is typical of all the eastern and southern portions of the continent. Malignant powers receive attention from man, with a view to propitiation or coercion. Beneficent agencies require no attention, since, from their very nature, they must continue to do good. In the western culture area, among both Negro and Bantu Negroid tribes, is the belief that any form of death except by violence must be due to evil magic exercised by, or through the agency of, some human individual; to discover the guilty party the poison ordeal is freely used. Similar ordeals are used in British Central Africa to discover magicians, and the wholesale "smelling-out" of "witches," was well-known among the Zulu-Xosa tribes. Everywhere magic, both sympathetic and imitative, is practised, both by the ordinary individual and by professional magicians, and most medical treatment is based on this, although the magician is usually an herbalist of some skill. Where the rainfall is uncertain, the production of rain by magical means is one of the chief duties of the magician, a duty which becomes paramount in the eastern plains among Negroes and Bantu Negroids alike.

The Bantu Negroids all speak dialects of one tongue (*see* BANTU LANGUAGES). The Sudanic family of languages is spoken in the area recognized as the habitat of the Negro, but Hamitic speech (Nilotic group) is also used by Negroes.

See the excellent bibliography in *Africa I.* 3. p. 240 *sqq.* (1928) by Henri Labruret for the most important modern works, and A. B. Ellis, *The Tshi-speaking Peoples* (1887); *The Ewe-speaking Peoples* (1890); *The Yoruba-speaking Peoples* (1894).

NEGRO, THE AMERICAN. Negroes, numbering at mid-20th century about 15,000,000, constituted one-tenth of the population of the United States. This largest U.S. minority group has a dual basis of classification, one ethnic, the other social. Its ethnic or racial basis is the group's common descent from hundreds of thousands of Africans legally imported, mainly as slaves, between 1619 and 1808, the year of the abolition of the slave trade, and after 1808 imported clandestinely in considerable numbers until 1848, just a few years before the general emancipation in 1863. Since U.S. law and custom designated as a Negro any person with recognizable Negro blood admixture, however slight, the practical basis of the grouping became social, and usually involved varying degrees of class proscription based on the tradition of slavery and its aftermath of colour prejudice. These discriminations varied both historically and regionally, being more intense and persistent in the areas of previous mass servitude, the southern states and adjacent regions. Such circumstances generated a racial minority problem of national scope.

A New Race.—The American Negro is a new biological and cultural product. His African ancestors came from tribes as divergent as the several peoples of Europe and from a continental area as large or larger, including all of central and West Africa—the Guinea, Ivory, Slave and Gold Coasts, the area that became French West Africa, the vast stretches of the Niger valley, the Cameroons and the Congo; there were occasionally captives from the Moors and Arabs to the north, and East and South African tribes, including Hottentots and Madagascans. All these were repeatedly scrambled in the relays of transport to African slave ports, to the West Indies and again in American slave marts, sometimes deliberately with the purpose of ensuring docility and preventing revolts. This in turn forced a rapid disappearance of the original African languages and cultures and a correspondingly fast assimilation of the rudiments of the white man's civilization.

In addition to the fusing of diverse African strains, white and Indian blood was poured into the newly forming race, partly by intermarriage but more largely by casual and later systematic miscegenation. For in the heyday of plantation slavery, deliberate slave breeding for economic reasons was also heavily re-enforced by customary miscegenation. In colonial times, intermarriage between Indians and Negroes was common; anthropologists discovered considerable traces of such admixture. Samplings by Melville J. Herskovits and others indicated that direct and compounded intermixture with the various white strains of the population left less than 20% of present-day Negroes of pure or unmixed African descent. The bulk of the American Negro population thus became a mixed group of brown and brownish-yellow "mulattoes," with a sizable marginal group of quadroon and octoroon types, many of whom were not distinguishable by appearance from Caucasians. Some of these marginals actually lost their racial identity by "passing," although many who could do so refrained through a sense of group attachment and loyalty.

Under such circumstances, traditional notions of so-called racial characteristics make little sense; many observed group traits turn out to be far from generic, or explicable in terms not of heredity but of social conditioning. Even certain apparent biological traits, such as disease susceptibilities and immunities, seemed best explained by differential living conditions and environmental factors. The Negro's musicality, artistic sensitivity, predilection for emotional forms of religion, dramatic expression and mimicry and many similar culture traits stemmed from peasant tradition and conditioning and were scarce or absent in Negroes of class strata and environments removed from such folk traditions.

The characteristic result was a distinctive number of culture fusions, which, like the spirituals—Negro folk versions of Christian hymns—folk ballads and ragtime and jazz music, represented unique blends of Negro with generic American idioms and traditions. In these ways, although deprived of his original African cultural heritage, the Negro made many unique and widely accepted Afro-American contributions to American folkways and tradition, as well as later contributions, in more sophisticated versions, to American music, literature and art.

History in the United States.—Although fairly frequent participants in the earlier Portuguese and Spanish expeditions and settlements in colonial America, the first Negroes to arrive in the colonies of British America were "twenty Negars" brought to Jamestown, Va., by a Dutch man-of-war in 1619, a few months before the "Mayflower" landed at Plymouth. These and their immediate successors had the status and privileges of the indentured bond servants who first filled the colonial labour supply. Legal slavery made its appearance within 50 years of this, and the growing demand both for personal services and land cultivation led to ever-increasing importations over a period of two centuries. Thus, in colonial times Negroes came to form a large part of the population; their relative proportion in 1790 was almost one-fifth, 757,208 out of the 3,929,214 inhabitants of the U.S. This proportion steadily declined until the last quarter of the 19th century, when the relative number of the Negro population became stable at slightly less than one-tenth the total population.

In the early days slaves were used chiefly in the cultivation of tobacco, rice and indigo. Toward the end of the 18th century, when these industries were on the wane, slavery reached an unprofitable ebb period. Then suddenly large-scale cotton culture, made possible by the invention of the cotton gin in 1793, changed the whole southern economy to a boom production of this staple, thus enormously increasing the demand for slave labour to cultivate the new crop. Not only did slave importations increase, despite efforts to curb and prohibit the slave trade, but the breeding of slaves within the country became almost an industry. Negroes in the U.S. increased by 200,000 in the decade ending 1800, by 300,000 in the decade following and by more than 500,000 in the ten-year period that closed in 1830. By the middle of the 19th century, slavery had become the very foundation of the southern economy, and its extension to the west and southwest became the moot political question of the day. The personal relations which had somewhat humanized the institution in its earlier period broke down on the huge plantations, which shifted more and more to mass production by absentee landowners and were

managed and supervised by professional white overseers.

Involved in inevitable competition with the free labour economy of the north and the expanding midwest, and characterized increasingly by the abuses and cruelties of a harsh and arrogant regime, the slave economy began to draw the fire of an organized campaign of moral opposition. Abolitionist propaganda and protest, various more moderate schemes for the gradual freeing of the slaves, alternative plans for "colonization" or repatriation to Africa of freed Negroes sponsored by the American Colonization society, and finally the dramatic flight and pursuit of fugitive slaves to free territory brought the slavery controversy to a crisis in the decade 1850–60. The issue became one of the precipitating causes of the Civil War (1860–65), and resulted in the Emancipation Proclamation in 1863, by which Pres. Abraham Lincoln as a war measure freed almost 4,000,000 Negroes in bondage in the seceding states of the southern Confederacy. By that time, however, there were already about 450,000 free Negroes, mainly in the north. In 1864 enlistment in the Union army was opened to Negroes, and by the end of the war 186,000 had been enrolled, of whom 38,000 lost their lives. Of this impressive total, 93,000 came from the slave state areas, 52,000 from the free states and the balance from the border states.

The legal freedom of the Emancipation Proclamation was only a first step in the process of converting slaves into citizens. Not only did the freedmen have to struggle painfully toward real independence and some sort of educational, economic and political parity, but after the first enthusiasms of civil rights legislation guaranteeing citizenship, the franchise and equal rights, the masses in the south were subject to Reconstruction politics and southern hostility. Reactionary pressures and in some places open Ku Klux Klan terrorism slowed down the rate of educational progress and the considerable gains in self-support. Migration to the cities and to the north and midwest became increasingly the refuge of the more progressive Negroes. Later, increased reaction added the handicaps of disfranchisement by restrictive state laws on voting qualifications; without political safeguards, most constitutional rights and privileges were nullified. The peasant masses were doomed to substandard, segregated living under dominant white control, with the rural southern Negro increasingly involved in a tenant or "sharecropping" system, only a step or so removed from peonage and slavery. The younger generation in large numbers used their only available resource of mobility to migrate to towns and cities in the south for the comparative advantages of personal service and unskilled labour; then many of them began the ever-growing trek from the south to other sections of the country having more favourable educational and economic opportunities (*see* below). These trends had set in even before, but the shortages of labour during World Wars I and II speeded the movement up to the proportions of a mass exodus, with transforming cumulative effect not only on Negroes economically, educationally and culturally, but upon race relations throughout the nation, including the south.

Population.—Although its relative proportion to the general population steadily decreased after 1790, when it was almost 20%, the Negro population exhibited two basic trends: steady over-all growth and marked geographical shifts. The decline in relative numbers resulted not from a decrease in the rate of growth but from the fact that, while no significant number of Negroes came in after the slave importations ended, heavy white immigration continued until the restrictive immigration quotas of the 1920s. Starting with the first census in 1790 with 757,208 Negroes, Negro relative numbers had declined by 1860 to 14.1%, although the total number had actually increased to 4,414,830. Data for the decades 1910–50 indicated that the proportional ratio of the white and Negro populations had about reached a point of general stability at just under 10%. By 1950 the total Negro count was almost 15,000,000, or 9.9%.

More significant than the changes in numbers were the changes in population distribution. At first the Negro population was centred in the upper south, especially in tobacco-growing Virginia. This centre moved rapidly south and west into the fertile lands opening up to the mass production of cotton, rice and sugar. By the time of the outbreak of the Civil War, every state of the old south had more than 200,000 slaves; several states had almost 500,000 each—Georgia, 465,698; Alabama, 437,770; Mississippi, 437,404; and Louisiana, 357,456.

The next shift of consequence began the reverse trek of the Negro from the south to the north and west. It started with the flight of escaped slaves in the early 1800s, an exodus which increased rapidly after the "underground railroad," an abolitionist project for aiding fugitive slaves to freedom, developed an effective organization. Although there are no precise figures on the number of such refugees, the total was reliably estimated to be at least 100,000 slaves between 1810 and 1850. At its peak, the underground railroad had a network from the midsouth and borderline points as far north as Canada, with several thousand operatives.

After the Civil War and emancipation, the migration of Negroes from the south increased greatly, periodically disturbing the old south by repeated threats to its previously inexhaustible labour supply. Although generally directed northward, one of the first mass migrations was toward Kansas in the 1870s and 1880s, involving at least 100,000 migrants. Also, as cotton production steadily moved into the Mississippi delta and the western cotton lands of Texas, Negro labour moved with it. During the entire period of Reconstruction, Negro migration from Dixie continued at a slow, steady pace, until it again assumed mass proportions just before and after World War I. Agricultural depressions and the boll-weevil blight added their share of pressure until finally the expanding northern and midwestern labour market brought on a movement of tidal dimensions. It was estimated that between 1915 and 1918 at least 500,000 Negroes left the south. This trek continued with only slight abatement during the depression of the 1930s, after which World War II set off another fresh stream of migration, estimated at 1,000,000 to 1,500,000 between 1940 and 1950. In the latter displacement, large numbers also went westward to west coast industrial centres from Los Angeles, Calif., to Seattle, Wash. Cumulatively this series of shifts completely changed the sectional distribution of the Negro in the U.S. In 1860, 92.2% of the entire Negro population lived in the south; by 1900 this percentage was down to 89.7%; by 1950 it had dropped to 67.5%. While Negroes constituted 36.8% of the south's population in 1860, the proportion had fallen to 32.2% in 1900 and to 20% in 1950. By contrast, the northern Negro population had more than tripled between 1900 and 1940, growing from 880,771 to 2,790,193. Between 1940 and 1950 this shift was so accelerated that Negroes in the north increased almost 50%, from 2,790,193 to 4,109,000. At mid-20th century, more than one-third the Negro population resided in the north and the west, making up 5% and 4% of these areas, respectively.

The most significant aspect of the Negro's migration was his rapid urbanization in both the north and the south. In 1900 only 22.7% of Negroes resided in urban areas; this percentage expanded to 34% in 1920, 43.7% in 1930, 48.6% in 1940 and 61.2% in 1950. In 1910 no city in the U.S. had a Negro population of more than 100,000, but in 1920 there were 6 cities with 100,000 or more, 7 in 1930, 11 in 1940 and 16 in 1950. The great bulk of the Negro population of the north was concentrated in four metropolitan areas: New York city; Chicago, Ill.; Philadelphia, Pa.; and Detroit, Mich. Although part of a general trend, this urbanizing had special effects and significance for the Negro. Adverse effects were increased racial tensions in areas of rapid influx and serious handicaps as a result of overcrowded living in substandard, semighetto sections into which the most recent migrants moved. Undesirable housing, family, health, recreation and employment conditions often resulted. But, on the other hand, the new and generally improved economic opportunities, political privileges, better educational facilities and enlarged cultural contacts in urban areas more than offset, especially for the younger generation, the temporary hardships.

Political Status.—After federal enfranchisement in 1870 Negroes were active in Reconstruction politics, with a sizable membership in congress (26) and in all the southern state legislatures. A sharp reaction set in, however, so that within 30 years

Negroes had become disfranchised throughout the entire south by restrictive state laws on voters' qualifications. In 1944 the U.S. supreme court in *Smith* v. *Allwright* outlawed the closed white Democratic primary, the most effective of these measures. Negroes slowly regained, as registered Democratic voters, access to the ballot in all the southern states; the total number of Negro voters was estimated in 1948 as more than 750,000. In the north, the Negro, a voter of long standing, was for generations affiliated with the Republican party, partly by historical loyalty, partly through fear and resentment of the southern wing of the Democratic party. But in 1932 and 1936 the northern Negro vote turned decidedly to the support of Franklin D. Roosevelt and his New Deal program, and by ceasing to be a bloc vote greatly increased its power as virtually an independent political element. This shift, combined with enormously increased voting strength in the midwest and border states, a result of heavy migration, brought the Negro vote to the strategic position of a potential balance-of-power in national and many local urban situations. As a result, in 1950, 37 Negroes were members of 11 state legislatures and 2 Negroes were members of congress (New York and Illinois). There was also a marked increase in higher political appointments, Negroes holding three federal judgeships, positions in policy echelons of the federal government and the two political party managements, and numerous local political preferments, including several city council memberships in the south. Organized protest pressure by Negroes and liberal organizations generally also brought the legislative implementation of civil rights into the centre of national, state and local politics. Although the enactment of such re-enforcing legislation federally had been blocked in congress at mid-century, such measures were unanimously recommended by the President's Commission on Civil Rights (1948) and were enacted locally by a number of northern and midwestern states and municipalities, usually with adequate enforcement machinery. Associated with this was increasing state and local enactment of fair employment practice laws and commissions, as well as a moderately successful drive for the repeal of poll-tax restrictions.

Military Status.—About 6,000 Negro soldiers fought in the Revolutionary War, and more than twice that number in various naval and land engagements of the War of 1812. But Negroes were usually required to serve in separate contingents or in restricted status in the U.S armed forces. However, an integration experiment tried out successfully in the European theatre in 1945, with continuous pressure from Negro and liberal sources and another presidential Commission on Equalization in the Armed Forces, 1947–49, resulted in the gradual adoption of a policy of complete integration, which was climaxed in 1951 with the disbanding of the 24th infantry unit, the last remaining Negro unit of the regular army. This policy began with officer training units, spread to the air force, the induction training camps, the navy, marine corps and finally the army. It culminated a struggle begun during World War I, in which 367,000 Negroes took part, to have large-scale officer training open to Negroes; a special camp at Des Moines, Ia., which graduated 639 Negro officers, was conceded. At that time Negroes were barred from the marine corps and restricted to mess attendant and orderly service in the navy. In World War II Negroes were admitted to the marine corps in 1942 and to all ranks, including commissioned officers, in the navy. In that war 701,678 served in the army (more than 500,000 overseas), 165,000 in the navy, 5,000 in the coast guard and 17,000 in the marines; the ratio of Negro to white was about the same in the services as in the general population. (E. R. E.; A. LeR. L.)

Negro Education.—The slave south provided no facilities for educating Negroes; in fact, early legislation forbade it. Occasionally Negroes acquired literacy through beneficent private sources, and a few acquired more by migrating north or abroad. In the north a few academies under Quaker and other missionary auspices furnished standard academic training to a few fortunate Negroes.

The mass education of the Negro began with the Civil War, immediately after which army authorities and northern missionaries started programs of training not only for literacy but also for professional leaders, mainly clergymen and teachers. The foundation of the older Negro colleges, Lincoln, Fisk, Howard, etc., dates from this period. The Reconstruction governments also instituted tax-supported common-school education, one of their outstanding contributions to democratic institutions in the south. Negro legislators participated in and in many instances initiated these reforms; thus, the zealous desire of the freed Negroes for opportunities so long denied gave the south its first system of public education.

After trying originally a system open to both whites and Negroes, reactionary public opinion forced racial segregation, a dual system that at mid-20th century had been re-enforced by law in 17 southern states and the District of Columbia. Educational segregation led to increasing disparity in every phase of public education—school buildings and equipment, teacher salaries and qualifications, curriculum opportunities and requirements—as well as inequitable division of school tax appropriations. These discrepancies between the expenditures per pupil in public education varied greatly even within the south. Many private foundations, such as the General Education board, the Peabody, John F. Slater, Anna T. Jeannes, Phelps Stokes and especially the Julius Rosenwald fund, made it a special objective to stimulate improvement both in privately supported schools and various aspects of public education: school surveys, subsidies for teacher training and special programs and model school buildings. More direct legal pressure for the equalization of teacher salaries and other facilities had resulted by 1948 in reducing the average over-all differential for the south to the gap between $143.66 per white pupil and $86.16 per Negro pupil. Average salaries for Negro teachers in the south, by almost doubling between 1944 and 1948 from $895 to $1,738, reflected both the recent gains and the disparities previously tolerated. Northern states, while making no such general discrimination, nevertheless in particular localities made a practice of districting white and Negro schools separately; but by mid-century this had largely lapsed under legal and protest pressure.

Under such handicapped circumstances, the Negro's educational gains were phenomenal. Illiteracy, 85% in 1880, had been reduced to about 6% by 1950, compared with a general average of 2.7%. Negro enrolment in elementary schools in the south made only a slight increase because of heavy migration from that area; it totalled 2,026,327 in 1949. But the secondary school registration for the same area doubled from 163,185 in 1934 to 327,178 in 1949. Teacher increase was from 65,000 in 1934 to 72,803 in 1949, while, most significantly, the number of Negroes in colleges, an estimated 72,526 in 1951, had risen 28.4 times since 1900 and almost trebled the general national increase. Teachers in Negro colleges rose from 1,555 in 1900 to almost 7,000 in 1950; trends toward integration brought slightly more than 100 Negroes to general college faculty membership. Finally, largely as a result of U.S. supreme court decisions, by mid-century state land-grant colleges in at least 11 southern states had begun to open their facilities, particularly on the graduate and professional level, to Negro students from these states; cases in Missouri, Kentucky, Oklahoma, Texas, Maryland and Delaware set the precedent. Agitation continued for admission on a wider scale; most of the states where separate Negro land-grant colleges could not offer equal facilities in accordance with the supreme court rulings offered scholarship subsidies to Negro students in outside state institutions.

Cultural Advances.—Starting particularly in the 1920s, U.S. Negro talent began to win national and international recognition in artistic and cultural fields, particularly in music, poetry and art. There was also a growing interest in Negro folk materials, folklore, music and drama, as an important and distinctive phase of native U.S. culture. By mid-century, general U.S. literature had shown marked signs of a revaluation of the Negro, along with a tendency to discard the belittling traditional stereotypes previously in vogue. This tendency also gained momentum in social scholarship in general, and began to reflect itself in the more serious motion pictures.

NEGRO ECONOMIC LIFE

From the time of slavery the proportion of Negroes in the U.S. labour force was consistently higher than that of the white population, although at mid-20th century it was decreasing. As late as 1940 more than 58% of all Negroes 14 years of age and over were workers, compared with 52% of the white population of comparable age; in 1951 the figure for Negroes was 60%, for whites 56%. There was a higher rate of employment among Negroes, mainly because lower wages paid Negro men required Negro women to supplement the family income. Figures for 1950 revealed that the median money income of whites was about twice that of Negroes, being $2,700 for white males compared with $1,500 for nonwhite males (mainly Negroes) and $1,100 for white females compared with $500 for non-

white females. This discrepancy between Negro and white income caused a considerably higher percentage of Negro families to have more than one worker. In 1950, 52% of all nonwhite families (mainly Negro) had more than one earner, compared with 38% of white families. Low income was also responsible for a much higher incidence of child labour among Negroes.

Despite historic handicaps, Negro employment and professional interests came to cover a wide and expanding range of occupations by mid-century. Examination of Negro occupational distribution, however, revealed a pronounced concentration in agriculture and domestic and personal service. More than 75% of all Negro workers were in these pursuits in 1940; although a drastic decrease took place in the following ten years, about one-half of Negro workers were in similar jobs in 1950. The occupational status of Negroes showed marked change by mid-century, as they entered an increasing variety of trades and professions. Although important gains were made, the Negro was still greatly underrepresented in some professions and particularly in clerical and skilled work. While the occupational distribution of U.S. Negroes was still considerably different from that of the white population, Negroes were developing patterns of socio-economic stratification not unlike those among whites.

Agriculture.—In slavery and in freedom, Negro labour was concentrated until recently in southern agriculture. Despite tremendous migration and shifts in labour and industry, 36.1% of all gainfully employed Negroes were in agriculture in 1930; the 882,850 Negro farm operators (98.7% of them in the south) constituted 14% of all farm operators, although Negroes made up only 9.7% of the total population. During the 1930s the percentage of Negroes working in agriculture showed little change, but after 1940 there was a rapid decline.

The reasons for the Negroes' leaving the farm were many. First, they faced all the many uncertainties of agriculture generally and southern agriculture in particular, such as capital and credit problems, periodic crises caused by pests, overproduction, price changes, etc.; second, Negro farmers were confronted by special problems stemming from the race's historic position of inequality in southern society. Many obstacles were erected to discourage Negro acquisition of land; thus, while two out of five white farm workers were full or part owners in 1940, only one in eight Negroes had owner status, a differential of almost seven to one. About two-thirds of Negro, compared with one-third of white, agricultural workers were either sharecroppers or wage labourers.

Tenancy, long a crucial problem in southern agriculture, increased steadily from 1880 to 1930. In 1940 almost half of all farms were tenant-operated. More than one-third of all southern tenants and more than one-half of all Negro tenants were sharecroppers. Under this system, the landlord furnished the land, tools and seed; in return he received a share of the crop.

Mechanization, labour displacement and acreage reduction, as well as high wages in industry, speeded up the steady, long-term migratory trend. As a result, the number of Negro farm operators in the south had decreased to 680,266 in 1940 and to 665,413 in 1945. The shift from agriculture was especially rapid between 1940 and 1948; the proportion of Negroes in farm work was cut in half. During 1940–50 white farm operators declined 11.2%, while Negro operators decreased 27.7%. Farm labourers, especially Negroes, declined even more drastically; whites decreased about 14% and Negroes more than 32%. Thus, by 1950 the number of Negroes employed in agricultural industries had dropped radically to about 18%; the downward trend continued in 1951. The sharper movement of Negroes from the farm had almost removed the long-standing differential between white and Negro workers in agriculture.

The situation of Negro tenants and owners improved after 1940. Reduced pressure of racial competition resulting from migration, generally better economic conditions in the country and the benefits brought by the New Deal programs for agriculture were important factors. The decline of tenancy began about 1930 and was down to 38.7% in 1940 and 26.7% in 1950. Part of the decrease, especially between 1930 and 1940, was a result of mechanization, acreage reduction and movement down the tenure ladder to farm labourer status, but after 1940 many tenants succeeded in becoming owners.

Negroes engaged in a long, dramatic struggle to secure a firmer foothold in agriculture through land ownership, which Booker T. Washington advocated as an important avenue for entrance of the race into business. Reversing the trend of 1900–30, the number of Negro farm owners began to increase in 1930. In 1940 there were more than 173,000 Negro-owned farms in the south, with more than 10,000,000 ac. of land, valued at well over $250,000,000. By 1945 the number of Negro farm owners had risen to more than 185,000, and their land had increased by almost 1,000,000 ac. This represented a substantial achievement for a peasant people who began after slavery solely as farm labourers.

Domestic and Personal Service.—The employment of Negroes in domestic and personal service increased from 21.6% in 1910 to 28.6% in 1930. In contrast, native white workers in these classes decreased slightly from 6.7% in 1910 to 6 6% in 1930; foreign-born white workers in these categories rose from 11.8% to 12.7%. In 1940 Negro domestic and personal service workers had risen to a little over 30%. The proportion of Negro women working as domestic servants decreased considerably, while those engaged in personal services, such as beauticians, cooks, waitresses, etc., increased. Between 1940 and 1950 private household servants decreased 40.5% among whites and 18.2% among nonwhites (mainly Negroes). On the other hand, during the same period other personal service workers increased by 25.2% among whites and 41.4% among nonwhites. As new opportunities opened up for women, workers of both races left domestic service.

Industrial Workers and Artisans.—During slavery Negroes performed most of the skilled work in the south, usually dominating the handicrafts, such as cabinetmaking, blacksmithing, tailoring, shoemaking, painting, bricklaying, etc. Between 1840 and 1860 there were instances in which slaves manned cotton factories and worked in iron mines, furnaces and tobacco factories. Prior to 1865 Negro employment in the north was mainly in semiskilled and unskilled work, although white mechanics faced the competition of slaves early in the 18th century.

With the end of slavery the Negro's practical monopoly of skilled labour in the south also ended. As work lost its stigma of inferiority, Negroes felt the growing competition of whites in most areas of the labour market. Indeed, barbering, waiting, etc., formerly known as "Negro jobs," increasingly attracted large numbers of white workers. This displacement and the reluctance to accept Negroes in the mechanical industries of the south spurred Negro migration.

In the effort to gain a foothold in industry, Negroes also met many obstacles in the north. Employers there were reluctant to hire them, turning instead to white immigrant labour. European immigration was stimulated systematically, providing a huge reservoir of cheap labour. Labour unions also resisted attempts of Negroes to enter many skilled trades, some having charter restrictions against them. Such exclusion policies facilitated pitting Negro and white workers against each other; so Negroes were first brought into some industries as strikebreakers, which increased racial antipathy in the ranks of labour.

After 1935 increasing realization of the need for solidarity among workers caused organized labour to become more aware of the value of the Negro. Of particular influence in the growth of such liberalism in the labour movement was the Congress of Industrial Organizations. By organizing all workers in an industry, regardless of skill or race, it became a strong force against discrimination. Negro membership in unions rose from about 100,000 in 1930 to more than 1,250,000 in 1950.

The first opportunity for Negroes to enter northern industry in force came during World War I. The acute need for labour brought substantial numbers into many new fields, such as iron, steel, machinery, vehicle manufacturing, etc. Proving to be efficient workers, they were able for the most part to fortify their position during the 1920s. Although the rate of unemployment was higher among Negroes than among whites during the depression of the 1930s, Negro workers showed a remarkable ability to retain the gains they had won.

Pres. Franklin D. Roosevelt issued in June 1941 an executive order prohibiting discrimination in government and defense industries and establishing the Committee on Fair Employment Practice. This precedent led to the organization of many similar state and municipal commissions. Negroes in civilian jobs increased by almost 1,000,000 between 1940 and 1944, employed men rising in number from 2,900,000 to 3,200,000 and women from 1,500,000 to 2,100,000. The most outstanding change in the male Negro labour force was the shift from farm to factory, which was about 15%. The number of skilled Negro craftsmen and foremen doubled, as did the number working as operatives; *i.e.*, performing basic semiskilled factory operations. The number in both categories rose from about 500,000 to about 1,000,000 between 1940 and 1944. Similar progress was made by Negro women during this period. The number working on farms decreased about 30% while those employed as craftsmen, foremen and factory operatives almost quadrupled; proprietors, managers and officials tripled, saleswomen almost doubled and clerical workers were five times greater in number than in 1940. After World War II Negro labour maintained those gains substantially, with some advances.

The accompanying table shows the important gains in Negro employment in the U.S. between 1940 and 1950 compared with employment of white workers. In evaluating this progress, it should be kept in mind that these gains occurred in a tight labour market resulting from war and unusual peacetime economic expansion and that Negroes traditionally served as marginal workers—"the last hired and the first to be fired." Latecomers in many industries and skilled levels, they were especially affected by seniority rules. Nevertheless, the status of Negro labour was in the process of slow but progressive readjustment.

The Professions.—The position of Negroes in the professions remained different from that of Negro wage earners. While the great majority of Negro workers served in the general economy, Negro professionals were largely restricted to the racial clientele. This not only limited the opportunity for Negroes to rise in class status, but often generated vested interests in racial separatism. This paradoxical situation was improving at mid-century, not only in terms of the increasing numbers of Negro professionals but also through their greater integration into the general U.S. economy.

Negroes engaged in the professions increased from 64,648 in 1910 to 115,765 in 1930 and to approximately 125,000 in 1950; this included about 8% of the Negroes employed outside agriculture. Teachers, about 75,000 in 1949, were the largest Negro professional group; the

number on the college level rose from 1,555 in 1900 to 5,851 in 1950. A recent trend was the integration of Negro teachers into mixed collegiate faculties. Clergymen were the second largest Negro professional group. Prior to the Civil War, the church was the Negro's only free institution and, though declining in influence, was at mid-century still his principal group organization. In 1940 there were 17,487 Negro clergymen, more than two-thirds of them in the south.

Employed White and Nonwhite Persons in the United States, by Major Occupational Group, 1950 and 1940

(In thousands)

*Mainly Negro
Source U.S. Department of Commerce, Bureau of the Census, *1950 Census of Population, Preliminary Reports*, series PC-7, no. 2.

Negro physicians and dentists increased slowly, from 3,553 in 1910 to approximately 6,000 in 1950; the Negro's representation in the medical professions, however, was still proportionately less than one-fourth that of whites. Trained nurses increased from 2,433 in 1910 to more than 9,000 in 1950. In the legal profession the increase was from 798 in 1910 to 1,063 in 1940. Great strides were made in social work; while in 1930 there were fewer than 1,000 registered social workers, in 1951 there were about 5,000. During the decade 1940–50, Negroes made significant gains in many other professional and semi-professional areas, especially in technical fields and government service.

Negro Business.—Like the majority of Negro professionals, Negro businessmen at mid-century remained dependent primarily upon the Negro community; but, unlike the professionals, they had no virtual monopoly on the Negro market. Severe competition from white storekeepers diverted all but a small part of Negro purchasing power away from Negro business enterprise. Negro business also became marginal because of the marginal character of the Negro labourer on whom it depended; this combined with white competition to produce high mortality among Negro establishments. The great bulk of Negro business consisted of small retail and service enterprises such as barber shops, grocery stores, cafés, beauty parlours, cleaning and pressing shops, etc. In 1939 there were 29,827 retail stores and 27,368 service establishments owned and operated by Negroes. During the war period there was considerable expansion, resulting in an increase of nonwhite (mainly Negro) managers, officials and proprietors from 63,000 in April 1940 to 80,000 in April 1950, a gain of 27%.

Insurance.—The largest business among Negroes, insurance attained greatest self-sufficiency and independence from the white economy. Developing out of more than 100 years of religious, fraternal, sick and death benefit societies, Negro insurance firms grew steadily, holding in 1948 about one-third of the Negro life insurance. The National Negro Insurance association reported that in 1948 its 62 member companies had assets of more than $108,000,000, an annual income of more than $55,000,000 and insurance in force worth almost $1,000,000,000. In 1950 the 65 Negro insurance companies had improved their position further, with assets of $134,201,324, annual income of $88,779,016 and insurance in force worth $1,074,179,222. This represented marked progress, but, viewed in the larger context, Negro companies had only about 0.2% of the assets of all insurance companies, less than 0.5% of the total insurance in force and just over 0.5% of the total annual income.

Banks, Savings and Loan Associations.—The Negro bank symbolizes the effort of Negroes to provide the economic basis for a racial middle class within a segregated economy. The early difficulties and failures of these banks were caused in great part by the poverty and inability of the Negro economy to support such institutions. Two-thirds of the Negro banks failed during the depression of the 1930s, only nine surviving the banking holiday of 1933. Although 600 banks failed between 1933 and 1936, none were Negro; 50 banks were closed between 1940 and 1950, but none among Negroes. In 1950 the 14 Negro banks had total deposits of $29,000,000 and capital accounts of $2,728,000, in each instance gains over the previous year; gross earnings rose to $1,188,000. The total assets of 25 Negro savings and loan associations reporting in 1949 were $16,404,918, an increase of 45.3% over 1948; their volume of cash and governmental obligations was $1,774,321, up 120.8%.

NEGRO ART

Negro art, in the broader sense, may be said to include work portraying Negro life by other than Negro artists; in a narrower sense, to include all work of Negro artists. The American Negro, though possessing a strong African heritage in decorative and plastic art, was hampered in his expression in the field of the formal arts by conditions of the slave system, and the sudden displacement by Christianity of the pagan background in which the original African arts flourished. However, in favourable centres such as Philadelphia, Charleston and New Orleans craft artisans of exceptional skill in wood and ironwork flourished until the breakdown between 1840 and 1850 of craft skill by the factory system. Of these the most famous were the Negro art-smiths of New Orleans. In formal painting, the pioneer Negro artist was Edward Bannister (Providence, R.I.), a landscape painter, prize winner at the Centennial exposition at Philadelphia (1876) and founder of the Providence Art club. At the same exhibition, Edmonia Lewis, pioneer sculptor, exhibited her busts of William Story, Charles Sumner and Frederick Douglass. Other early Negro artists between 1865 and 1885 were Edward Stidham (Philadelphia), portraitist; William Dorsey (Philadelphia), landscape painter; and Robert Duncanson (Cincinnati), figure painter.

These were followed, after a dead interval, by the two Negro artists who achieved rank in U.S. painting and sculpture, Henry Ossawa Tanner (1859–1937) and Meta Warrick Fuller. Tanner's painting, mostly of biblical subjects, in addition to the romantic realism of his French masters, reflects the mysticism and religious faith of his Negro parentage and, like the work of Israels, combines utmost sophistication of technique with naïve simplicity of theme. His technical skill was attested by many prize awards and also by his inclusion in the Luxembourg, Wilstach, Pennsylvania Academy of Fine Arts, Carnegie institute, Chicago Art institute and other collections. A school of formal academic painting followed Tanner: William Harper (1874–1910), landscape painter of note; William Edouard Scott (1884–   ), portraitist and mural painter; William Farrow (1885–   ), landscapist and etcher; Charles Dawson (1889–   ), portrait painter and engraver; Edward Harleston (1890–1931), portraitist and figure painter of merit; and Laura Wheeler Waring (1887–1948), type portraitist and decorative illustrator.

In sculpture, the outstanding Negro has been Meta Warrick Fuller (1877–   ), educated at the Pennsylvania School of Industrial Art and pupil of Colarossi academy, St.-Gaudens and Rodin. She achieved recognition in the Paris salons of 1903 and 1904 with her forceful symbolic works, "Oedipus," "Secret Sorrow," "The Wretched," "The Impenitent Thief" and "John the Baptist." Later she turned to the delineation of Afro-American types with her series of 14 groups representing the history and progress of the Negro, for the Jamestown exposition (1907), and her "Ethiopia Unbound," executed for the New York Emancipation Semi-

Centennial (1913). Later still she turned to portrait sculpture and to abstract symbolic groups. In similar vein but with slightly more attention to racial types, May Howard Jackson (1878–1931) did meritorious work in sculpture. Though occasionally racial in theme and feeling, the work of the foregoing artists has been traditional in ambition, sympathy, and technique, and their success has come to them primarily as artists.

Since 1920 the younger Negro artists have broken largely with academic tradition and style, and there has emerged, along with considerable modernism, a school of Negro art more distinctive and original and devoted more consciously to racial portrayal and expression. This activity has focused mainly in a New York or Harlem group, including M. Gray Johnson (1896–1934), Palmer Hayden (landscapist), Aaron Douglas (1898–) figure painter and illustrator, Albert Smith (1896–1939), William H. Johnson (1902–), Lesesne Wells (1902–), Augusta Savage (1900–) sculptor, Richmond Barthé (1901–) sculptor; and in a Chicago group, including Archibald J. Motley (1891–), Hale Woodruff (1900–), Charles Seebree; and in the West, Sargent Johnson (1888–) sculptor. Modernist trends, together with liberal participation in the Federal art projects, have since 1935 integrated the Negro artist more closely with contemporary American art.

One trend has been toward using African motifs and symbolization of the African and West Indian backgrounds, another toward abstraction and modernistic primitivism, and later, realistic genre of the urban scene and a use of Negro life as art of social interpretation and social protest.

NEGRO DRAMA

Negro drama in the United States represents the same tendency toward the development of race or group drama as is to be found among other cultural minorities. It exemplifies the development of a group consciousness and the consequent urge for artistic expression of a people possessing a common tradition and race experience. Negro drama is likewise a recognized phase of American drama.

In the period previous to the Civil War the Negro appeared as a minor character in L. Beach's *Post Free* (1807) and in Anna Cora Mowatt's *Fashion* (1845). In the '40s the minstrel show was making its appearance. Charles Callender, Lew Dockstader and Primrose and West, in turn presented caricatures of the Negro that have persisted in the American theatre. Following the Civil War the novel by Harriet Beecher Stowe, *Uncle Tom's Cabin*, was dramatized and produced throughout the North, soon to be followed by another drama of the same type, *The Octoroon*, by Dion Boucicault. These plays accustomed the public to Negro drama designed to appeal to its sympathy rather than its ridicule. The minstrel characterization of the Negro continued until 1895, when John W. Isham organized a musical show, *The Octoroons*, the first of a long line of musical comedies which have opened the doors of opportunity to a group of notable Negro actors, including Williams and Walker, Cole and Johnson, S. H. Dudley, T. Leubie Hill, Ernest Hogan, Sissle and Blake, Miller and Lyles, Florence Mills and Adelaide Hall. These musical shows have contributed little to the direct stream of Negro drama, yet they have demonstrated the exceptional histrionic talents of the race. They may yet furnish the material for the evolution of new dramatic forms in the future. Witness the interesting experiment of Laurence Stallings and Frank Harland in the jazz opera *Deep River*, in *Show Boat*, and the folk-operas, *The Emperor Jones* and *Porgy and Bess*.

In 1910, Edward Sheldon's *The Nigger* was produced, and in 1913, the first important Negro pageant, *The Star of Ethiopia* written by W. E. B. DuBois, and in 1916, the first successful problem drama written by a Negro, *Rachel*, a three-act play by Angelina Grimke.

The first important step in the development of an authentic Negro drama was taken on April 5, 1917, when Mrs. Norman Hapgood, in association with Robert Edmond Jones, presented a group of Negro actors in three one-act plays written for the Negro theatre by the American poet, Ridgely Torrence.

In the years immediately after the World War Negro drama suddenly assumed a place of major importance in American drama. The production of Eugene O'Neill's, *The Emperor Jones* (1919), proved a landmark. Charles Gilpin, a Negro, who played the title rôle, was selected by the New York Drama League as one of the ten persons who had contributed the most to the American theatre during that year.

The Ethiopian Art theatre was organized by Raymond O'Neill in co-operation with Mrs. Sherwood Anderson, in Chicago in 1923. Its main contribution to Negro drama was the presentation of a one-act folk play, *The Chip Woman's Fortune*, written by a Negro playwright, Willis Richardson, who has contributed a number of meritorious one-act plays to Negro drama.

Supplementing these Little Theatre groups, a definite movement for the establishment of an experimental laboratory of Negro drama and for the development of a national Negro theatre was instituted in 1920 at Howard university, in Washington. The organizer of this undertaking was Montgomery Gregory, who was assisted by Alain Locke, Marie Moore Forrest, Cleon Throckmorton and the university authorities. Their leading idea was that the medium of dramatic expression offered the Negro race one of its best means both of developing its own traditions and of making a substantial contribution to American culture. The Howard Players successfully produced several one-act plays written by members of the group. Hampton, Tuskegee, Atlanta university and the Gilpin Players, Cleveland, have done effective work in educational and experimental race drama.

The Carolina Playmakers of the University of North Carolina, under Frederick Koch, have made notable contributions to Negro drama. Prof. Paul Green of this university ranks with Eugene O'Neill as the leading dramatist of Negro life. *White Dresses*, *Granny Boling*, *The No 'Count Boy* and the Pulitzer prize play, *In Abraham's Bosom*, are among his successful dramas. The awakened national interest in Negro drama chiefly occasioned by the production of *The Emperor Jones* has resulted in a succession of plays of Negro life on the New York stage. Some of these plays were: *Goat Alley* by E. Howard Culbertson, *Roseanne* by N. Stephens, *Taboo*, by Mary Hoyt Wiborg, *All God's Chillun Got Wings*, by Eugene O'Neill, *Porgy*, by Du Bose Heyward, *The Green Pastures* by Roark Bradford and Marc Connelly, *Run, Little Children* by Hall Johnson, *Stevedore* by Paul Peters and George Sklar, *Mulatto* by Langston Hughes, *Mamba's Daughters* by Du Bose Heyward. These successes have brought forward the stellar Negro acting talents of Richard B. Harrison, Paul Robeson, Rose McClendon, Abbie Mitchell, Rex Ingraham and others.

NEGRO MUSIC

Early American Negro music consists almost entirely of folk-music, the proportion written by individual composers being comparatively small. This music is of many kinds but it may be divided into two general classifications, sacred and secular. The sacred music consists of the well known spirituals, while the secular is work, play and love songs, the blues and dance music—ragtime and jazz. The great bulk consists of songs; ragtime and jazz, however, are instrumental as well as vocal.

The spirituals rank first in value and beauty. They, indeed, constitute one of the finest bodies of folk songs in the world. Just how far back the making of spirituals by the Negro in America goes cannot be exactly determined, but it is safe to say more than 150 years, since he began creating these songs shortly after his adoption of Christianity, along with the establishment of his own separate places of worship.

The spirituals are primarily a fusion of African music and Christian sentiments. They possess the fundamental characteristics of African music, its strong rhythmic quality, and show a marked similarity to African songs in verse forms and intervalic structure. However, the spirituals, upon the base of the primitive rhythms, rise a step beyond African music through a higher melodic and an added harmonic development. The spirituals remain distinctive Negro folk-songs.

The texts of the spirituals are based almost exclusively upon the Bible. The stories in the Bible gave the Negro bards great scope for the play of their imagination and are often told dramatically and in vivid and gorgeously coloured pictures

It is probable that many of these songs are irretrievably lost, for no systematic effort to record them was made before the Civil War. They were first introduced to the public of America and Europe in 1871 by the Fisk Jubilee singers. They have recently been given a new vogue on the concert stage by Harry T. Burleigh, Roland Hayes, Paul Robeson, J. Rosamond Johnson, Taylor Gordon, Marian Anderson, and other famous Negro singers.

Negro secular music, unlike the spirituals, has gone through many changes and developments. Most of the various styles of Negro secular music have successively been taken over, adapted and made national. And so it appears that as one style of the Negro's secular music became lost to him he set about creating another. Before and for a while after the Civil War the Negro made many plantation songs both of the ballad and the patter type. The plantation songs

became the mainstay of the black-face minstrel stage; they were adapted and imitated and remained popular for several decades.

In the last decade of the past century ragtime, a highly syncopated form of music, came into notice. It is fundamentally an instrumental form, and was the result of experiments by Negro players on the piano—then a new instrument to them. Words were adapted to these syncopated rhythms and gave birth to the ragtime song, which achieved great popularity in the first decade or so of the present century. The Negro dialect text of the ragtime song was ultimately discarded for straight English, and this form of Negro music took on a national character, and so remains.

About 1910 a distinctly new type, the blues, was invented in the South and rapidly spread over the country They are as truly folk-songs as the Spirituals; basic differences being that they are an expression of the individual and not of the group, and that they follow a rigid verse form and are less varied and rich than the Spirituals. This "blue" note has become one of the main elements of American popular music and has been experimented with by serious composers. (*See* BLUES.) Jazz (*q.v.*) is somewhat a combination and culmination of ragtime and the blues.

Another class of Negro folk-songs are the work-songs. These, originated by gangs of men at work, call for rhythmic motions performed in unison; the picks or the hammers rising, falling and resting in perfect rhythm with the music.

Outstanding among early Negro composers of note was James Bland (1851–1911), who wrote *Carry Me Back to Old Virginia* and *In the Evening by The Moonlight*, songs which have attained a semi-classic niche. Later Negro composers of note have achieved distinction in the fields of symphonic and chamber music, opera, and oratorio; among them: Will Marion Cook, Harry T. Burleigh, J. Rosamond Johnson, R. Nathaniel Dett, Clarence Cameron White, William L. Dawson, Florence B. Price, and William Grant Still.

NEGRO POETRY

As early as the year 1760 Jupiter Hammon, a slave belonging to a Mr. Lloyd of Queens village, Long Island, N.Y., published a poem 88 lines in length, entitled *An Evening Thought, Salvation by Christ, with Penitential Cries*. Hammon published several other poems, all of them religious. However, it is with Phillis Wheatley (*c.* 1753–84), a young slave, that American Negro poetry properly begins.

Between Phillis Wheatley and Paul Laurence Dunbar there were about 30 Negroes who published poetry, the publications ranging in size from pamphlets to books of from 100 to 300 pages. These writers must be considered more in the light of what they attempted than of what they accomplished. A number of them showed marked talent and feeling, but barely a half-dozen demonstrated more than mediocre mastery of technique. Such were George Horton (1797–1880), Frances E. Harper (1825–1911), Charles Reason (1818–98), James Madison Bell (1826–1902) and Albery Whitman (1851–1901).

Paul Laurence Dunbar (1872–1906) (*q.v.*) was the first American Negro poet to show real poetic talent. Contemporary Negro poets were: James Edwin Campbell, Daniel Webster Davis, George M. McClellan, J. Mord Allen, James D. Corrothers (1869–1917), William H. A. Moore and Joseph S. Cotter, Sr.

The decade after the death of Dunbar was fallow, but William Stanley Braithwaite (b. 1878) achieved recognition as a poet, critic and anthologist. His work, however, is not in subject-matter or form related to race. In general, his poems are mystic in tone.

Immediately after the entry of the United States into World War I (1917) there emerged a group of poets who almost completely discarded dialect and the traditional material of Negro poetry, including pathos and humour. The distinguishing notes of their poetry were disillusionment, protest and challenge. In this group were Claude McKay, Fenton Johnson, Joseph Cotter, Jr., Georgia Douglas Johnson, Roscoe Jamison, Lucien Watkins and James Weldon Johnson (1871–1938). This period of protest found its most powerful voice in Claude McKay (1890–1948).

A half-dozen years after the beginning of the period of protest, American Negro poetry began discarding propaganda for propaganda's sake, and essayed a more purely artistic use of racial art material and cultural background. Two new poets arose in this latest period. They were Countee Cullen (1903–1946) and Langston Hughes (b. 1902). Cullen was a poet of lyrical power and beauty. He wrote only in the well approved forms of literary English, but many of his best poems contain a racial note of deep poignancy. In 1925 he published his first volume, *Color;* this was followed in 1927 by *The Ballad of the Brown Girl* and *Copper Sun.* Hughes is more the folk poet in the selection of subject-matter and forms. Much of his material is taken from the humbler strata of life, and he has made effective use of the form of the Blues (see *Music,* p. 219). He is the author of *The Weary Blues* (1926) and *Fine Clothes to the Jew* (1927). In this period James Weldon Johnson published *God's Trombones—Seven Negro Sermons in Verse* (1927), founded on the oldtime Negro plantation sermons. The newer Negro poets writing distinctive verse are: Jean Toomer (1894–), Anne Spencer, Arna Bontemps, Angelina Grimke (1880–), Lewis Alexander, Jessie Fauset, Sterling Brown, Waring Cuney, and Frank M. Davis.

NEGRO FOLKLORE

The folk-lore of the Negro of the United States, for all its surface appearance of naïve simplicity, is a complex thing. Its origins are mixed, and often lost in obscurity. Some elements are clearly African in their beginnings, while others are as definitely related to the lore of the whites. The "big house" of colonial days, as well as the jungle of Africa has had its share in shaping Negro folk-lore. The transplanted race cherishes the superstitions, the ballads, the stories of both the new home and the old, and what it borrows makes its own as distinctly as what it originated.

There is a rich body of folk-tales current among the American Negroes, some of which have been preserved in print, and many of which are transmitted orally by the firesides and door-steps of the south. A still greater mass, no doubt, has been lost for lack of chroniclers and tellers. The best-known body of their published folk-tales is that collected by Joel Chandler Harris—made familiar by the name of Uncle Remus.

In his songs and stories the Negro shows his fondness for animals, his admiration for their craft, his interest in their prowess. He endows them with human attributes of thought and speech, and gives them greater cunning than natural history would authorize, often similar to the fable-forms of African sagas.

The Negro shows great variety in his songs, contrary to the popular conception that he sings only spirituals. The spirituals, which are melodious and haunting in their tunes, and which express humility and sweetness of spirit, owe something at least to the hymns and religious songs heard on the southern plantation. There are various groups of secular songs. There are numerous work songs, for the Negro, a truly rhythmic person, works better and faster when he sings at his task.

The American Negro has had his part in transmitting the traditional songs and ballads of England and Scotland, and has made them his own. There are many ballads that the Negro has made for himself, owing nothing to the whites. There are lullabies, old dance songs or "reels," children's game songs, counting songs, songs of love, of war and of other themes.

There is a mass of folk-beliefs, of superstitions, current among the southern Negroes, belief in ghosts, in witches, in the power of "voodoo" and so forth. In fact, the Negro folk-lore constitutes the largest and most varied body of lore to be found in America to-day.

HARLEM

Harlem was originally a village on Manhattan island, now the local name for that part of the borough of Manhattan, New York city, beginning at 106th street and extending north between the East and Harlem rivers and Eighth avenue. Its settlement, on the site of what is now Mount Morris park, dates from 1636. In 1658 Peter Stuyvesant named the village New Haarlem, after Haarlem, the town in Holland from which many of its inhabitants came. The old village is charmingly described by Washington Irving in his *Knickerbocker's History of New York*. Harlem retained its quiet aspect, surrounded by farms, until 1836, when daily communication by horse railroad was established with New York. Thereafter, by degrees, the village became a populous suburb and was finally transformed into a densely built residential section of the metropolis. The name now refers more specifically to the district north of 116th street, which since 1920 has become the most populous urban Negro community in the world.

The Negro Metropolis.—During World War I about 500,000 Negroes, taking advantage of the restrictions placed upon European immigration, and lured by war-time wages, turned from agricultural pursuits in the South to the highly specialized industries of the North. In New York city the migrants, uniting their fortunes with a stream of 60,000 Negroes coming from Central America and the West Indies, swept uptown and formed above 125th street a fabulous Negro city of 250,000 souls. This district does not constitute, however, the only

point of Negro mass contact on Manhattan Island. On the crest of "San Juan Hill" is a colony of 5,000 to 6,000 Negroes which in point of density and hardihood easily outstrips Harlem. Within the shadow of the old Fifty-third street elevated are remnants of a Negro settlement which antedates by at least a quarter of a century the glamorous "Mecca of the New Negro." But the concentration of the Negro population in Harlem has dwarfed the various settlements of the race in other parts of New York city. In the evolution of Negro communities in the north the dominating motive has always seemed to be economic, until Harlem arose as an exception with a mixed metropolitan population of professional, mercantile, semi-industrial and working class elements.

Economic Status.—In Harlem, unlike other Negro urban communities, there are few banks, insurance companies or large realty firms under Negro management. There is little outlet for the young Negro trained in business or finance. The highly-organized and competitive character of metropolitan business is largely responsible, but it is also true that the Harlem district has been slow in awakening to the necessity of the co-operative spirit in business. Lately, particularly since the Harlem riots of 1935, labour organization, mass pressure for increased employment, and participation in civic improvements have shown marked increase, due in part to an increase in group solidarity and in part to the added pressure of the economic depression. Harlem is still as a community, however, precariously unbalanced economically, between a top-heavy professional class and the underpaid and economically exploited masses there is very little middle-class buttressing. The majority of business enterprises in Harlem are not owned or operated by Negroes.

Cultural Ascendancy.—In spite of this curious showing, Harlem's ascendancy over the rest of the Negro communities of the country is a striking and vital one. Harlem is, to begin with, the goal of the Negro artist, poet, painter, musician or writer. Because Harlem is a part of New York it has done most to focus attention on the creative gifts of the American Negro. Likewise, because of the welter of native Negro races simmering in its orbit, it is a sort of market place for all sorts of ideas concerning Negro life, and the history and the future of the race.

NEHEMIAH, governor of Judaea under Artaxerxes (generally thought to be the first of that name, 465–424, although possibly the second, 404–359 B.C.). The book of Nehemiah forms the concluding portion of the great compilation, Chronicles–Ezra–Nehemiah. Nehemiah's own account, written after 432 in the first person, and confined to chapters i–vi, is the only authentic information which we possess in regard to his life and work. (*See* further EZRA AND NEHEMIAH, BOOKS OF; JEWS.)

NEHRU, PANDIT JAWAHARLAL (1889–), Indian national leader, born Nov. 14 in Allahabad, a son of Motilal Nehru (*q.v.*). He went in 1905 to England where he studied at Harrow and Cambridge. He became thoroughly at home in English and European civilization, writing an English style of great distinction, and conversant with the literature and history of most leading European countries. In 1912 he was called to the bar and returned to India where he joined the Indian National Congress and became active in Indian politics. Soon he was prominent as a follower of Gandhi and was for the first time arrested and sentenced to imprisonment in 1921. The vicissitudes of the Indian national struggle brought him several times into jail, and he became second in rank to Gandhi himself. He was elected for the first time in 1929 president of the Indian National Congress, an office he occupied again in 1936–37 and 1946. Though he remained always loyal to Gandhi, he did not share the latter's traditionalist, conservative and pacifist views. Deeply interested in agrarian reforms and in the improvement of the living conditions of the Indian masses, he found an enthusiastic following in the Indian youth and visited Europe, the Soviet Union and China several times. Nehru was named prime minister and minister for foreign affairs and scientific research when India became a British dominion in 1947, and he was sworn in as premier on Jan. 26, 1950, when the Republic of India was established. He wrote an autobiography which was published in England in 1936 and which became there a best-seller. A U.S. edition appeared in 1941 under the title *Toward Freedom.* While in jail he wrote letters to his daughter, published later as *Glimpses of World History* (Eng. ed. 1934, U.S. ed. 1942). His works include his addresses and articles, collected as *The Unity of India* (1942), and *The Discovery of India* (1946). (H. Ko.; X.)

NEHRU, PANDIT MOTILAL (1861–1931), Swarajist leader, a Kashmiri Brahman, was born on May 6, 1861. At the Allahabad bar he came to the front, earning a large income, and exercising hospitality and friendly intimacy with European society. He was for some years a member of the United Provinces legislative council. After World War I, through repression of disorder in the Punjab in 1919, his views changed. In 1919 he founded the *Independent*, an aggressively Nationalist paper, and accepted the presidentship of what was now the extremist Indian national congress. His support of Gandhi's campaign of non-co-operation took the form of suspension of his lucrative practice at the bar and the abandonment of luxurious western habits. At the close of 1921 he was imprisoned for six months for breaking the law against seditious assemblies. He so far modified his non-co-operation attitude as to accept election to the second legislative assembly at the close of 1923, and took his place there as leader of the Swaraj party. On the death of C. R. Das in 1925 he was elected president of the all-India Swaraj party, and under his guidance it was fused in the following year into the National Congress party. This organization promoted a boycott of the Simon commission and led in formulating under his chairmanship the All Parties Conference Report, or Nehru Report. It lays down a scheme of dominion status for India. (F. H. BR.)

NEILL, JAMES GEORGE SMITH (1810–1857), British soldier, was born near Ayr, Scotland, on May 26, 1810, and educated at Glasgow university. Entering the service of the East India company in 1827, he received his lieutenant's commission a year later. When the Indian Mutiny broke out Neill, who was in command of the 1st Madras Europeans, left Madras with his regiment at a moment's notice, and proceeded to Benares. The day after his arrival he completely and ruthlessly crushed the mutineers (June 4, 1857). He next relieved Allahabad, which became the place of concentration for Havelock's column. The two officers, through a misunderstanding in their respective instructions, disagreed, and when Havelock went on from Cawnpore (which Neill had reoccupied shortly before) he left his subordinate there to command the lines of communication.

The famous march from Cawnpore to Lucknow began on September 19; on the 21st there was a sharp fight, on the 22nd incessant rain, on the 23rd intense heat. On the 23rd the fighting opened with the assault on the Alum Bagh, Neill at the head of the leading brigade recklessly exposing himself. Next day he was again heavily engaged, and on the 25th he led the great attack on Lucknow itself. The fury of his assault carried everything before it, and his men were entering the city when a bullet killed him.

See J. W. Kaye, *Lives of Indian Officers* (1889); and J. C. Marshman, *Life of Havelock* (1867).

NEISSE, a town in the province of Prussian Silesia, Germany, at the junction of the Neisse and the Biela, 32 mi. by rail S.W. of Oppeln. Pop. (1939) 37,893. Neisse, one of the oldest towns in Silesia, is said to have been founded in the 10th century, and afterward became the capital of a principality of its own name, which was incorporated with the bishopric of Breslau about 1200. Its first walls were erected in 1350, and it was thrice besieged during the Thirty Years' War. The end of the first Silesian War left Neisse in the hands of Frederick the Great. The Roman Catholic parish church of St. James (Jakobikirche) dates mainly from the 13th century, but was finished in 1430. The chief secular buildings are the old episcopal residence, the old Rathaus (1499) and the beautiful Renaissance *Kämmerei* (exchequer) with a high gabled roof ornamented with frescoes.

NEISSE, three rivers of Germany. (1) The Glatzer Neisse, 121 mi. long, rises on the Schneeberg, at an altitude of 1,400 ft., flows north past Glatz, turns east and pierces the Eulengebirge in the Wartha pass, then continues eastward past Neisse until it joins the Oder (left) between Oppeln and Brieg. It is navigable to any appreciable extent only in the lowest 11 kilometres. (2) The Lausitzer or Görlitzer Neisse, 140 mi. long, rises near Reichenberg in Bohemia, on the south side of the Riesengebirge, flows north past Reichenberg, Görlitz, Forst and Güben, and enters the Oder above Fürstenberg. Less than 40 mi. are navigable. (3) The Wütende Neisse is a tributary of the Katzbach.

NEJD, a country of Arabia, occupying the core of that ancient land-block. The old block has been uptilted on the west, consequently Nejd tends to slope very gradually from west to east. The name itself implies an upland, and this is its distinc-

tive character as compared with the adjoining coastal districts of Hejaz and al-Hasa, representing the shelving down of the plateau on the west and east respectively.

In general elevation Nejd varies from 5,000 ft. on its western border to 2,500 in Qasim in the northeast, and somewhat less in the southeast. In the north Jabal Shammar, and in the east J. Tuwaiq and J. 'Aridh rise about 1,500 ft. above the general level, but, on the whole, Nejd may be described as an open steppe, of which the western and southern portion is desert, or at best pasture land only capable of supporting a nomad population; while in the north and east, owing to greater abundance of water, numerous fertile oases are found with a large settled population. (*See* Arabia.)

Nomadic tribes, following their flocks and herds over the steppe, have roamed over the territory from time immemorial, raiding the settled dwellers of the oasis in times of difficulty or scarcity. The four most prominent tribes of Bedouin are the Shammar, Harb, 'Utaiba and Mutair. The first-named represent that part of the great Shammar tribe which has remained in its ancestral home on the southern edge of the Nufud (the northern branch long ago emigrated to Mesopotamia); many of its members have settled down to town life, but the tribe still retains its Bedouin character. The Harb are probably the largest of the Bedouin tribes in the peninsula, and are divided into a number of sections. Their territory is the steppe between Qasim and Medina. The 'Utaiba territory extends from near Mecca along the road leading thence to Qasim. The Mutair occupy the desert from Qasim northward toward Kuwait.

Nejd became nominally a dependency of the Turkish empire in 1871, when Midhat Pasha established a small garrison in al-Hasa, and created a new civil district under the government of Basra, under the title of Nejd, with headquarters at Hufuf. Its real independence was not, however, affected, and the emirs, Mohammed Ibn-Rashid, at Ha'il, and 'Abdallah Ibn-Sa'ud, at Riyadh, ruled in western and eastern Nejd respectively, until 1892, when the former, by his victory at 'Unaiza, became amir of all Nejd. His successor, 'Abd-al-'Aziz Ibn-Rashid, was, however, unable to maintain his position, and in spite of Turkish support, sustained a severe defeat in 1905 at the hands of Ibn-Sa'ud, who thus became the dominant power in Nejd. By 1914 Ibn-Sa'ud, with his Wahhabi followers had wrested the province of Hasa from the Turks, and his power thus reached the Persian gulf. Remaining inactive during World War I, Ibn-Sa'ud in 1920 had captured and annexed Abha and other parts of 'Asir, leaving only the coastal strip. In 1921, Ha'il and the dominion of the amir of Jabal Shammar were in his possession, and by the end of 1925 he had overthrown the new Hashimite kingdom of the Hejaz. He was proclaimed at Jidda, in 1926, as king of Hejaz and sultan of Nejd. From Riyadh, Ibn-Sa'ud ruled over the new kingdom called, after 1932, Saudi Arabia, comprising Hejaz, 'Asir, Nejd and al-Hasa.

His administration is patriarchal and his law the *sharī'a*, administered by Wahhabi officials. A few simple taxes on cattle and possessions are collected. The chief administrative regions of the sultanate are Hasa; 'Aridh, with the town of Riyadh; Wadi Dawasir; Aflaj; Kharj; Sudair; Mahmal; Washm; Qasim; Jabal Shammar, with the town of Ha'il; Jauf; and numerous scattered oasis-groups, each ruled by an amir.

Of the towns, Hufuf and Riyadh have a population of about 30,000 each; Ha'il, Hauta, 'Unaiza, Buraida, Jauf, Mubarraz, Shaqra and Sakaka have populations between 10,000 and 20,000. The entire population of Nejd is estimated at 2,320,000. Besides the population of the towns mentioned above, and the nomadic tribes, there are many villages in hollows of the valleys of the tableland, wherein is concentrated the fertility and much of the population of Nejd. Gardens, houses, cultivation and villages lie hidden from view among the depths while one journeys over the dry flats, till one comes suddenly on a mass of emerald green beneath.

The products of Nejd include dates, wheat, barley, hides, wool, fruit, *samn* (clarified butter), camels, sheep, horses, etc. The export of camels to Syria and Egypt has been much reduced. Tea, coffee, sugar, rice, motor vehicles and piece-goods are imported.

NEKRASOV or **NEKRASSOV, NIKOLAI ALEXEYEVICH** (1821–1877), Russian poet, was born on Nov. 22 (O.S.) 1821, in Podolia, the son of a landowner in the government of Yaroslâv, where the boy was brought up. He studied at St. Petersburg, against the will of his father, who left him to his own resources. At the age of 19 he published a small volume of poems (*Dreams and Sounds*), most of which had appeared in periodicals, and in 1846 he bought from Pletnev the *Sovremennik,* which in his hands became from 1856 onwards the favourite organ of young radical writers. It was suppressed in 1866, but in 1868 Nekrasov acquired, with Saltykov, the *Otechestvennye Zapiski,* in which the traditions of the *Sovremennik* were maintained. He died at St. Petersburg on Dec. 27 (O.S.) 1877.

Nekrasov was a people's poet, and expressed the sorrows and sufferings of the common people in poems which made him the idol of the reformers, and the joy and humour of everyday life in admirable adaptations of folksong, and in charming poems for children. Among the most famous of his works are *The Red-Nosed Frost* (1863), depicting a heroic peasant woman, and the great satirical work *"Who can be happy and free in Russia?"* (1879, Eng. trans. J. M. Soskice, 1901.) The latter is a species of *Canterbury Tales,* though with a definite purpose running through the series. Seven peasants make their way on foot throughout Russia to solve the question of who is happy. They are told a series of tales, by typical characters, landowners, priests, peasants and others, and Nekrasov concludes on a note of hope for the future. This last canto, owing to the censorship, did not appear until 1881. His work includes love poems, elegies and narrative poems. The most recent edition of his poems was published in 2 vols. in 1919, and they have been translated into German by H. J. Köcher (2 vols. Leipzig, 1885–88). English translations of some of his poems, including *The Red-Nosed Frost,* are to be found in C. T. Wilson's *Russian Lyrics* (1887); and J. Pollen, *Rhymes from the Russian* (1891). *See* also a French translation of some of his poems *Poésies populaires,* by E. Halperine-Kaminsky and C. Morice, with a preface by E. M. Vogüé.

NEKTON, the name applied collectively to the larger, actively swimming animals of the open sea (mainly fishes), in contradistinction to the passively drifting plankton (*q.v.*), and the sedentary, bottom-living benthos (*q.v.*). (*See* Marine Biology.)

NELEUS, in Greek legend, son of Poseidon and Tyro, brother of Pelias. The two children were exposed by their mother, who afterwards married Cretheus, king of Iolcus in Thessaly. After the death of Cretheus, the boys, who had been brought up by herdsmen, quarrelled for the possession of Iolcus. Pelias expelled Neleus, who migrated to Messenia, where he became king of Pylos (Apollodorus i, 9; Diod. Sic. iv, 68) and ancestor of the Neleidae, who are historically traceable as the old ruling family in some of the Ionic states in Asia Minor, after the Dorian migration. By Chloris, daughter of Amphion, Neleus was the father of 12 sons (of whom Nestor was the most famous) and a daughter Pero; *cf.* Melampus. According to Pausanias (ii, 2. 2, v. 8. 2) Neleus restored the Olympian games and died at Corinth, where he was buried on the isthmus.

NELLORE, a town and district of India, in the Madras presidency. The town is on the right bank of the Penner river, and has a station on the East Coast railway, 109 mi. N. of Madras city. Pop. (1941) 56,315. There are Lutheran, American Baptist and Roman Catholic missions, and a college.

The District of Nellore has an area of 7,942 sq.mi. It comprises a tract of low-lying land extending from the base of the Eastern Ghats to the sea. Its general aspect is forbidding: the coast line is a fringe of blown sand through which the waves occasionally break. Farther inland the country begins to rise, but the soil is not naturally fertile, nor are means of irrigation readily at hand. About one-half of the total area is cultivated; the rest is either rocky waste or is covered with low scrub jungle. Nellore, with the other districts of the Carnatic, passed under

direct British administration in 1801. The population in 1941 was 1,617,026. The principal crops are millets, rice, and pulses. The breed of cattle is celebrated. The East Coast railway runs through the length of the district.

NELSON, HORATIO NELSON, VISCOUNT (1758–1805), duke of Bronte in Sicily, British naval hero, was born at the parsonage house of Burnham Thorpe, in Norfolk, on Sept. 29, 1758. His father, Edmund Nelson, was rector of the parish and his mother, Catherine Suckling, was a grandniece of Sir Robert Walpole (1st earl of Orford). This connection proved useless to the future admiral, who, in a letter to his brother, the Rev. William Nelson, written in 1784, speaks of the Walpoles as "the merest set of cyphers that ever existed—in public affairs I mean." His uncle, Captain Maurice Suckling later became comptroller of the navy.

Early Life.—Horatio, who had received a summary, and broken, education at Norwich, Downham and North Walsham, was entered on the "Raisonnable" when Captain Suckling was appointed to her in 1770 on an alarm of war with Spain. The dispute was settled, and Captain Suckling was transferred to the "Triumph," the guardship at Chatham, whither he took his nephew. In order that the lad might have more practice than could be obtained in a harbour ship, his uncle sent him to the West Indies in a merchant vessel, and on his return gave him constant employment in boat work on the river. In a brief sketch of his life, which he drew up in 1799, Nelson says that in this way he became a good pilot for small vessels "from Chatham to the Tower of London, down the Swin, and the North Foreland; and confident of myself among rocks and sands, which has many times since been of great comfort to me." Between April and October of 1772 he served with Captain Lutwidge in the "Carcass," in an expedition to the Arctic seas under the command of Captain Phipps (Baron Mulgrave). On his return from the north he was sent to the East Indies in the "Seahorse," in which vessel he met his lifelong friend Thomas Troubridge. At the end of two years he was invalided home. In after times he spoke of the depression under which he laboured during the return voyage, till "after a long and gloomy reverie, in which I almost wished myself overboard, a sudden glow of patriotism was kindled within me, and presented my king and my country as my patron. My mind exulted in the idea. 'Well then,' I exclaimed, 'I will be a hero, and, confiding in Providence, I will brave every danger.'" He spoke to friends of the "radiant orb" which from that hour hung ever before him, and "urged him onward to renown." On his return home he served during a short cruise in the "Worcester" frigate, passed his examination as lieutenant on April 9, 1777, and was confirmed in the rank next day. He went to the West Indies with Captain Locker in the "Lowestoft" frigate, was transferred to the flagship of Sir Peter Parker (1721–1811), and was then promoted in rapid succession to the command of the "Badger" brig, and the "Hinchinbrook" frigate. By this appointment, which he received in 1779, he was placed in the rank of post captain (from which promotion to flag rank was by seniority), at the age of twenty. In the main he owed his rapid rise to his power of winning the affection of his comrades or superiors. Parker and his wife remained his friends through life.

Active Service.—In 1780 he saw his first active service in an expedition to San Juan de Nicaragua; he was brought to death's door by fever, and invalided home once more. In 1781 he was appointed to the "Albemarle" frigate, and after some convoy service in the North Sea and the Sound was sent to Newfoundland and thence to the North American station. "Fair Canada," as he has recorded in one of his letters, gave him the good health he had so far never enjoyed. From Quebec he sailed for the West Indies where he made the personal acquaintance of Admiral Lord Hood. The admiral presented him to the duke of Clarence, afterwards King William IV., as an officer well qualified to instruct him in "naval tactics"—a marked compliment to a very young officer from one of the greatest exponents of the art. He appeared, says the Prince, "to be the merest boy of a captain I ever beheld; and his dress was worthy of attention. He had on a full-laced uniform; his lank unpowdered hair was tied in a stiff Hessian tail of an extraordinary length; the old-fashioned flaps of his waistcoat added to the general quaintness of his figure, and produced an appearance which particularly attracted my notice; for I had never seen anything like it before, nor could I imagine who he was or what he came about. My doubts were, however, removed when Lord Hood introduced me to him. There was something irresistibly pleasing in his address and conversation; and an enthusiasm, when speaking on professional subjects, that showed he was no common being." The slight oddity of appearance, the power to arouse affection, and the glow indicating the fire within, are noted by all who ever looked Nelson in the face.

The Peace of Versailles which closed the American War gave him leisure to visit France, there to study the language of his "country's enemies" and their writings on the subject of naval warfare. And now when the vast majority of naval officers were condemned to idleness on shore, he had the good fortune to be appointed to the command of the "Boreas" frigate, for service in the West Indies. Nelson signalized his arrival in the West Indies by refusing to acknowledge a half-pay officer acting as commissioner of the dockyard at Antigua as his superior. He insisted on enforcing the Navigation Laws against the Americans, who by becoming independent had become foreigners. He called the attention of the government to the corruption prevailing in the dockyard of Antigua. His line impressed the admiralty as somewhat assuming, and his strong measures against the interloping trade brought on him many lawsuits, which, though he was defended at the expense of the government, caused him much trouble for years. In the West Indies on March 12, 1787, he married Frances Nisbet (1761–1831), the widow of a doctor in Nevis, whose favour he first gained by being found romping on all fours with her little boy under the drawing-room table. The marriage was one of affection and prudence, rather than of love.

Outbreak of War.—When war broke out with revolutionary France, Nelson was appointed (Nov. 30, 1793) captain of the "Agamemnon" (64), and joined his ship on Feb. 7. From this date till June 1800, rather more than seven years, he was engaged on continual active service, with the exception of a few months when he was invalided home. This period is the most varied, the busiest, the most glorious and the most debated of a very full career. It subdivides naturally into three sections: (1) From the date of his appointment as captain of the "Agamemnon" till he was disabled by the loss of his arm in the unsuccessful attack on Santa Cruz de Tenerife on July 24, 1797, he served as captain, or commodore, under Hood, Hotham and Jervis, successive commanders-in-chief in the Mediterranean. (2) After an interval of nine months spent at home in recovering from his wound, and from the effects of a badly performed operation, he returned to the Mediterranean, and was at once sent in pursuit of the great French armament which sailed from Toulon under the command of Napoleon for the conquest of Egypt. His victory of the Nile (*q.v.*), on Aug. 1, 1798, placed him at once in the foremost rank among the warriors of a warlike time, and made him a national hero. (3) From his return to Naples after the battle of the Nile until his return to England in the summer of 1800, he was immersed in Mediterranean affairs which, owing to his own presence there, tended to centre round the shores of Naples and Sicily.

The Mediterranean.—The first of these three passages in his life is full of events which must, however, be told briefly. In May he sailed for the Mediterranean with Hood, and was engaged under his orders in the occupation of Toulon by the allied British and Spanish forces. In August 1793 he was despatched to Naples to convoy the troops which the Neapolitan government had undertaken to contribute towards the garrison of Toulon. It was on this occasion that he made the acquaintance of Emma Hamilton (*q.v.*), the wife of Sir William Hamilton, minister at the Court of Naples. References to Lady Hamilton begin to appear in his letters to his wife, but, as might be expected, they indicate little beyond respectful admiration, and he makes a good deal of her kindness to his stepson, Josiah Nisbet, whom he had taken to sea. After the allies had been driven from Toulon by

Napoleon, Nelson was employed throughout 1794 in the operations connected with the occupation of Corsica. In April and May he was engaged in the capture of Bastia, and June and July in the taking of Calvi. During the operations at Calvi, Nelson received a wound in his right eye which healed without leaving disfigurement, though the sight gradually faded. From the date of the occupation of Corsica till the island was evacuated (1794–96) he was incessantly active. He served under Hotham, who succeeded Hood in the command, and was engaged in the indecisive actions fought by him in the Gulf of Lyons in March and July 1795. The complacency of the new admiral fretted the eager spirit of Nelson, who declared that, for his part, he would never think that the British fleet had done very well if a single ship of the enemy got off while there was a possibility of taking her. Happily he was detached to the Riviera of Genoa, where, first as captain, and then as commodore, he had an opportunity to prove his qualities for independent command by harassing the communications of the French, and co-operating with the Austrians. In Sir John Jervis, who superseded Hotham, he found a leader after his own heart. When Spain, after first making peace with France at Basel, declared war on England, and the fleet under Jervis withdrew from the Mediterranean, Nelson was despatched to Elba on a hazardous mission to bring off the small garrison and the naval stores. He sailed in the "Minerve" frigate, having another with him. After a smart action with two Spanish frigates which he took off Carthagena on Dec. 20, and a narrow escape from a squadron of Spanish line of battle ships, he fulfilled his mission, and rejoined the flag of Jervis on the eve of the great battle (Feb. 14, 1797) off Cape St. Vincent. (*See* St. Vincent, Battle of.) The judgment, independence and promptitude he showed in this famous engagement revealed him to the nation as one of the heroes of the navy. Nelson receiving the swords of the Spanish officers on the deck of the "San Josef" became at once a popular figure.

Blockade of Cadiz.—A few days after the victory he became rear-admiral by seniority, but continued with Jervis, who was made a peer under the title of Earl St. Vincent. Nelson's own services were recognized by the K.B. During the trying months in which discontent in the fleet was developing toward the mutinies at Spithead and the Nore, he remained with the flag, and in the blockade of Cadiz. In July 1797 he was sent to Santa Cruz de Tenerife and made a desperate attempt to capture the place. The enterprise was, in fact, rash in the last degree, for the soldiers from the garrisons of Elba and Corsica having gone home, no troops were available for the service, and a fortified town was to be taken by man-of-war boats alone. The Spaniards were on the alert, and the attack, made with the utmost daring on the night of July 24, was repulsed with heavy loss. Some of the boats missed the mole in the dark and were stove in by the surf, others which found the mole were shattered by the fire of the Spaniards. Nelson's right elbow was shot through, and he fell back into the boat from which he was directing the attack. The amputation of his arm was badly performed in the hurry and the dark. He was invalided home, and spent months of extreme pain in London and at Bath. On April 10, 1798, he came back to the fleet off Cadiz as rear-admiral, with his flag in the "Vanguard" (74).

He was now one of the most distinguished officers in the navy. Within the next six months he was to raise himself far above the heads of all his contemporaries. A great armament was preparing at Toulon for some unknown destination. To discover its purpose, and to defeat it, the British government resolved to send their naval forces again into the Mediterranean, and Nelson was chosen for the command not only by Jervis, with whom the immediate decision lay, but also by ministers.

Command in the Mediterranean.—Having joined the flag of Lord St. Vincent outside of the straits of Gibraltar on April 30, Nelson was detached on May 2 into the Mediterranean, with three line-of-battle ships and five frigates, to discover the aim of the Toulon armament. Napoleon had, however, enforced rigid secrecy, and beyond the fact that a powerful combined force was collected in the French port he could learn nothing. On May 20 the "Vanguard" was dismasted in a gale. "I ought not," wrote Nelson, "to call what has happened by the cold name of accident; but I believe firmly that it was the Almighty's goodness to check my consummate vanity." The "Vanguard" was saved from going on shore by the skill of Captain Ball of the "Alexander," for whom Nelson had henceforth a peculiar regard. The "Vanguard" was refitted under cover of the little island of San Pietri off Sardinia. In the meantime the frigates attached to his command had returned to Gibraltar, in the erroneous belief that the liners would be taken there to make good the damage suffered in the gale. "I thought Hope would have known me better," said Nelson. On April 30 he was off Toulon again, only to find that the French were gone. Deprived of his best means of obtaining information by the disappearance of his frigates, he remained cruising till he was joined, on June 7, by Troubridge with ten sail of the line. And now he started on his fierce pursuit of the enemy, seeking him in the dark, for there were no scouts at hand; exasperated at being left without the eyes of his fleet; knowing that St. Vincent would be blamed for choosing so young an admiral; but resolved to follow the enemy to the antipodes if necessary. From Sardinia to Naples, from Naples to Messina, from Messina to Alexandria, from Alexandria, where he found the roadstead empty, back to Sicily, and then when at last a ray of light came to him, back to Alexandria—he swept the central and eastern Mediterranean. Unlike most admirals of his time, he freely discussed his plans with his captains. He had his reward in their devotion and perfect comprehension of what he wished them to do. At the same time he acquired an absolute confidence in the efficiency of his squadron, the magnificent force which had been formed by years of successful war, and by the careful training of his predecessors. The captains were the band of brothers he himself had made them.

The great victory of Aug. 1, 1798 (*see* Nile, Battle of), brought Nelson yet another wound. He was struck on the forehead by a langridge shot, and had for a time to go below. For this victory he was made a baron.

Blockade of Naples.—After providing for the blockade of what remained of the French in Alexandria, Nelson set sail for Naples and arrived there on September 22nd. Pitt's Second Coalition against France was then on the point of completion, and Naples, naturally enough in view of the French behaviour on her borders, was preparing to side with Austria and Russia in the defence of monarchy; indeed she was already organising an army under the direction of the Austrian general, Mack, but no decision as to how the troops should be used had as yet been arrived at. Nelson immediately tried to enliven the proceedings and suggested what should have been a perfectly feasible plan, by which the Neapolitan Army was to advance northwards against the French front, while the fleet was to capture Leghorn, thus cutting the French communications. Leghorn was duly taken, but the army showed little aptitude for fighting, soon becoming a mere disorderly rout, pursued by the French. This had the effect of rousing all the Jacobins in the country which was soon in such an uproar that the royal family found it necessary to retreat to Palermo—an evacuation carried out of course by Nelson and his ships, with the valuable co-operation of Lady Hamilton (*q.v.*), wife of the British Ambassador. From Palermo, Nelson kept up a double blockade—one squadron under Captain Ball was detached to force Malta to capitulate, and another, under Captain Troubridge, was sent to the Bay of Naples to operate against the Neapolitan Jacobins.

The King and Queen, however, found this method of blockade too slow, and determined to appeal to the conservative instincts of many of their subjects, who had lazily acquiesced in the Jacobin coup d'état, through the agency of an eminent ecclesiastic—Cardinal Ruffo. His Eminence landed in Italy, and his appeal for an "Army of the faith" was soon answered by thousands flocking to his banner, and he was even joined by a detachment of Russians and Turks. While these events were taking place, a French fleet of 26 vessels, under Admiral Bruix, set out from Brest and was joined by 17 Spanish warships at Cartagena. Such a force constituted a threat to Nelson who called up his ships

PORTRAITS OF LORD NELSON AND SCENES RELATING TO HIS LIFE

1. "Lord Nelson in the cabin of the 'Victory'," after a painting by C. Lucy
2. Admiral Lord Nelson, after the portrait by L. F. Abbott
3. "Lord Nelson being carried below in the 'Victory' after being fatally wounded at the Battle of Trafalgar, Oct. 21, 1805." Engraved by James Walker after a painting by J. A. Atkinson
4. The Nelson monument, Trafalgar Square, London. This monument, consisting of a granite column 170 ft. 2 in. high surmounted by a statue of Nelson, was completed in 1844 and stands in the southern side of the square, which is named in commemoration of the admiral's last victory. On the base are represented four battle scenes in bronze, cast from the metal of captured French cannon
5. The "Victory," Nelson's flagship at Trafalgar, which underwent a complete restoration, completed in 1928
6. "Rear Admiral Sir Horatio Nelson." Engraved in 1798 by W. Barnard after a painting by L. F. Abbott
7. "Destruction of the French and Spanish prizes after the victory of Trafalgar." Engraved in 1806 by L. Hall after a painting by J. T. Serres
8. The rectory at Burnham Thorpe, Norfolk, where Nelson was born Sept. 29, 1758. The building was pulled down in 1802
9. "Representation of the Memorable Battle of Trafalgar," an engraving by Jos. Jeakes after a contemporary painting, showing the British fleet engaging the combined fleets of France and Spain. The flagship "Victory" is second from the right

from Malta and Naples and prepared for resistance. He managed, however,—and this was important in view of Ruffo's successful beginning—to maintain the blockade of the latter by means of a squadron of small ships placed under Captain Foote of the frigate "Seahorse."

The Franco-Spanish threat proved an idle one and the allied fleet soon retired, but, in the meanwhile, Ruffo was driving all before him and finally shut up the French in the Castle of St. Elmo, in the city of Naples, and the native insurgents in the sea-washed castles of Uovo and Nuovo. From this commanding position he began to parley with the enemy, and the king, hearing of this, and nervous of what the Cardinal might do—he had not been empowered to make terms of peace—asked Nelson to proceed to Naples and take matters into his hands.

Ruffo's Treaty of Peace.—Nelson sailed for Naples, with Sir William and Lady Hamilton on board, on June 21st, and arrived there on the 24th to find the white flag flying from the castles and from his own flotilla. Supposing this to indicate an armistice, he at once made signal for the resumption of hostilities, only shortly to be informed by Captain Foote that matters had gone further and that a treaty of peace had been signed by which the native insurgents were to be allowed to leave their strongholds with all the honours of war, and were to be carried by ship to countries that would be glad to receive them. In making such a treaty there can be no doubt that Ruffo had greatly exceeded his instructions, though it is probable that he was actuated by motives of humanity since his control over his bloodthirsty army was incomplete. Nelson refused to listen to Ruffo's arguments or to admit the validity of his undertakings. Furthermore, he argued, there was no need for the insurgents, if they unconditionally surrendered as he proposed to make them, to trust themselves to the mob on shore, since they could be accommodated in boats without being taken to friendly countries. He agreed to let the armistice run its course, but let it be known that at the end of it he would expect unconditional surrender. This he received, and the rebels were placed in boats. One, Carraciolo, reached the hills, only to be caught at last and brought to Ruffo who, in his turn, because Carraciolo was a naval officer, handed him over to Nelson in his capacity as Commander-in-Chief of the Neapolitan fleet. Nelson at once convened a court martial of Neapolitan officers to try the rebel. The Court sentenced him to death by a majority vote, and this sentence was duly carried out.

For refusing to carry into effect Ruffo's peace terms and for not interfering to prevent the execution of Carraciolo, Nelson has been violently, and at times virulently, attacked, but it cannot be said that his traducers had ever succeeded in making out a very strong case against him. The whole matter is too involved to be fully discussed here; the conclusions which have been reached by scholars on either side have almost invariably reflected the political *parti pris* of the writers.

The whole question of Nelson's conduct at Naples is of course bound up with his friendship with Lady Hamilton. No one denies that it was now that Nelson's friendship for this woman ripened into the intimacy that was eventually to separate him from his wife. But that a private attachment, culpable as it may have been, warped his judgment in public matters no one has yet shown, nor has anyone explained why it should.

Return to England.—These events were shortly followed by the reduction of the French and by the restoration of the Neapolitan royal family in July, while in the same month Nelson laid himself open to a sharp rebuke from the Admiralty for disobeying the orders of Lord Keith who had been appointed to succeed Lord St. Vincent in the Mediterranean command. Keith, puzzled as to the objective of a combined Franco-Spanish fleet, decided that Minorca was in danger, and ordered Nelson to its defence. Nelson decided that it was not in danger and did not go. His judgment was correct, but his disobedience was inexcusable. On Jan. 20th, 1800, having in the meantime been created Duke of Bronté by the King of Naples, Nelson joined Keith at Leghorn to take part in an attempt on Corsica, during which he captured "Le Généreux" which had escaped him at the Nile. Shortly afterwards he obtained leave to go home and, not being spared a battleship, he travelled overland with Sir William and Lady Hamilton, being greatly fêted on the way. He landed in England in November.

Battle of Copenhagen.—His leave, though it was long enough to promote the final separation between him and his wife, was short. He became Vice-Admiral on Jan. 1, 1801, and soon after was offered the post of second-in-command to Sir Hyde Parker in the fleet which was to break up the armed neutrality of the northern powers. It is difficult to see why such a brilliant man was subordinated to one of such ordinary gifts as Parker, who appears at the beginning to have been suspicious of the abilities of his second-in-command. Nelson, however, choked down his natural disgust, and treated Parker with such tact that the Admiral's hostility soon melted into something approaching friendship. Indeed Nelson had his Commander-in-Chief to some extent under his thumb by the time they reached Copenhagen, and so was permitted, with rather more than half the fleet, to carry out his famous attack on the city and its defences that resulted in the battle of Copenhagen (*q.v.*). This battle showed up strongly Nelson's ability to hit upon the weak point in a defensive scheme, and is famous also for his action in putting his telescope to his blind eye when, in the middle of the fight, his attention was directed to Parker's signal ordering his withdrawal, and declaring he could not see it. It was an order that could not be obeyed without serious consequences to the fleet. In May, Parker was recalled and Nelson assumed the command, but the armed neutrality was dissolved and this left him with little to do. His health, too, was bad and in June he came home, his services being recognised by the bestowal of the title of Viscount. In the interval, before the Peace of Amiens, he was in command of a flotilla of small ships that were to combat Napoleon's threat of invasion. More in the hope of satisfying public opinion than for any other reason, an attack was launched on Boulogne with the object of destroying the flat-bottomed boats situated there. The port, however, was too strongly defended even for a Nelson.

During the short period of the Peace of Amiens (1802–3), Nelson, in company with Sir William and Lady Hamilton, lived at his house and estate that he had purchased at Merton in Surrey. Here he passed his days in quiet country pursuits, and his happiness was added to by a reconciliation with his father who had at first found it impossible to overlook his son's association with Lady Hamilton. This, probably the happiest period of his life, was all too short. War reopened in May, and Nelson was at once selected for the Mediterranean Command.

The Mediterranean Command, 1803.—He arrived off Toulon in July 1803, and instituted a strict blockade of that port. The French under Latouche-Tréville continually tried to lure him into indecisive actions in which, by damaging some of his ships, they might force him to withdraw, but Nelson consistently refused such offers and the French Admiral, writing to Napoleon, stated that he had offered battle but the English had withdrawn. Nelson declared that if he captured Tréville he would make him eat the letter, but he never had the chance to fulfil his boast, even figuratively, for Tréville died and was succeeded by Villeneuve. In the spring of 1805 the French eluded the blockade and made for the West Indies. This move was part of a large scheme directed towards the invasion of England and its details are too numerous for discussion. The series of naval movements arising from it are known as the Trafalgar Campaign, and the whole matter will be found fully dealt with under NAPOLEONIC CAMPAIGNS. Nelson, after searching the Mediterranean, decided, more by intuition than anything else, that Villeneuve had gone to the West Indies, and thither he followed him. On hearing of his enemy's arrival, Villeneuve returned precipitately to Europe, again pursued by Nelson, and got into Ferrol and then into Cadiz where he was blockaded by Collingwood, Nelson having meanwhile gone home on leave to enjoy again the rural delights of Merton. His enjoyment was indeed brief. No sooner had the news reached England that the allied fleet was in Cadiz than, with the approval and encouragement of Lady Hamilton, he offered his services, "to give M. Villeneuve a drubbing." They were immediately accepted, and he left Merton for the last time

on Sept. 13th and on the 29th was off to Cadiz.

Trafalgar.—The victory of Trafalgar (*q.v.*) which followed on Oct. 21 set the seal on his fame. Tactically it was a masterpiece and his famous signal "England expects that every man will do his duty," made as the fleet moved into battle, together with his death in the moment of victory, added, and still add, to its lustre. The "Victory," after passing through the French line, was engaged with the "Bucentaure" and the "Redoutable," and Nelson, as he walked up and down his quarter-deck with his flag-captain, Thomas Hardy, was struck by a bullet from a sharpshooter firing from the top of the last-named ship. His spine was broken, and he was carried below to the cockpit, suffering great pain. Here, amidst the din and racket of battle and the groans of the injured and dying, he lingered for a few hours. To the last he retained his interest in the battle and Hardy came to him from time to time to tell him of its progress. As his sight grew dimmer and he felt the end approaching he asked Hardy to kiss him. "Now I am satisfied," he said, "Thank God I have done my duty." "These words," says Southey in his moving account, "he repeatedly pronounced and they were the last he uttered." His body was brought home and laid in state in the Painted Hall at Greenwich Hospital, and was buried in St. Paul's.

So died the most famous of English seamen, and, indeed, the most famous of all seamen. He was more than merely a tactically and strategically brilliant Commander; he was a true leader of men—and men of all types, for the common seamen trusted and venerated him as much as did his officers. These latter were, in their turn, trusted by him and were ever in his confidence—his "band of brothers" he called them. No officer under Nelson could ever complain that he went into action not knowing his Commander's plans and intentions—and it is as much to this as to his tactical ability that his successes were due. The common seamen he always treated with humanity and kindness and these qualities were extended to his junior officers whom, remembering his own misery during his first days at sea, he was ever willing to encourage. On the other side it has been said that he was vain, liked flattery, and was an egotist. This is merely to say that he had the common faults of genius.

Nelson had no children by his wife. In November 1805, in recognition of Nelson's great services to his country, his brother William (1757–1835) was created Earl Nelson of Trafalgar.

BIBLIOGRAPHY.—Southey's *Life of Nelson* edited by Professor Geoffrey Callender (1922). C. E. Forester, *Lord Nelson* (1929). (D.H.; X.)

NELSON, a city in British Columbia, situated at the head of navigation on the west arm of Kootenay lake. Pop. (1951) 6,634. It is the commercial and administrative centre of a mining, lumbering, fruit-growing district and is the headquarters of the Kootenay division of the Canadian Pacific. It is also a station on the Great Northern railway. Chief manufactures include match blocks, wire, veneers, jams, doors, beer, machinery.

NELSON, a municipal borough in the Nelson and Colne parliamentary borough, Lancashire, Eng., 32½ mi. N. from Manchester by the London Midland Region railway. Pop. (1951) 34,368. Area 5.4 sq.mi. Of modern growth, it possesses a town hall, market hall, free library, technical school, park and recreation ground. The transport services are controlled by a committee including Burnley and Colne. Nelson's chief products are cotton and synthetic fibres. It was incorporated in 1890.

NELSON, a seaport of New Zealand, the seat of a bishop and capital of a provincial district of the same name; at the head of Tasman bay on the northern coast of the South Island. Pop. (1945 census) 13,030 (16,577 with suburbs). It has a mild climate. The town and the district surrounding are famous for apple orchards; and hops are extensively cultivated. Christ Church cathedral is finely placed on a mound which was originally intended as a place of refuge from hostile natives. The harbour is protected by the long and remarkable Boulder Bank, whose southern portion forms the natural breakwater to that anchorage. The chief industries are meat- and fruit-preserving and timber milling. Nelson is connected by rail with Blenheim and Christchurch, and by steamer and air service with Wellington. The settlement was established by the New Zealand company in 1841.

NELSON, a river of Keewatin district, Canada, discharging the waters of Lake Winnipeg in a northeasterly direction into Hudson bay. It drains an area of 360,000 sq.mi. and, including its tributary the Saskatchewan, is 1,600 mi. long. It is navigable for small steamers for a distance of about 80 mi., after which it is unnavigable except for canoes. It has a total fall between the lake and sea of 710 ft. Here its chief tributary is the Burntwood. Norway house at its source and York factory at its mouth are important stations of the Hudson's Bay company.

NELSON, a hold in wrestling. *See* WRESTLING.

NELSONVILLE, a city of Athens county, Ohio, U.S.A., 62 mi. S.E. of Columbus, on the Hocking river and the Chesapeake and Ohio railway. Pop. (1950) 4,845; and (1940) 5,368. It is an important coal-mining centre, and makes brick and tile from the clay which abounds in the vicinity. The city was founded in 1818 and incorporated in 1838. It was named after Elisha Nelson, who built the first house.

NEMATHELMINTHES, a term employed in zoology to denote a phylum of animals comprising the round-worms (Nematoda, *q.v.*) hook-worms (Acanthocephala), Nematomorpha (*q.v.*), to which are sometimes added the arrow-worms (Chaetognatha, *q.v.*), and various other groups of minor importance and doubtful affinities. Nemathelminthes is probably, even in its most restricted sense, an artificial group.

NEMATODA, a group of unsegmented roundworms ("threadworms") formerly placed with the Acanthocephala and Nematomorpha (*qq. v.*) in a phylum Nemathelminthes, now ranked as a distinct phylum related more closely to the Rotatoria and Gastrotricha. Nematodes vary in size from one-fourth of a millimetre to a metre in length. Free-living soil and aquatic species are mostly small (not more than 5 mm. long), while species parasitic in animals tend to be larger. Microscopic species are commonly called "eelworms," this terminology being highly descriptive of the general body form and mode of locomotion.

Nematodes are of practically universal occurrence; nearly every sample of soil or natural water, nearly every plant and nearly every animal has its nematode inhabitants. Thousands of species in the oceans, streams, woods and cultivated fields are harmless saprophytes, or prey upon other microscopic soil fauna. However, a few hundred species have become widely known because of intimate association with man or his domestic animals and plants. The vinegar eel, *Turbatrix aceti,* is a harmless saprophyte used as class material in laboratories. The wheat eelworm, *Anguina tritici,* is best known for its ability to remain dormant in the dry wheat kernel, having been revived after 20 years of dormancy. The Guinea worm, *Dracunculus medinensis,* is the most ancient known parasite of man, since the plague of fiery serpents visited upon the Israelites (Num. 21:6-9) is supposed to have been caused by this parasite. The Guinea worm reaches several feet in length, and at maturity it is coiled just under the skin where it causes a blister. To avoid blood poisoning, treatment involves extraction of the nematode without breaking. Moses is supposed to have set up the brass serpent to impress upon his people the need for complete extraction.

General Morphology.—Basically cylindrical animals; form of gravid females sometimes modified, *i.e.,* fusiform, saclike, or pear-shaped; bisexual, males commonly less numerous and smaller than females.

External covering, a simple or complex, noncellular cuticle, striated or annulated in some forms and often bearing setae (free-living forms). Beneath this layer there is a cellular or syncytial hypodermis, which commonly projects into the body cavity in the form of lateral and median chords; the latter contain the longitudinal nerves and the lateral excretory tubes. Laterally or sublaterally situated unicellular hypodermal glands may empty externally through cuticular pores. Aquatic species usually have a terminal caudal pore through which caudal glands extrude an adhesive thread. A single layer of longitudinal unstriated muscle cells is situated beneath the hypodermis and between the chords. Thus the body wall is composed of three layers, the cuticle, hypodermis and somatic musculature. The body cavity is not segmented but is often traversed by specialized muscles, *i.e.,* male copulatory muscles, vulvar muscles and somato-intestinal muscles. Pseudocoelomic membranes and mesenteries form an incomplete lining of the body cavity, covering musculature to a greater or lesser extent and supporting the reproductive system and digestive tract, which otherwise floats freely in the liquid-filled body cavity. There is no circulatory system.

The tubular digestive tract consists of the anterior terminal oral opening, the mouth cavity or stoma, oesophagus, oesophago-intestinal valve, intestine, intestino-rectal valve, rectum and ventral or subterminal anus in the female. In the male the rectum and gonoducts empty into a common cloaca. All parts of the digestive tract except the intestine are lined with cuticle, which is apparently of ectodermal origin.

The oral opening is usually surrounded by three or six lips bearing six groups of tactile papillae and two lateral pores, the amphids, which are supposed to be chemical sense organs. In some forms the oral opening is directly followed by the oesophagus, while more commonly there is a cylindrical, prismoidal or capsuliform stoma. The stoma may contain a protrusible hollow spear or stylet. In other forms the stoma may contain variously formed teeth. The oesophagus is basically a triradiate, syncytial, muscular, sucking organ often equipped with a valvular sucking bulb. Digestive glands and nerve cells are situated within the syncytial musculature. The oesophageal glands open into the lumen of the oesophagus. The general form of the oesophagus and the position of oesophageal gland orifices are much used in taxonomic work. The intestine is composed of a single layer of low cuboidal to columnar epithelial cells usually bearing an internal "bacillary border," homologous with cilia in other organisms. Usually the intestine is a simple tube, but occasionally there are outpocketings or caecae, and rarely it becomes atrophied or is transformed into a solid storage organ, the trophosome. Rectal or cloacal glands usually empty into the digestive tract just posterior to the intestino-rectal valve.

The female reproductive system is composed of two, one, or rarely three to many tubular ovaries continuous with uteri opening into a single vagina with vulvar orifice on the ventral side of the body, between the excretory pore and the anus. Sexes are usually separate but occasionally parthenogenic or hermaphroditic forms occur, in which latter case sperm are produced by ovarian cells and males are not necessary in reproduction.

The male reproductive system is composed of one or two tubular testes continuous with seminal vesicle, *vas deferens* and ejaculatory duct, opening ventrally with the rectum into a common cloaca. Secondary male sexual organs, the paired (or single) sclerotized spicules, are formed in the dorsal wall of the cloaca. These are inserted into the female during copulation. Sometimes the cuticle of the caudal region of the male is expanded in the form of caudal alae or a bursa (supported by muscular rays), which aids in copulation.

The nervous system is composed of a group of ganglia in the cervical region joined by a perioesophageal ring or commissure, from which six nerves extend anteriad to tactile cephalic papillae and to the amphids or chemoreceptors. The ventral nerve, situated in the hypodermis, extends posteriad from the nerve ring to the anal region and contains several ganglia; it is connected by hypodermal commissures with the dorsal and lateral nerves which are also situated in the hypodermis. Sublateral and caudal or genital tactile papillae are often present, and in one class, the Phasmidia, there is a pair of posterior lateral chemoreceptors, the phasmids.

The excretory system may take the form of a single ventral gland cell or a more complex closed lateral tube system, but in either case it opens ventrally through a cervically situated excretory pore.

Development.—Nematodes may be oviparous, viviparous or ovoviviparous; cleavage is determinate, each of the first few cells being destined to form a specific part of the body. The larva, at hatching, commonly resembles the adult except in those forms of parasites in which the stoma and oesophagus of the free-living saprophytic larva become modified in keeping with new feeding habits in the parasitic stages (*e.g.*, hookworm, *Ancylostoma duodenale*). Growth is marked by a series of cuticular moults (usually four), without internal reorganization. The gonads develop in the body cavity and attain connection with the vulva in the female and cloaca in the male at the time of the last moult. Free-living nematodes tend to produce only a few young, one at a time; each uterus usually contains from one to ten eggs, and both uterus and ovary are relatively short tubes with not more than one flexure. As parasitism becomes more advanced, there is an increase in egg production correlated with extensive coiling and complexity of the ovaries and uteri.

Plant-parasitic nematodes may remain dormant in soil, passing the winter in the egg stage, hatching in the spring to infect new hosts (the root knot nematode, *Heterodera marioni*); the eggs may be encased in a cyst formed by the body of the dead mother (the golden nematode of potatoes, *H. rostochensis*), in which case they may remain dormant five to ten years in the absence of the proper host plant; in other cases it is the fourth-stage larva which has the ability to lie dormant (the wheat eelworm, transmitted in the seed itself). Plant parasites all appear to have some period in their life in which stopover privileges are provided.

Animal-parasitic nematodes usually have a period of development outside the final host. The eggs may have a period of incubation outside the host, after which they hatch when swallowed with contaminated feed or water (*Ascaris lumbricoides*); they may hatch in faeces, feed as saprophytes passing through required growth stages and then infect the final host by active penetration of the skin (*Ancylostoma duodenale*, cause of ground itch), or they may be taken in orally with contaminated feed (grass in the case of trichostrongyl parasites of ruminants). The life history is said to be direct if only one host is required. Development is indirect when eggs or larvae must first enter another or intermediate host, there undergoing required growth stages before infecting the final host. This is the case in the Guinea worm, whose larvae infect the water flea, *Cyclops*, and are finally acquired by man when he swallows the infected *Cyclops* in drinking water. Finally there is the type of indirect development represented by *Wuchereria bancrofti* (cause of filariasis in man) and *Dirofilaria immitis* (cause of heartworm in dogs); in these cases the parasites pass their larvae into the blood stream, from which they are acquired by biting insects (mosquitoes), and, after passing growth stages in the intermediate host, re-enter the final host through the skin. Animal parasites may immediately take up residence in that part of the final host in which they mature (*Enterobius vermicularis*, the pinworm of man), or they may go through extensive migrations, from the intestine, through the blood stream to the lungs, then be coughed up and swallowed before settling down in the intestine (*e.g.*, *Ascaris lumbricoides*). Some of the most extensive damage is done to the host in the migrations.

Classification.—Class Phasmidia. Nematodes with lateral caudal pores, phasmids, simple porelike amphids, a tubular excretory system. Hypodermal glands, setae and caudal glands absent.

Order Rhabditida.—Oesophagus essentially consisting of three parts: corpus, isthmus and bulbar region (at least in larval stages).

Suborder Rhabditina.—Vagina transverse, simple reproductive system. Free-living primitive parasites of animals, all plant parasites.

Superfamily Rhabditoidea.—Stoma not styletiform, oesophagus three-part in adult stage. Saprophytic (Rhabditidae, Cephalobidae, Cylindrogasteridae, Diplogasteridae [*Turbatrix aceti*]); parasites of molluscs and amphibians (Angiostomatidae), parasites of earthworms (Drilonematidae), of insects (Steinernematidae), and parasites of vertebrates with alternation of generations, one generation saprophytic, other parasitic (Rhabdiasidae, Strongyloididae).

Superfamily Tylenchoidea.—Stoma styletiform, oesophagus three-part in adult stage, but musculature often degenerate. The family

FIG. 2.—RHABDITIS STRONGYLOIDES (CROSS SECTIONS, DIAGRAMMATIC)
A—Head; B—Stomatal region; C—Oesophageal region; D—Anterior intestinal region; E—Posterior region of male. *ar*, arcade; *cn*, cephalic nerve; *s*, sensilla of amphid; *dn*, dorsal nerve; *ex gl*, excretory gland cell; *lc*, lateral canal of excretory system; *vn*, ventral nerve *ejl*, ejaculatory gland; *vd*, vas deferens; *amph*, amphid; *amph n*, amphidial nerve

Tylenchidae includes all known plant-parasite nematodes, the better-known being the root-knot nematode, *Heterodera marioni* (with more than 1,000 host plants); the stem-and-bulb eelworm, *Ditylenchus dipsaci*; the chrysanthemum nematode, *Aphelenchoides oleisistus*; and the wheat eelworm, *Anguina tritici*. This group feeds by inserting the stylet into plant cells and sucking the juices. Economic losses caused by the nematode parasites of plants probably exceed those due to animal parasites, though they are less spectacular. There is scarcely a single cultivated crop in any part of the world that is not limited in its production or extensive use because of injuries sustained or anticipated from plant-parasitic nematodes. "Land sickness" is often due to building up of heavy nematode soil populations. The Tylenchoidea also include the Allantonematidae, which are parasites of insects, the insects becoming infected through the ingestion of eggs or larvae and the larvae then penetrating the intestinal wall to reach the body cavity or gonoducts, where they reach adulthood.

Suborder Strongylina.—Vagina tubular, reproductive system highly developed. Oesophagus of adult never terminated by bulbar swelling, lips usually rudimentary. Parasites of vertebrates in adult stage, young larvae usually saprophytic in soil or faeces, final host infected orally or through skin. Earthworms, molluscs and arthropods occasionally act as vectors.

Superfamily Strongyloidea.—Stoma well developed, body usually thick. Families Strongylidae and Ancylostomatidae (inhabit intestine, *e.g.*, hookworms), Syngamidae (urinary or respiratory system, *e.g.*, gapeworms), Cloacinidae and Diaphanocephalidae (intestine of marsupials and reptiles, respectively).

Superfamily Trichostrongyloidea.—Stoma rudimentary, body thin. Parasites of digestive tract of all groups of vertebrates. Families Trichostrongylidae and Heligmosomidae.

Superfamily Metastrongyloidea.—Stoma rudimentary, body thin. Parasites of respiratory system of mammals. Families Metastrongylidae and Pseudaliidae.

Suborder Ascaridina.—Vagina tubular, reproductive system highly developed; oesophagus of adult usually terminated in bulbar swelling; three or six lips, generally well developed. Parasites of digestive tract of arthropods or vertebrates in adult stage; infection usually direct. Families Thelastomatidae and Rhigonematidae (parasites of arthropods); Oxyuridae (*e.g.*, *Enterobius vermicularis*, pinworm of man), Atractidae, Cosmocercidae, Kathlaniidae, Heterakidae, Quimperiidae and Ascarididae (*e.g.*, *Ascaris lumbricoides*), include parasites of all groups of vertebrates.

Order Spirurida.—Oesophagus divisible into two regions, a narrow muscular anterior part and a wide, glandular, posterior part; vagina tubular; adults parasitic in vertebrates, larvae in arthropods.

Suborder Camallanina.—Oesophageal glands uninucleate, phasmids of larvae pocketlike; intermediate hosts, copepods. Families Camallanidae and Cucullanidae, with well developed stoma, parasites of digestive tract of fish, amphibia and reptiles; families Dracunculidae (*e.g.*, Guinea worm) and Philometridae, with rudimentary stoma, tissue parasites of vertebrates.

Suborder Spirurina.—Oesophageal glands multinucleate, phasmids of larvae porelike; intermediate hosts, arthropods. Parasites of all parts of body of all groups of vertebrates; those with a well-developed stoma or lips usually inhabit digestive tract in adult stage (families Thelaziidae, Spiruridae, Acuariidae, Gnathostomatidae and Physalopteridae), and are usually transmitted by scavenger insects or copepods; those with rudimentary stoma and lips inhabit tissues or the blood stream and are transmitted by sucking insects, *i.e.*, mosquitoes, stable flies (families Dipetalonematidae, Stephanofilariidae, Desmidocercidae and Filariidae, *e.g.*, heartworm).

Class Aphasmidia.—Nematodes without lateral caudal pores (phasmids), amphids often externally modified, excretory system absent or not tubular; hypodermal glands, setae and caudal glands commonly present; caudal alae usually absent.

Order Chromadorida.—Amphids basically spiral or circular, subventral oesophageal glands opening in mid-region of oesophagus, posterior part of oesophagus not greatly elongated, usually bulbar. Free-living in soil, fresh water or marine, rarely commensal.

Suborder Monhysterina.—Oesophago-intestinal valve vertically flattened or circular, ovaries outstretched or reflexed. Amphids uni- or dispiral, ovaries reflexed, ends of oesophageal lumen tuboid: families Plectidae and Camacolaimidae. Amphids spiral, ovaries outstretched, ends of oesophageal lumen tuboid: families Axonolaimidae and Comesomatidae. Amphids circular, ovaries outstretched, ends of oesophageal lumen convergent: families Monhysteridae, Linhomoeidae and Siphonolaimidae.

Suborder Chromadorina.—Oesophageal-intestinal valve basically triradiate; ovaries reflexed; amphids circular spiral or vesiculate. Includes families Desmoscolecidae and Greeffiellidae, with vesiculate amphids, coarsely annulated cuticle and tubular gland setae; families Desmodoridae, Epsilonematidae and Draconematidae, with basically spiral amphids, and annulated cuticle; and families Chromadoridae, Cyatholaimidae, Microlaimidae and Tripyloididae, with basically spiral amphids, cuticle punctate or finely striated.

Order Enoplida.—Amphids pocketlike or porelike (parasites), oesophagus cylindrical, conoid or greatly elongated posteriad.

Suborder Enoplina.—Dorsal oesophageal gland opens into stoma, sublateral rows of somato-intestinal muscles absent. Free-living, aquatic or terrestrial. Includes families Enoplidae, Oncholaimidae and Ironidae, with subventral glands opening into stoma; and families Tripylidae, Mononchidae and Alaimidae, with subventral glands opening into mid-region of oesophagus.

Suborder Dorylaimina.—Mouth with protrusible stylet, sublateral rows of somato-intestinal muscles absent, dorsal and subventral glands opening into mid-region of oesophagus. Includes families Dorylaimidae, Leptonchidae and Diphtheroporidae, which are free-living, usually terrestrial or fresh water, with well-developed oesophageal musculature. Families Mermithidae and Tetradonematidae, larval stages parasitic in arthropods, adult free-living in soil or fresh water but do not feed; oesophagus degenerate, glands reduplicate in double chain of cells. Families Trichuridae, Trichinellidae (*Trichinella spiralis*) and Cystoopsidae, adults parasitic in vertebrates, posterior part of oesophagus degenerate with reduplicate glands usually in single chain; with direct life history, eggs infective (*Trichuris*); with indirect life history, arthropods or annelids serving as intermediate hosts (*Cystoopsis*, *Capillaria*); with indirect life history, larvae in muscles of first mammal, orally infective to second mammal (man), in which adult matures and larvae migrate from intestine to muscles (*Trichinella spiralis*).

Suborder Dioctophymatina.—Dorsal and subventral oesophageal glands opening into stoma; four sublateral rows of somato-intestinal muscles. Adults and late larval stages parasitic in vertebrates, young larval stages parasitic in arthropods. Families Sobolophymatidae and Dioctophymatidae (*e.g.*, *Dioctophyma renale*, kidney worm of man). (B. G. C.)

NEMATOMORPHA (Gordiacea or "hairworms"), a group of elongate, thread-like, unsegmented worms, probably related to the Nematoda (*q.v.*), but differing from them in certain respects. The adults occur mainly in fresh water (occasionally in wet earth), and are sometimes found in tangled masses. The species vary in length from a few inches to two or three feet, but none are thicker than whipcord. They are usually of a brownish colour.

The body-wall consists of (1) a stout cuticle, with an outer layer (smooth or with shagreen-like "areoles," sometimes bearing spines or bristles of various kinds) and an inner layer of obliquely crossed fibres; (2) a single subcuticular layer of cells; and (3) a layer of longitudinal muscle-fibres. Most of the space within the body-wall is filled with parenchymatous tissue, in which the internal organs are embedded. There is an alimentary canal, opening posteriorly into a cloaca together with the genital ducts. A

mouth is usually absent in the adult. No circulatory or excretory organs are known. There is a single ventral nerve-cord, with anterior and posterior ganglia.

The sexes are separate, the males being usually smaller than the females and, in some genera, distinguishable by having the tail bifurcate. The tail of the female is usually undivided, but in *Paragordius* it has three prongs. The gonads are paired in both

FIGS. 1 AND 2.—GORDIID WORMS (MAGNIFIED)

1. Abdomen of a beetle (*Pterostichus niger*), with the terga removed, showing a gordiid worm within
2. A female gordiid worm depositing its eggs on a water plant

sexes, and are continuous with their ducts. In the gravid female the ovaries give off thin-walled lateral pockets, which ultimately break down and discharge the ova into spaces in the parenchyma. The eggs, held together by a cement-like substance, are laid in strings or masses, usually on plants or stones under water. The first larval stage is a minute creature armed with spines and having a boring organ anteriorly, by means of which it enters a host (usually an aquatic animal). In species which attack insects such as grasshoppers, the second larval stage may apparently be reached without change of host. In others it may develop in a second host, usually a beetle, which preys upon the first. The second larval stage is elongate and worm-like, and develops directly into the adult form. Pigment is developed, and the larval cuticle shed, just before emergence from the host. This usually takes place on contact with water, the worm bursting its way out through a soft place in the body-wall.

The group includes the genera *Gordius, Paragordius, Chordodes* and *Parachordodes,* to which a fifth, *Gordionus,* has been added by G. W. Müller. It is still uncertain whether *Nectonema* (a pelagic marine form provided with rows of bristles) is more closely related to this group or to the Nematoda. (H. A. B.)

NEMEA, BATTLE OF, 394 B.C. This was the decisive battle, in the sense that it broke the force of the hostile offensive, of the "Corinthian War," against Sparta, waged by the coalition of Thebes, Corinth, Athens and Argos, but instigated by Persia. In its initial pattern it was the typical frontal battle of the time, and both lines as they advanced experienced the characteristic "drift" to the right, so that each right wing overlapped the opponent's left wing. Thus on one flank the Spartans dispersed the Athenians, and on the other Sparta's allies were shattered by the Argives and Corinthians. Then, however, the Spartans, instead of pursuing blindly ahead like Clearchus and his men at Cunaxa, checked their pursuit and caught in flank three successive bodies of the enemy as they were marching back to their base. With this success the menace to Sparta waned, and the initiative in further operations passed to her. (*See* further CUNAXA, BATTLE OF, 401 B.C.; CORONEIA, BATTLE OF.)

NEMERTEA (NEMERTINEA). The nemerteans, or nemertines, commonly called ribbon worms, which constitute the invertebrate phylum Nemertea, are characterized by the soft, extensible, ciliated body, without external indication of segmentation and without distinct body cavity, the internal organs being separated by gelatinous parenchyma; the body is provided with a highly specialized eversible proboscis and a usually straight intestine opening at the posterior end of the body (fig. 1). There are no external appendages except the caudal cirrus, sucker and tentacles, found in a few species.

Nemerteans vary greatly in size and shape; some are long, flattened and ribbonlike and may grow to a length of 1 to 4 metres (fig. 3); others are threadlike and from a few millimetres to several metres in length when mature; some are cylindrical (fig. 2); others are broad and flat. In nearly all forms the body may be contracted to a small fraction of the length which it has in full extension.

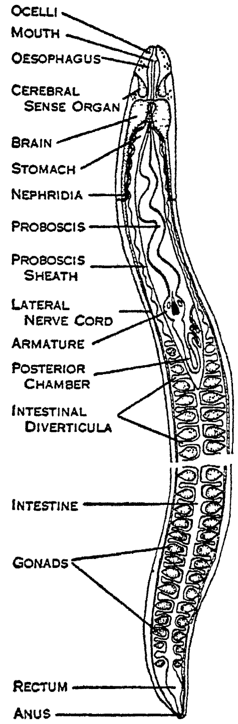

FIG. 1.—ORGAN SYSTEMS OF A HOPLONEMERTEAN

Most of the species are marine and littoral; many of them burrow in sand or mud; others hide beneath stones or creep about among algae and other growths between tide marks or in shallow water. The members of the tribe Pelagica are strictly bathypelagic, with flattened, gelatinous bodies adapted for floating idly or swimming sluggishly far beneath the surface of the deep oceans. A few species inhabit fresh-water streams and lakes; others have migrated to the land, living in moist earth or beneath fallen logs, stones or dead foliage. Certain species live as commensals in the mantle cavities of pelecypods or of tunicates, in the canals of sponges or beneath actinians; and finally there are several species which are parasitic on the gills and among the egg masses of crabs.

The nemerteans are all carnivorous, feeding on protozoa, turbellarians and other worms, molluscs, crustaceans and the young of all the invertebrates with which they come in contact. Some have such distensible mouths that they can devour animals of almost their own diameter. Others have small mouths and suck in only the juices of their prey.

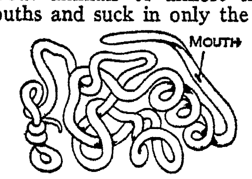

FIG. 2.—A PALEONEMERTEAN, PROCEPHALOTHRIX SPIRALIS

When food is not obtainable the nemertean is able to live for a long time upon the nourishment to be obtained from its own tissues. Individuals of some species may thus survive starvation for a year or more. In the meantime the body may have shrunk to a small fraction (1/20 or less) of its former size. Some of the small forms may survive unfavourable conditions by coiling their bodies in a firm cyst of secreted mucus, to resume activity at a later time.

Many of the species are brightly coloured in life, with shades of red, orange, yellow, green, gray and brown predominating. Some have a uniform coloration, while others have definite patterns or markings of contrasting colours, with rings, longitudinal lines, spots or reticulations. The physical basis of the colour patterns consists of pigment granules secreted within the epithelial cells of the integument or in the underlying connective tissue cells or both.

Morphology and Physiology.—The morphological character-

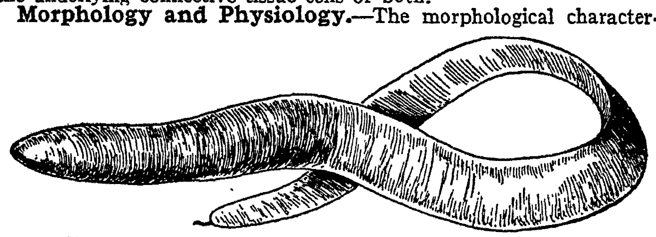

FIG. 3.—A HETERONEMERTEAN, CEREBRATULUS MELANOPS

istics of a nemertean are shown in fig. 1. Although there is no external indication of segmentation, most of the internal organs are arranged metamerically. The body is covered with a layer of ciliated epithelial cells, interspersed with mucous and sensory cells. The epithelium is supported on a basement layer of firm gelatinous tissue, beneath which, in the Heteronemertea, is a thick layer of mucous glands and connective tissue, the cutis. The musculature of the body wall consists of two or more layers of circular, spiral and longitudinal muscles which enable the worm to carry on rapid changes in body form. Locomotion is accomplished by creeping or gliding, by alternate elongation and contraction, by twisting spirally or, in a few species, by swimming.

The proboscis is sometimes used as an aid in creeping or burrowing.

The *proboscis* is formed by an invagination of the anterior body wall and consequently has essentially the same muscular and epithelial layers but in reverse order. In its normal position within the body it lies within the proboscis sheath, which forms a closed, saclike cavity, the rhynchocoel, filled with a corpusculated fluid. In a few species of hoplonemerteans the sheath is provided with paired diverticula. The anterior end of the proboscis is anchored firmly into the tissues of the head near the brain, while the posterior end commonly terminates in a long retractor muscle attached to the proboscis sheath or in some species to the musculature of the body wall in addition. The proboscis is everted through the rhynchodeum by the combined action of its own muscles and such contractions of the musculatures both of the sheath and body walls as will exert pressure on the fluid in the rhynchocoel. It is withdrawn by reducing this pressure, aided by its own musculature and by the retractor muscle, if present. In the Anopla the tenacious mucus and paralyzing secretions of the everted proboscis aid in capturing the prey, while in the Enopla the stylet is also used. Most of the Enopla have two or more pouches of accessory stylets which may replace the central stylet if lost or broken (fig. 4). In the heteronemertean *Gorgonorhynchus* the proboscis is dichotomously branched.

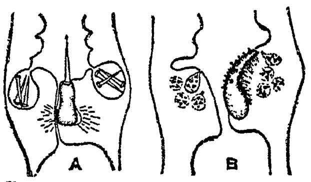

FIG. 4.—PROBOSCIS ARMATURE IN (A) AMPHIPORUS GRISEUS, A REPRESENTATIVE OF THE MONOSTYLIFERA AND IN (B) PELAGONEMERTES BRINKMANNI, A REPRESENTATIVE OF THE POLYSTYLIFERA

The *digestive system* consists of an anterior mouth which may either open ventrally posterior to the brain or terminally in connection with the proboscis opening. In the Bdellonemertea and some Hoplonemertea the mouth joins the rhynchodeum to form an atrium. The mouth leads to a slender œsophagus and thence to a more spacious stomach. The intestine continues as a straight tube, usually with numerous paired lateral diverticula, from the stomach to the rectum, which opens at the posterior end of the body (fig. 1). Some forms have a large caecum, with caecal diverticula, which extends forward from the anterior end of the intestine, while in some of the Paleonemertea and all of the Bdellonemertea there are no intestinal diverticula whatever (fig. 5). Digestion of the food materials is accomplished mainly by enzymes secreted into the stomach and intestine, although the fats are taken by phagocytosis directly into the cells of the lining epithelium. In these cells also the nutrients are stored in vacuoles until needed in the body metabolism.

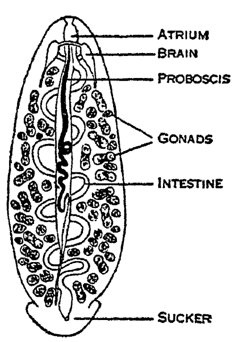

FIG. 5.—ORGAN SYSTEMS OF A BDELLONEMERTEAN

The *circulatory system* consists typically of three longitudinal blood vessels, united at both ends of the body, and in most species with reservoirs, or lacunae, in the head and œsophageal region and with numerous anastomosing cross branches throughout the body.

The *excretory system* is highly diversified. Typically there is a pair of profusely branching nephridia in close proximity with the lateral blood vessels and having one or more pairs of efferent ducts leading to the exterior of the body (fig. 1). Each of the numerous minute branches originates from a multinucleate terminal organ (metanephridium) or from a single cell (protonephridium) with long flagella which draw fluid from the surrounding parenchyma into the nephridial canal. Other cells in the walls of the canals excrete metabolized waste products. In the terrestrial nemerteans (*Geonemertes*) there are several thousand separate nephridia, each with its own efferent duct. Excretory organs have not been found in any of the bathypelagic species.

Nervous System.—The central nervous system consists of a four-lobed brain, from which a pair of large lateral nerve cords extend to the posterior end of the body. Many species have in addition a dorsomedian and a ventromedian nerve with branches communicating with the lateral nerve cords. Connected with the central nervous system are one or more pairs of proboscidial nerves and numerous, often paired, peripheral nerves associated with the muscular and digestive systems, integument, ocelli and such other sense organs as may be present.

Sense Organs.—In addition to the sensory epithelium everywhere present in the integument, some of the species have other specialized sense organs, including ocelli, cerebral, lateral and frontal sense organs, cephalic grooves and pits. In a single family (Ototyphlonemertidae) there is a pair of statocysts connected with the brain. With the exception of these organs of equilibrium and the ocelli very little experimental evidence has been obtained as to the precise nature of the sense organs. Chemical senses, including the recognition of food substances, positional sense, tactile sense and a certain degree of light sense must be located in the epithelium on all parts of the body, for headless fragments respond to the corresponding stimuli.

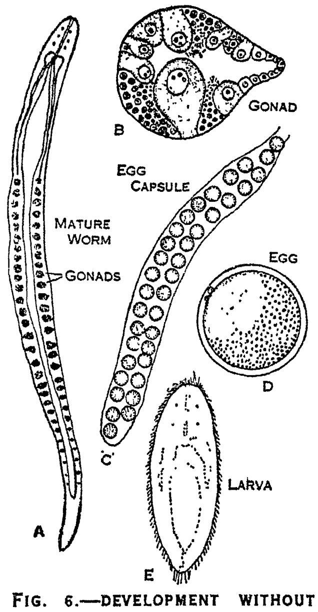

FIG. 6.—DEVELOPMENT WITHOUT METAMORPHOSIS IN A HOPLONEMERTEAN, PROSTOMA RUBRUM

Reproduction.—In most nemerteans the sexes are separate, although a few species are hermaphroditic. The gonads are simple sacs which usually alternate with the intestinal diverticula and may therefore be very numerous (figs. 1 and 6). In most species the sexual cells from each gonad are discharged directly into the water. Fertilization is thus external except for the few cases of viviparity in which the development of the embryo takes place within the body of the parent. There is evidence of sex recognition in some species, for a male and a female may be found side by side in a sheath of mucus. After ovulation and fertilization the parents leave the sheath which then forms a capsule for the developing embryos (fig. 6). In a few of the bathypelagic nemerteans the spermaries have been shifted to the head, and in the parasitic *Carcinonemertes* there is a common sperm duct which opens into the rectum.

Embryonic development may be direct, leading to the formation of a larva similar to the adult (fig. 6), or it may be indirect, with a free-swimming, hemispherical larva of complicated pattern known as the pilidium (fig. 7). The young worm later develops by metamorphosis within the pilidium. Increase in length occurs by constant additions to the posterior end of the body.

Regeneration.—Enemies are numerous, particularly annelids, crustaceans and fishes. Contributing to survival, however, is the tendency of most individuals with long bodies to break in fragments whenever any part of the body is seized. If only the posterior portion of the body is lost the missing parts are soon restored by regeneration. In certain species, any small fragment of the body, with or without the head, will regenerate into a minute worm of normal proportions (fig. 8). Fragmentation thus becomes a method of asexual propagation. Only a few species, however, have the capacity of restoring a missing head, but a lost or injured proboscis is promptly replaced.

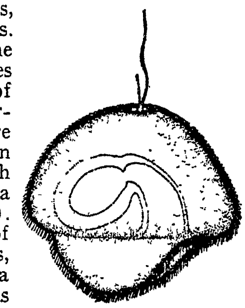

FIG. 7.—PILIDIUM OF A HETERONEMERTEAN, CEREBRATULUS

Classification.—Approximately 570 species of nemerteans had been described previous to 1946. Nearly 200 of these are found along the coasts of Europe, 100 on the Pacific coast of North America, 54 on the Atlantic coast of North America and 57 are bathypelagic, floating far beneath the surface of the oceans.

The phylum is conveniently divided into two classes, each of which consists of two orders.

CLASS 1. ANOPLA. Mouth posterior to brain; central nervous system imbedded in body wall, either between the muscular layers or external thereto; proboscis not armed with stylets.

Order 1. PALEONEMERTEA. Body musculature of either two or three layers; cutis absent. Example, *Procephalothrix* (fig. 2).

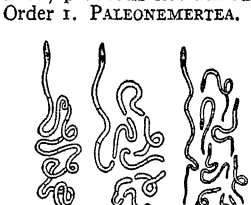

FIG. 8.—ASEXUAL REPRODUCTION BY FRAGMENTATION, LINEUS SOCIALIS

Order 2. HETERONEMERTEA. Body musculature of three layers, to which a thin inner circular and an outer spiral layer are sometimes added; cutis well developed. Examples, *Lineus* (fig. 8), *Cerebratulus* (fig. 3).

CLASS 2. ENOPLA. Mouth anterior to brain; central nervous system situated in parenchyma internal to body musculature; proboscis (except in Bdellonemertea) armed with one or more calcareous stylets.

Order 3. HOPLONEMERTEA. Proboscis with armature; intestine straight, with paired lateral diverticula; sucker absent.

Suborder 1. Monostylifera, with single stylet on awl-shaped basis. Examples, *Amphiporus* (fig. 4A), *Prostoma* (fig. 6).

Suborder 2. Polystylifera, with several stylets on curved basis.

Tribe 1. Reptantia, adapted for creeping or burrowing.

Tribe 2. Pelagica, adapted for swimming or floating in the ocean depths. Example, *Pelagonemertes* (fig. 4B).

Order 4. BDELLONEMERTEA. Proboscis without armature; intestine convoluted, slender, without diverticula; with sucker at posterior end

of body. Commensal in marine pelecypods. Example, *Malacobdella* (fig. 5).

Geographical Distribution.—Nemerteans are found along all the seacoasts of the world and off the shores to depths of hundreds of metres. Some of the species are circumpolar, extending southward along the coasts as far as Madeira, southern New England, California and Japan. A few species live in both the northern and southern hemispheres. Some are limited to the polar seas and others to the tropics. Some of the bathypelagic species live at depths of 1,000 to 2,000 metres or more and the population may be carried for thousands of miles by the deep ocean currents, reproducing generation after generation in their endless circuits throughout the great oceans.

NEMESIANUS, MARCUS AURELIUS OLYMPIUS, Roman poet, a native of Carthage, flourished about A.D. 283. He was a popular poet at the court of the Roman emperor Carus (Vopiscus, *Carus*, 11). He wrote poems on the arts of fishing (*Halieutica*), aquatics (*Nautica*) and hunting (*Cynegetica*), but only a fragment of the last, 325 hexameter lines, has been preserved. It is neatly expressed in good Latin, and was used as a school text-book in the 9th century. Four eclogues, formerly attributed to Titus Calpurnius (*q.v.*) Siculus, are now generally considered to be by Nemesianus, and the *Praise of Hercules*, generally printed in Claudian's works, may be by him.

Complete edition of the works attributed to him in E. Bährens, *Poetae Latini Minores*, iii. (1881) and J. P. Postgate's *Corpus Poetarum Latinorum*, ii.; *see* also L. Cisorio, *Studio sulle Egloghe di N.* (1895) and *Dell' imitazione nelle Egloghe di N.* (1896); and M. Haupt, *De Carminibus Bucolicis Calpurnii et N.* (1853), the chief treatise on the subject.

NEMESIS. (1) A goddess worshipped at Rhamnus in Attica. She is closely connected with Artemis, probably a local form of her or of some other very similar goddess. In mythology (posthomeric; the story is told in the cyclic *Cypria*) she is loved by Zeus who catches her after a transformation-race; she lays an egg, from which Helen (*q.v.*) is hatched out, generally by Leda (*q.v.*), it is a disputed point whether Leda or Nemesis is the mother of Helen in the original form of the story. There seems also to have been a legend (Catullus, lxiv., 393) that on some occasion (Marathon?) she appeared in person to encourage her worshippers in battle. (2) The indignant disapproval felt at wrong-doing; in particular, such disapproval on the part of the gods, and the consequent punishment of a sinful (or over-prosperous) man, hence (first in Hesiod) that disapproval personified. There was an old cult of "the Nemeseis" at Smyrna (Pausanias, ix., 35–36) but whether of this abstraction or of the fertility-goddess of Rhamnus, is not clear. That the abstraction was worshipped, at least in later times, is beyond doubt, however; a fragment of Antimachus (in Strabo, xiii., 1, 13) says that Adrastus was the first to erect an altar to her. In Rome especially her cult was very popular, particularly among soldiers, by whom she was worshipped as patroness of the drill-ground (Nemesis campestris); associated with Fortune, she seems also to have been adored as presiding over races; she had a cult-association, the Nemesiaci.

(H. J. R.)

NEMESIUS (*fl. c.* A.D. 390), a Christian philosopher, author of a treatise περὶ φύσεως ἀνθρώπου (*On Human Nature*), was, according to the title of his book, bishop of Emesa (in Syria). His book is an attempt to compile a system of anthropology from the standpoint of the Christian philosophy. Moses and Paul are put side by side with Aristotle and Menander, and there is a clear inclination to Platonic doctrines of pre-existence and metempsychosis. In physiology he is in advance of Aristotle and Galen, though we can hardly assert—as has sometimes been thought—that he anticipated Harvey's discovery of the circulation of the blood.

Editions: Antwerp 1575; Oxford, 1671; Halle, 1802; Migne's *Patrol. Gr.* vol. 40. Versions: Latin by Alsanus, ed. Holzinger (1887); by Burgundio, ed. Burkhardt (1891–96). Literature: Bender, *Untersuch. über Nemesius* (1898).

NEMOPHILA, a genus of North American herbs of the water-leaf family (Hydrophyllaceae), comprising some 20 species found chiefly in the Pacific coast region, 13 of which are native to California. They are more or less diffuse annuals, with parted, divided or lobed leaves, and delicate blue or white flowers, blossoming in early spring. Several are grown as border plants, especially the baby blue-eyes (*N. insignis*) and the five-spot (*N. maculata*). Other interesting species are the climbing nemophila or fiesta-flower (*N. aurita*), the small white nemophila (*N. heterophylla*) and the small flowered nemophila (*N. parviflora*), the last named ranging from California to Washington.
